THE METAL WORKER.

NEW YORK AND CHICAGO.

Saturday, January 6, 1894.

DAVID WILLIAMS, - PUBLISHER

BUSINESS OFFICES:

NEW YORK.....96-102 Reade Street.
PHILADELPHIA.....220 South Fourth Street.
BOSTON.....146 Franklin Street.
PITTSBURGH..... Room 509 Hamilton Building.
CHICAGO.....59 Dearborn Street, cor. Randolph.
CINCINNATI.....Rooms 22-24 Pickering Building
ST. LOUIS.....Bank of Commerce Building.
CLEVELAND.....312 The Cuyahoga.

BRITISH AGENCY: The Ironmonger, 42 Cannon street, London, England.

An Annual Review.

We mark the beginning of the year by publishing brief reviews of the different trades with which the readers of *The Metal Worker* are concerned. These reviews are largely based on reports that have come to us from correspondents in all parts of the country, and therefore may be considered to fairly reflect the conditions prevailing throughout the United States. The year has been far from satisfactory in the majority of trades. The two causes generally assigned for the trouble are the silver disturbance of the early summer and the threatened tariff changes of the autumn. Public confidence was upset at the beginning of summer, and before it had time to recover itself the tariff agitation came to unsettle again the industrial situation. In spite of the disastrous experience of the year it is reassuring to know that the silver matter is not again likely to trouble the country, and that the disturbance from this cause has definitely ceased. The tariff question now remains for settlement, and we believe that it will be generally conceded that the chiefest evil in connection with this is the agitation of the subject. There are more manufacturers and business men who pray for a final and settled tariff than there are who pray for either high or low tariff. The evil effect that this disturbance causes is inestimable, and the United States will suffer untold losses if the duties are to be enacted and revoked and re-enacted, with all sorts of variations every few years. The prime element of prosperity is stability, and stability in values perhaps more than anything else. This cannot be so long as the imposts levied by the custom house are liable to frequent and great fluctuations.

A Word of Greeting.

We cannot let the season of the new year go by without offering to the readers of *The Metal Worker*, one and all, our good wishes for the year to come. It is usual at this time to make plans for the future, no less in a trade journal than in other lines of business. We hope to continue *The Metal Worker* in its upward course, and we have planned to provide our readers with a weekly publication which, we trust, will both interest and instruct them It will be our endeavor to increase its excellence in each and every department, and, so far as lies in our power, meet every want and fulfill every new requirement. We shall continue to depend largely upon the interest of our readers, upon their advice, suggestions and communications from them of all kinds. We will look for this assistance in the year to come, and we are persuaded that we will not look in vain. It is our wish to do the greatest good to the greatest number, and we are always glad to receive suggestions, even though they may be accompanied with fault finding. We will close this brief word to our friends as we began it—by wishing them a prosperous year.

The Fleetest Animal.

Through the aid of steam propulsion man has been able for half a century to travel swifter and, at the same time, more continuously than any other animal not capable of flying. It now appears that he is the fleetest animal—except some birds—when dependent for his propelling power solely upon his own muscular effort, and that he can maintain his efforts through a longer period than is probably sufficient to completely exhaust a horse, dog, deer or any other animal whose fleetness of foot is proverbial. The aid by which man as a self propelling animal has acquired the ability to distance the fleetest quadrupeds is the modern bicycle; and the extent to which this simple machine has added to his power of locomotion is shown by the astonishing records of the six-days' bicycle race in Madison Square Garden, New York City, which ended on the night of December 30, 1893.

Possibilities of Bicycle Travel.

The winner of the first place in this race—Schoch of Chicago—traveled 1600 miles in 142 hours, an average for the entire actual time of riding of a little more than $11\frac{27}{100}$ miles per hour. On the first day of the race, Waller of San Francisco made the marvelous record of 404 miles, being an average for the 24 hours, including all stops, of a little more than $16\frac{84}{100}$ miles per hour. It is not 30 years since such a speed would have been considered good on many railways. P. Berto made a single mile in 2 minutes $30\frac{3}{5}$ seconds, which has only been beaten by thoroughbred trotting horses, and the horse was never yet bred that could travel 50 miles in 2 hours 33 minutes and 53 seconds, a feat performed by Starbuck on the closing night of the race, being an average of a mile in 3 minutes $4\frac{4}{5}$ seconds, for the entire 50 miles, a feat probably never accomplished by any quadruped whatever. In view of these facts the possibility of a far more extended use of the bicycle as a means of propulsion does not appear so chimerical as it did a few years ago, when it was suggested that it might be of great use in effecting rapid military movements, and when experiments to demonstrate its value for this purpose were made in Europe. The bicycle of to-day, like most other things, is a very different affair from what it was a few years ago, and until it has been learned how to make and use a practical flying machine it is doubtful if any other method of traveling dependent upon the muscular power of man and affording the speed above recorded will ever be produced. It is probable, moreover, that the speed attained by the use of bicycles has not yet reached its limit, though it must have very nearly approached the limit, one would think.

Return Postage.

Many men who are punctilious in conforming to business usages often in writing letters to which they expect answers fail to inclose stamps to prepay postage on the reply. It would be better still to inclose an addressed stamped envelope with a written address. An inquiry will receive earlier attention and perhaps more careful attention if it involves but little trouble and no expense to the person addressed than if the latter is expected to do considerable work and foot the bill besides. This may seem a small matter—only 2 cents involved—but the principle of the transaction is apt to govern the person who is expected to reply. He is very apt to say to himself, "Well, if this man expects an answer he should at least have inclosed a stamp" There is very little danger of any one taking offense at such an inclosure. The inquirer who hesitates to inclose a stamp to a concern transacting a million dollars' worth of business a year because it is such a trifle may find upon reflection that the existence of that house depends upon an aggregation of two-penny profits. There are salesmen who at this time of the year are endeavoring to secure positions with other houses, and yet omit the inclosure of return postage on the reply which they unhesitatingly look for to their letter of application. If they receive answers to such unbusinesslike letters they are in luck, and they may be sure that something else has recommended them.

93962

than their correct observance of business civilities. The amount involved is of no consequence. Even if letter postage should be reduced to a penny, a stamp should still be inclosed to insure a reply.

Business Mortality in 1893.

Were it not that some important points can be gathered from the study of the statistics of business mortality in 1893 the subject would be promptly dismissed by those engaged in commerce, industry and finance. Post mortem examination is not pleasant, but may be instructive.

The two commercial agencies, *Bradstreet's* and *Dun's*, have made departures in their former methods in order to permit of the study in greater detail of the commercial failures which have taken place.

Dun's Review gives a classification showing separately the number, assets and liabilities in each State and section of manufacturing failures, trading failures, and "other" failures, including brokers and speculators. Besides they tabulate banks and financial failures, which are also classified. The aggregate results by sections are as follows, all former slave holding States being reckoned as the South, the three west of the Mississippi being called the Southwest and the States between Pennsylvania and the Mississippi being classed as Central:

	Manufacturing.		Trading.		Other.	
	No.	Liabilities. Thousands of dollars.	No.	Liabilities. Thousands of dollars.	No.	Liabilities. Thousands of dollars.
New England	482	$12,065	1,290	$14,820	24	$2,766
Middle	1,149	100,700	2,035	25,758	80	13,136
Southeastern	358	10,107	2,096	20,668	39	4,935
Southwestern	90	1,713	1,047	10,378	12	2,516
Central	664	28,139	1,387	19,682	55	6,452
Western	219	7,075	1,656	19,480	51	15,429
Pacific	264	4,908	1,172	9,269	41	1,428
Totals	3,226	$164,707	10,683	$120,055	302	$46,662

The following table shows by sections the total of banking and commercial failures together:

	Commercial.		Banking.	
	No.	Liabilities.	No.	Liabilities.
New England	1,798	$29,651,770	16	$12,546,000
Middle	3,263	139,594,553	35	43,478,618
Southeastern	2,493	35,709,419	82	22,119,514
Southwestern	1,149	14,606,509	61	29,703,776
Central	2,106	54,272,372	149	37,457,963
Western	1,926	41,982,422	218	39,554,298
Pacific	1,477	15,605,894	81	26,138,639
Totals	14,212	$331,422,939	642	$210,998,808

The banking and commercial failures together involved concerns whose aggregate assets were $497,443,700, while the liabilities amounted to $542,421,747. In addition thereto there went into the hands of receivers railroads whose total mileage was 25,375, representing a nominal stock interest of $674,412,487. It is estimated that their total indebtedness is $1,212,217,033, which amount exceeds by over $200,000,000 the aggregate bonded debt of the railroads failing.

Bradstreet's has somewhat different figures relating to business failures, since its totals include commercial, industrial and financial business failures, in which estimated actual assets are smaller than reported liabilities. Thus they do not include 240 banks, whose aggregate liabilities amounted to about $80,000,000, as contrasted with assets of $100,000,000. In this way the business failures figure up to $402,427,818 for the liabilities, against $262,417,532 assets. The proportion of the latter is greater than ever before, being 65 per cent.

When it is considered how enormous is the shrinkage in values of stock and assets of those concerns which have weathered the storm some faint conception of its destructive effects may be obtained. There were 1,050,000 firms, corporations and individuals in business in 1893, of whom 15,560, or 1.50 per cent., failed. The records of losses cover only that small percentage. How infinitely greater must be the losses of the survivors!

Sense and Nonsense.

BY A. D. F.

Since the days of Solomon men have taken pleasure in proving and likewise in disproving his saying that "There is no new thing under the sun." The lawyers go back to ancient Rome for the maxims of their trade, and now they are unearthing clay tablets from Assyrian ruins with the records of deeds and other legal forms; perhaps some day they will find the quitclaim Adam gave on leaving his beautiful country place. We know they had strikes when the pyramids were building and the old magi of Persia man anticipated our schemes and has quietly kept them at work in her characteristic fashion without asking advice or giving it. Is it not a gratifying thought to the hot air furnaceman, and the maker and setter of hot water heating apparatus to consider that their methods of warming houses have been practiced on a stupendous scale since the creation of the world? The furnace at the equator sends up its column of hot air to the first floor of the heavens, and the mighty trade winds furnish the cold air supply drawn from the tropics of Cancer and Capricorn, and which flows to the equatorial furnace without the aid of any wooden or sheet metal box.

And what is the Gulf Stream but an enormous flow pipe warming the whole of Europe? In the details of her apparatus Nature has not followed modern methods in every particular. She uses a combination heater of her own devising, and which embodies certain curious features. Her hot water system is not an independent apparatus, but relies upon the heating of the air for its operation. The Gulf of Mexico is only a secondary heater; it is the trade wind from the West of Africa that starts the water flowing to the Gulf, where it twists about for a while and then begins its northeast journey across the Atlantic for the benign purpose of keeping Europe from freezing to death. Were it not so, England would be alive with reindeer, Scotland a pasture for Polar bears, and hordes of Eskimo would be chattering on either bank of the Rhine and waging war for the possession of Alsace.

The big heating system for the house of the world is operated from one central fire pot, the sun, and with the wastefulness that Nature is guilty of in all her works there is no use made of conducted or convected heat. Only the radiant heat reaches us through space, to be transferred to air and water through convection from the earth. How contrary to our notions of thrift is this prodigality of warmth, with the sun shining day and night throughout the round of infinite space and this little earth of ours intercepting but the smallest fraction of it, all the rest, so far as our comfort is concerned, wasting itself on the cold sky. But some day Nature will be bankrupt and find that she cannot meet the coal bills of the sun. Then we'll be in a pretty pickle; we'll wake on a fine July morning to a November sun, August will bring with it winter weather, before the fall is half done we'll have burnt up all our coal, and by Thanksgiving we'll be crawling down volcano craters to huddle around the subterranean fires. The next spring this earth will be as dead and frozen as the moon, and astronomers on the planet Mars will be aiming their telescopes this way and wondering if the Washington Monument is only an icicle or the Ferris Wheel a part of an incompleted bicycle.

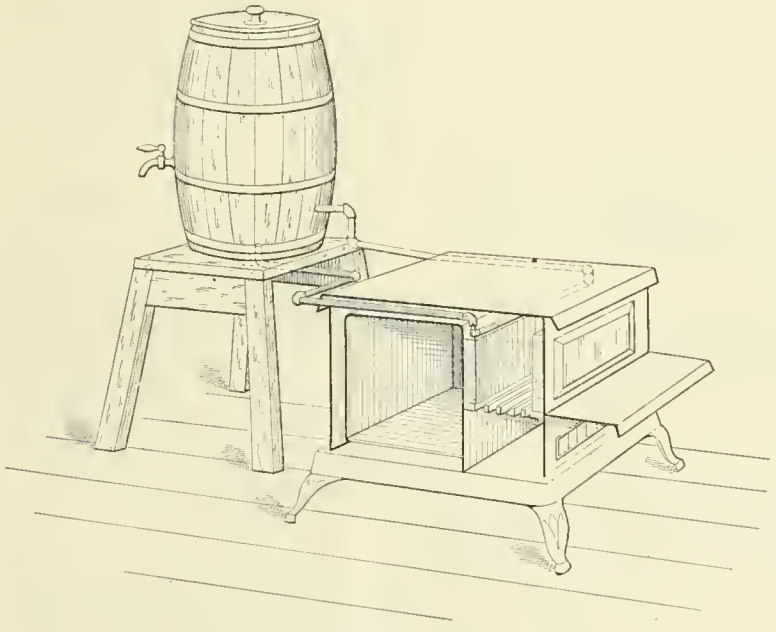
But there is no use in worrying over what may happen next summer, or any other summer for that matter. The bank account of Nature is still good, so far as we know, leastwise she hasn't stopped shoveling fuel into the sun, so the trade winds will keep on blowing, the Gulf Stream will continue to thaw England into verdure, and steam and hot water, furnaces and stoves, open grates and Baltimore heaters will give warmth and occupation for many years to come.

THE LETTER BOX.

A Plan for Heating Water.

From J. S., *Vincentown, N. J.*—I have a customer who wants plenty of hot water for dish washing at a country hotel, and does not want to interfere with the cooking. There is no water supply except from a pump, and his stove is an old fashioned flat top cook. He does not want to spend money for a new stove, a tank and a force pump, but thinks that a Yankee ought to be able to meet his case. So I make application to *The Metal Worker* for assistance.

Answer.—A supply of hot water that has been found satisfactory in similar cases has been obtained by the following plan, as shown by the cut: A pipe connected with the pipes in the stove, being careful to have a slight descent from the bottom of the barrel to the fire chamber, and a slight ascent from the fire chamber back to the side of the barrel. The more direct connection should be made to the side of the barrel. A faucet should be placed about 10 inches above the bottom of the barrel so that there will be no possibility of the barrel becoming empty. The barrel can be filled by a bucket nearly to the top, leaving some space for the water to expand as it is heated. A wooden cover should be made for the barrel. If steam is made



A Plan for Heating Water.

water back is made for the stove, special ells being used for the purpose. One pipe enters from the back of the stove, just above the top of the oven, and runs across it to the first chamber, with a drop ell. Then along the fire chamber to another ell and from it across the oven on the other side and out of the stove. If the special drop ells cannot be secured readily, two more ells should be used to drop the pipe that runs across the fire chamber so that it will not choke the draft. The fire bricks should be cut down in hight, to let the pipe back so that it will not take up fire space. A stand should be made to support a good oak barrel a few inches above the top of the stove. From the bottom of the barrel a pipe should be taken that has been connected by asbestos washers, red lead and jam nuts. About 6 inches above the bottom of the barrel another pipe should be taken from the side. These two pipes should now be in the kitchen a pipe can be run from the side of the barrel, near the top, to the chimney to carry the steam off.

Green Water from Copper Tank.

From H. M. K., *Cortland, N. Y.*—Referring to letter from "J. H. S.," Richmond, Maine, in *The Metal Worker*, December 23, about the water in copper tank turning green, I want to give a little of my experience. I made a new copper tank for a range, and in a few days I was asked to send my workmen there to see what was the matter with the cistern water, they complaining that the water turned green as soon as soap was used in it. My man went and looked at roof, conductors, &c., and examined cistern. The water was clear and good; went to the range, lifted the cover to reservoir, took out a dipperful of water, poured into wash basin, took a piece of soap and tried it; result, water turned green at once. Took a dipperful of cistern water, cold, and tried it and it remained clear. The trouble, then, must be in the tank. Could not account for it. After a careful examination I became satisfied that the coal gases reached the water where the wire in top of reservoir was sprung away from the casing. I bent back the wire around the top to its place and filled the crack around the top with stove putty, and solved the problem and had no more trouble. Had never heard of such a case in my life. And so we hardwaremen and tinkers learn something new every day.

Good Wiping Solder.

From E. E. H., *St. Louis.*—I would like *The Metal Worker* to settle a difference of opinion by giving the materials and proportions used in making good wiping solder for plumbers. Is anything used besides tin and lead?

Answer.—Good wiping solder as universally used is composed of tin and lead only. A solder that has been much used is composed of 2 parts lead and 1 part tin, but a better solder and one that makes brighter joints is made of 60 parts lead and 40 parts tin. In actual use the proportion varies with the plumber, some using more and some less tin. The more tin that is used the quicker the work must be done and the better the joint that is made.

Pressure Supply and Piping to Boiler.

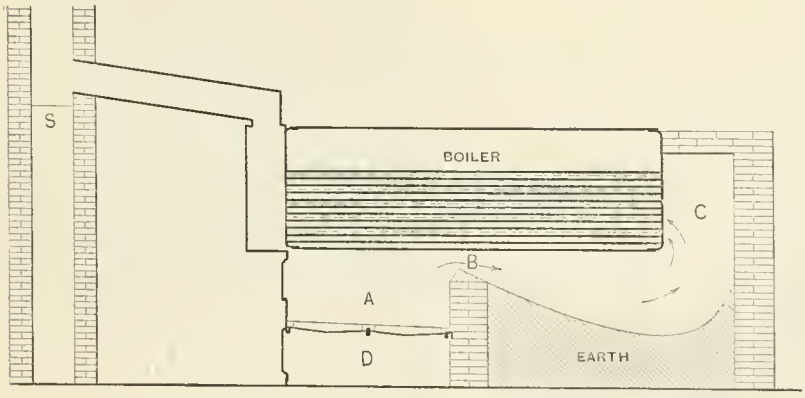
From J. M. S., *Hinsdale, N. Y.*—I have a range boiler to set and would like *The Metal Worker* to answer the following questions and give the reason for them: Water is to be supplied to the boiler from a tank over the kitchen, and hot and cold water are to be supplied to a bathtub and wash basin and for use in the kitchen. I will have to run a pipe from tank to boiler. Would it be best to run this supply down into the cellar and tap it there to supply the tub and basin and then continue it up to boiler, or should I put in a separate pipe from the tank to supply them with water? Would there be sufficient pressure to keep the boiler full and supply the other fixtures with water if only one pipe is taken from the tank? Is it necessary to extend either the cold water inlet or the hot water discharge down into the boiler, and how far for each? The boiler is to be heated by a water back in a range, and ¾-inch pipe is to be used throughout. Is this correct for the different pipes?

Answer.—It is not necessary to have a separate pipe to supply the boiler with cold water, and a branch from the pipe that supplies the other fixtures will answer every requirement. Just as long as there is water in a tank placed above a boiler the water will run down into the boiler, though when a cock is opened on the same pipe the pressure will be slightly reduced, but not enough to cause trouble. The cold water pipe should extend down by means of a tube into the boiler to within 6 inches of the bot-

tom, and the tube should have a hole in it ⅛ inch in diameter at the top to prevent siphonage. This tube delivers the water to the boiler without permitting it to mingle with and cool the hot water at the top. The hot water discharge should not extend down into the boiler, because the hottest water is at the top and should be allowed to escape at once. There will be no trouble from the use of ¾-inch pipe, though ⅝-inch is more generally used for economy both of water and material, as it supplies water fast enough to be satisfactory for household use.

Remedy Wanted for Poor Draft.

From A. W., *Geneseo, Ill.*—If "E. O. H." of Rock Valley, Iowa, whose inquiry appeared in *The Metal Worker*, December 16, will carry out the following suggestions I am sure he will have a good draft to his boiler, provided his chimney flues are entirely independent of each other and are fully as large at the top as at bottom and full size all the way up, and that he uses only one of the flues in the chimney. When both flues are used for one fire the tendency is to work like an inverted syphon, and the air comes down one flue and up the other and spoils the draft from the boiler or fire. See that the area of the flue at the bridge wall at B, in the accompanying sketch, is less than the area of the chimney flue. Then increase the area gradually until the space at the rear of the boiler is fully twice the capacity of the chimney flue, so as to make an easy turn into the boiler flues at C. Connect the smoke pipe to only one of the chimney flues; and it is a good plan to stop off this flue directly under where the smoke pipe enters it, to prevent the damp air from the ground interfering with the draft. This can be done by a sheet iron slide at S, and it can be drawn out occasionally to clear the flue above. See that there are no air leaks, either about the boiler or base of chimney into the flues.



Remedy Wanted for Poor Draft.

What Caused the Explosion.

From C. I. L., *New Jersey.*—Please inform me what caused the explosion which I describe. When a summer residence here was closed, all the water was drawn out of the pipes and the water shut off to prevent freezing. Recently a servant was sent to prepare for a short visit by the family, and built a fire in the range, and later on when some water was needed it was turned on by opening a stop cock in the front cellar, but before the servant reached the kitchen a terrific explosion occurred. The water back was thrown out through a window 50 feet across a garden, the brick jamb at one side of the range was torn away, the range was demolished, the ceiling was shattered, the windows were broken, and coals were thrown all about the kitchen. A fire was prevented by the broken pipes sending water in every direction. I was called in to make the repairs, and would like to know what made the trouble.

Answer.—The explosion was caused by water entering a water back that was possibly red hot, when steam was instantly made of such great expansive power that it not only burst the water back but spread everything that tended to confine it. To use a fire against a water back that has no water in it is likely to crack the water back through expansion or melt the solder on the pipe connections, or make leaky joints when iron pipe is used. To turn the water into a water back lying in a good hot fire is always extremely dangerous, and some severe personal injuries and wreck of property have resulted from doing it.

Wants the Plumbers' Opinion.

From B. & S., *Greenville, S. C.*—We are in a controversy with another plumber, also our plumbing inspector, as to the advisability of putting in a running trap and fresh air vent in the house drain leading to the public sewer. We have always used a running trap and air vent in all of our work. We also see in all city plumbing rules this trap mentioned.

We have a sanitary sewer only, with plenty of fall and automatic flushing tanks at the head of each sewer. Manholes are also placed at the intersection of streets, with perforated covers for ventilation. The sewers are made of regular sewer pipe from 8 to 20 inches. In connecting with this sewer is it advisable to use a running trap and air vent? Would like to hear from the trade on the subject.

Boston Plumbers' Paste.

From L. W. T., *Rockport, Mass.*—In *The Metal Worker*, December 23, I saw an inquiry for Boston plumbers' paste. The paste is made as follows: Take flour and cold water and mix quite thin and beat all the lumps out; sprinkle in a little pulverized alum, which will preserve the paste a month or so; thicken over a fire, but not too quick. In using the paste for a round joint after the ends of the pipe are shaved and greased, cut a strip of paper an inch wide and fasten to the pipe with the paste. On a branch joint the branch is treated the same way, but the main pipe is not papered; the paste alone is rubbed in; then the pipe is shaved and greased. After the joint is wiped a damp cloth will remove the paste from the pipe not papered. By cutting across the paper that is put on, with a knife, it can be readily removed if the pipe has been greased under it. If "W. F. S." tries this I would like to hear from him through *The Metal Worker* how he likes it. Those who apply to the "Letter Box" for assistance should report their success with the remedies suggested and given.

From DAVID SMITH, *Boston.*—The paste about which "W. F. S." inquires in *The Metal Worker*, December 23, is called Noah's paste, and is made by the Boston Paste Company, 46 Beverly street, Boston, Mass. It is used by many plumbers all through this section just the same as soil with general satisfaction.

From X. Y., *Bridgeport, Conn.*—Answering the inquiry of "W. F. S.," Bayfield, Wis., which appeared in *The Metal Worker* of December 23, would say that if he will use common, ordinary, every day flour paste, such as used by paper hangers, he will have no trouble.

Location of Air Supply.

From J. W. S., *Paterson, N. J.*—I see in *The Metal Worker*, December 30, that "W." of Warsaw, N. Y., cuts "Snips," whose letter appeared December 2, short by telling that if he will figure the capacity of a 10 x 14 register, less the grating, he will find that it has no more capacity than a 10-inch pipe. Now, I think that if "W." will figure the register and pipe correctly he will find that the 10 x 14 register has an area of 16 square inches more than the 10-inch pipe.

Pipes From Tank.

From G. F. W., *Grandy Center, Iowa.*—In answer to "M. T. C.," Riverside, Cal., whose inquiry appeared in *The Metal Worker* of December 23, I would suggest that he run his 2-inch overflow pipe into the bottom of the tank and attach an outlet valve to it in the bottom of the tank, and use a float attached to the valve so as to open the valve when the tank gets full. By so doing he gets the same direct pressure on the overflow pipe as he does by opening the stop cock at A. On account of the way he has his overflow it gets air trapped, and having no direct pressure it is easier to flow over the top of the tank than down the overflow pipe and work against the air trap. By letting the water into the overflow pipe at the bottom of the tank no air will get into the overflow pipe, and therefore air trapping will be avoided.

Address Wanted.

From SHIELDS & GREER, *Greensburg, Pa.*—We wish some one would furnish us the name and address of the firm manufacturing a ram or pump for drawing water. The concern we want to get the name of is located, we think, in Pulaski, Va.

Tidings from the Canadian Northwest speak of acute distress among the farmers in that region, where the crops were a partial failure.

PLUMBING and GAS FITTING.

Review of the Plumbing Trade.

THE year 1893, which proved so disastrous in many lines of trade, has not left the plumbing industry untouched. Reports from our correspondents in all parts of the country indicate an almost general falling off in the volume of business done during the year, with an even more than corresponding decrease in the margin of profit, owing to keener competition. This falling off in business was, however, almost wholly confined to the latter half of the year, as the first six months yielded generally fully as much business, if not more, than that of the previous year.

Business in the West.

This fact is more particularly brought out in reports from the Western States, which speak largely of a very favorable opening and a volume of business preponderating materially over that of 1892, until about July 1, when the general wave of financial stringency which swept over the country, by causing the abandonment of building operations, or the postponement of contemplated improvements, brought with it a sensible decrease in plumbing jobs. A report from a correspondent in Salt Lake City, Utah, speaks of the prospects in the early spring as having been favorable for the best season that had been experienced for many years, but the depression above referred to caused a complete cut-off in the volume of business. A similar experience seems to have been common to the trade in general.

Business in the East.

In the East the jobbing trade has been severely struck, and more than one report mentions a diminution of business to the extent of more than one-half, while the competition has proved the severest ever yet experienced. In the smaller and jobbing trade this feature has been intensified by the fact that quite a number of new shops of the smallest description have been started by journeymen out of employment, who, to quote a New England plumbing firm of high reputation:

Take every little repair job that they can get hold of at the closest prices, having thus subdivided the business to such an extent as in some cases to cause almost ruinous competition. These small tradesmen compete against each other on every little contract or repair work, the job eventually being taken by some one at such a price as to entirely preclude any prospect of profit.

Business in the South.

In the South plumbers have fared rather better than their brethren in other parts of the country. The financial stringency not having been so oppressive in that section, the general run of business has not been falling off to anything like the extent that has generally marked its course elsewhere. Southern reports, as a rule, speak of a better volume of trade than that of 1892, although business has been done on a closer margin, and a larger amount of personal exertion was required in working it up. And, even in the South, many contracts in plumbing have been lost in consequence of the abandonment of building operations and the lack of ready cash.

Collections.

Collections have been much more difficult during the latter half of the year and particularly toward the close. This is spoken of as one of the most unfavorable results to the plumbing trade of the general financial depression. Employing plumbers have, in many cases, found it extremely hard to collect their outstanding accounts and to obtain the means of paying their workmen.

Cheaper Goods.

Owing to the hard times, a general disposition has been shown toward the use of cheaper goods where repairs or fittings were absolutely necessary. This indicates merely the fact that such repairs were only intended to be of a temporary character, and would be eventually replaced by more substantial articles. No one has had any money to waste on mere luxuries, and, as a general rule, particularly within the last few months, such plumbing work as has been carried out has been only of an absolutely necessary nature.

The Outlook.

The outlook is more or less shrouded in the mist of uncertainty, and, of course, depends mainly upon the encouragement or otherwise given to investors to put their money into building operations. A great deal of work in this line is pending, and will be undertaken immediately the promoters think that they have any grounds for confidence in the financial situation. Architects are reported to hold quite an accumulation of work ready to be undertaken so soon as the necessary encouragement is afforded. This should mean a good year for the plumbing trade, provided the confidence of the public is restored within a reasonable time. The majority of observers in the trade do not, however, look for any great revival before the spring at the earliest, and possibly, if the discussion of the tariff and other kindred questions is prolonged beyond that time, the stagnation may continue well into the summer. A valued correspondent in the West writing to us makes the following trite observations:

If the people would do less talking about politics and put their shoulders to the wheel of their business, in a short time they would find out that they are not in such bad shape after all.

And this probably contains the truth as to the cause of the greater part of so-called trade depression. The work done by the plumbers during the year is generally spoken of as maintaining that satisfactory improvement which has marked the past few years.

Trade Schools.

The advantages offered by the trade and other training schools, especially those well known establishments in New York, Philadelphia, Brooklyn and other Eastern cities, is being more fully recognized both by employers and employed. Their records for the past year or two show a constantly increasing number of applicants for instruction, and in every case the plumbing classes have proved the greatest attraction. Students in these classes outnumber by far those in any other line of trade. The results of the thorough training received by the graduates of the New York and other trade schools is demonstrated by their success in their several lines of businesses, and in none has this been so marked as in the plumbing trade.

Associations of Master Plumbers.

The National Association of Master Plumbers continue their good work of organizing the trade and bringing the members into closer social and business relationship in the various cities. Several new local associations, under the auspices of the National Association, have been formed in the towns and cities of the Union during the past year. The organization appears to have worked most harmoniously, and is yearly becoming more recognized as a highly successful association. One good feature which has been directly introduced by its meetings is a more friendly rivalry between competing concerns in place of the bitter and cutthroat measures that were formerly too often adopted by rivals in the trade. This has been largely brought about by the social features of the association, which, bringing men together out of business, have given them friendlier feelings toward each other in business.

The use of poor and cheap ma-

erials in contract work is becoming less common, and on every hand a marked improvement is noted in the manner in which the conscientious performance of contracts is carried out. A better quality of material is used every year, and a larger amount of care is bestowed upon the work done.

Plumbers' Supplies.

Despite the prevailing depression of the year, manufacturers of and dealers in sanitary fixtures and plumbers' supplies are able, in a number of instances, to render quite cheerful reports of the aggregate volume of trade in their goods, although the mention of curtailed business toward the close of the year is almost unanimous, and the tale of a declining margin of profits—except in the case of a few patented specialties—may be said to be quite general throughout the trade.

Competition and Profits.

Competition has been becoming sharper every year of late, and the one just closed has proved no exception in this respect. The comparative dearth of orders which obtained in many quarters during the greater part of the year stimulated, indeed, a still keener rivalry among manufacturers. Profits were consequently brought down to the narrowest margin. In some cases the assertion is made that, in order to get cash and business, goods were not only sold at less profit than ever before, but in several instances actually below cost. This was not the case in the early part of the year, when business was moving briskly and giving promise of an excellent trade showing for 1893, until the financial panic broke in rudely upon the rosy views of manufacturers.

The effect of the financial stringency on his business is thus described by a large manufacturer of sanitary goods in the West:

Up to July 1 our business was excellent and displayed an increase over last year of about 30 per cent. Up to that time we were running on full time, 10 hours a day, with a full complement of men. Since then we have been gradually cutting down both the number of days and hours, and for the past two months have been running on less than half time. The aggregate business done for the year has been about 26 per cent. less than that of 1892.

Improvement in Goods.

Although there has not been quite as large a line of absolute novelties in sanitary goods or appliances introduced in the past year, the tendency toward improvement in those goods is quite as marked as in previous years. The quality of plumbing material and fittings all along the line constantly improves, and consumers get much better goods for their money than ever before. In this connection, one of the largest houses in the Eastern trade reports as follows:

The plumbing goods demanded for all classes of buildings tend to an increase in quantity and an improvement in quality. This has been the case for the past few years, and is leading up to a very much improved style of plumbing fixtures.

Meanwhile the practice of more economy in manufacture and somewhat cheaper raw material have combined to enable manufacturers to place their highest class goods on the market so much cheaper as to insure a large increase in the use of them in preference to the cheaper grades.

Failures in the Trade.

The year has been marked by the bringing down of a number of concerns in the plumbers' supply trade, the basis of whose business standing was not sufficiently secure. On the bearing of this question toward the general trade the following remarks made by a member of one of the largest manufacturing concerns in New York State are worthy of consideration:

If we had a severe national bankrupt law, or a severe and better State bankrupt law, we could have weathered the panic in a better manner. Our present law does not protect the honest merchant who pays 100 cents on the dollar, but fosters mushroom concerns which generally fail disgracefully and which during their existence injure the honest and reputable houses. These mushroom concerns not only bring prices down to cost and far below, but run down the quality of goods to a deplorable level. Such firms fail, generally make no settlements, and, although their failures are known to be dishonest, the parties thereto are so well protected by our laws that they frequently start in business again and renew their career of fraud. If we had severe laws these so-called pools, trusts and combinations would not exist to the extent that they do at the present time; but these so-called combinations, &c., are an absolute necessity so long as we cannot have good laws, otherwise many houses would cease to exist. My experience in combinations is that manufacturers generally desire but a remunerative profit, as they realize that excessive profits would but kindle new competition. Many houses knowingly and willfully sell below cost, then fail or settle for a small percentage and go on unpunished. Is this just for the ones who strive to pay 100 cents on the dollar?

An increase in the number of bad debts is a feature in the accounts of several plumbers' supply houses which is loudly complained of.

The experience of a very prominent house in the trade, which is in correspondence with that of others, was that these uncollectable accounts reached 3 per cent. on the sales of 1893, as against ⅓ per cent. in 1892. Another concern in the East writes on the same subject as follows:

The so-called financial stringency had the effect of tying up a large amount of our bills and accounts receivable. How much of this will prove total loss we are not in position to know at this time. The indications are that a large proportion will have to go to profit and loss account. It is our opinion that in nearly all cases in which our customers are financially embarrassed the trouble has been caused by doing too much business with small capital. The profits in our line have been so small in the past two years that liabilities could not be reduced. The financial difficulties also had the effect to show the true standing of many concerns who formerly had good credit, but since forced to make statements of their condition it has been found that too much credit was extended. Therefore very little change for the better can be expected until a more profitable business will be the rule.

In short, those concerns that have, during the past few months, done business on the most cautious and conservative lines, have come out best in their balances at the close of the year.

Prospects for Sanitary Goods.

The outlook for the trade in sanitary goods and plumbers' supplies in the earlier months of 1894 is, by general consent, regarded as very unsatisfactory. In fact it is thought that a still lower point of depression will be reached before the spring, and that no material revival of business can be looked for during the first six months, unless some unforeseen combination of circumstances shall, in the meantime, encourage capital to seek investment in building. Stocks of manufactured goods are unusually low everywhere, and these are not being supplemented to any material extent, as manufacturers generally are unwilling, under present conditions, to put out more goods than are actually salable. Consequently an advance in prices would be more than likely to follow any largely increased demand. Apparently there is a large amount of building contemplated for this year, and although much of this may be abandoned or postponed, the chances are, the tariff and other disturbing questions being settled, that the latter half of the present year may see a wonderful restoration of activity in the trade.

Sanitary Goods in Canada.

The causes which brought about the depression in this country last year have not operated to the same extent over the border, judging from reports received from the Dominion of Canada. Business in sanitary goods is there spoken of as showing an increase for 1893 of from 10 to 40 per cent. on sanitary specialties. Competition, moreover, has not proved excessive, and the margin of profit, though tending to decline, has been of a satisfactory character. The outlook for this year's trade is regarded as bright, and it is hoped that 1894 will lead previous records.

Massachusetts State Association of Master Plumbers.

Secretary Daniel Shannon of the Massachusetts State Association of Master Plumbers is sending the following invitation to the plumbers throughout the State for the annual convention:

"The third regular convention of the Massachusetts State Association of Master Plumbers will be held in Elks' Hall, 24 Hayward place (near Globe Theater), Tuesday, January 9, 1894. Local associations are requested to elect delegates and send a strong representation from their districts. All master plumbers legitimately engaged in the plumbing business in our State are cordially invited to attend and affiliate with us. The Boston association has made ample provision for the comfort and entertainment of a large number, and it is hoped the brethren of the craft will avail themselves of this opportunity to enroll under our banner."

An enjoyable feature of the gathering will be the concert and ball in the evening, which the ladies will attend.

Boston Master Plumbers.

At a regular meeting of the Master Plumbers' Association of Boston and Vicinity, held recently at Boston, the following officers were elected for the year 1894:

J. Warren French, president.
David Smith, first vice-president.
H. H. Collins, second vice-president.
Charles M. Bromwich, third vice-president.
W. A. Tucker, recording secretary.
E. C. Kelly, corresponding secretary.
J. W. Cosden, financial secretary.
Daniel Shannon, treasurer.

AUDITING COMMITTEE.

John Crawford, P. H. Winn, J. O'Connell.

LEGISLATIVE COMMITTEE.

G. C. Forbes, J. F. Davlin, Isaac Riley, T. H. Duggan, T. E. Sharpe.

SANITARY COMMITTEE.

T. J. Tute, F. A. Titus, James Tucker, W. N. McKenna, C. J. Mansfield.

ARBITRATION COMMITTEE.

John Crawford, H. H. Collins, J. W. French, David Smith, J. F. Buerkel.

APPRENTICESHIP COMMITTEE.

Chas. J. Linnehan, I. N. Tucker, W. A. Johnson, James Crawford, J. J. Kelly.

TRAPS AND VENTS.

THE BANQUET held by the New York master plumbers at Jaeger's restaurant on the night of December 23 was a very enjoyable affair. About 200 were present, presided over by Col. George D. Scott, and ample honor was paid to an elaborate *menu*. The feature of the occasion was the presentation of a handsome gold watch chain and locket to President Henry G. Gabay, as a token of the esteem in which he is held by his brother plumbers and an evidence of their appreciation of his labors in their behalf. The presentation was made by John Byrns in a graceful speech, and was received with grateful surprise by the zealous president. Congratulations, toasts, speeches, good wishes and good cheer left nothing wanting to make the event as merry as the season.

AT A REGULAR MEETING of the Pipers,' Plumbers' and Metal Workers' Union of Portland, Maine, recently held, the following officers were elected for the ensuing year: President, D. E. McBride; vice-president, F. McDermott; recording secretary, Gus Smith; financial secretary, James Reagan; treasurer, Thomas McBride; conductor, R. P. Berry; warden, R. P. Merrill; grand deputy, P. A. Mahoney.

AT A RECENT TOWN MEETING in Clinton, Mass., some changes were made in the plumbing laws, the more important being that a plumber must make, free of charge, any changes in work done by him that will not satisfy the inspector, and that the Board of Examiners and not the Board of Health have power to revoke licenses. A provision to fine a plumber $50 for violating the laws was defeated.

THE PLUMBERS of New Jersey are taking steps to present to the Legislature, about to convene, a bill providing an examining board of plumbers.

JOSEPH BACKES, Point Pleasant, N. J., has moved his large plumbing and gas fitting business from the Hendrickson Building to the new Huss Building, where he has more commodious quarters especially arranged for his convenience.

THE GLOVERSVILLE, N. Y., Plumbing Board has elected the following officers: President, H. C. Sowle; secretary, T. F. Mullarkey; treasurer, E. B. Baker. The board has granted plumbers' licenses to the following: H. C. and J. E. Sowle, Mullarkey & Senior, Haggart & Treadway, Wm. H. Demarest, Treher & Knott, William Huggett and C. P. Buschmann.

E. E. HAY now carries on the plumbing business at 2110 Clark street, St. Louis, Mo., formerly run by the firm of Hay & Leary, who have dissolved partnership.

THE MASTER PLUMBERS of Boston and vicinity have selected to fill one of their offices T. J. Tute, ex-treasurer of the National Association of Master Plumbers.

A NOTICE IS ISSUED to the trade under date of January 1 that the Smith & Winchester Company, 19-37 Wendell street, Boston, Mass., have purchased the stock, machinery, good will, &c., of the business formerly conducted by Smith & Winchester and will greatly increase their facilities. It is their intention to carry a full and complete line of goods in the steam, gas, water and plumbing trades. The company will be under the same management as their predecessors.

SECRETARY DAVID SMITH of the National Association of Master Plumbers has been elected one of the officials of the master plumbers of Boston and vicinity for the ensuing year.

A CALENDAR POSTER of exceptional size is sent out by F. E. Myers & Brothers of Ashland, Ohio. It is 4 feet or more in length and a couple of feet wide, showing at the top a general view of the company's works at Ashland, a reproduction of the World's Columbian Exposition award, and then follow prints of a very large number of pumps of all sorts which the company make. The lower part of the sheet carries similar illustrations of hay tools. The calendar is in 12 sheets, fastened to the middle of the poster. Accompanying the calendar is a very pretty circular note addressed to the trade, calling attention to their goods.

JOSEPH COOPER has leased the basement of the Post Office Building at Pontiac, Mich., and will occupy the premises with his stock of plumbing goods and workshop.

JAMES E. SMITH, plumber and gas fitter, has retired from business at Gloucester, N. J., and given the control of his extensive trade to his two sons, James and John.

F. C. BOOTH, a Bridgeport, Conn., plumber, was seriously burned about the face by the explosion of a lamp recently.

THE ABEL-GERHARD PLUMBING COMPANY were recently incorporated at St. Louis, Mo., with a capital stock of $25,000, all paid. Frederick Abel holds 124 shares, Oscar J. Gerhard 124, and Walter C. Abel two shares.

YARRINGTON & MCCABE have leased a store in Lewis' Block, at Birmingham, Conn., and have started in the plumbing business.

A LOCAL UNION of plumbers, gas and steam fitters was recently organized at Manchester, N. H., after which a banquet was served. Daniel O'Connell and Garrett Cotter were elected president and secretary.

SMITH & WINCHESTER COMPANY, Boston, Mass., issue advance extract pages from their 1894 complete catalogue of plumbing, steam, gas and water supplies. The few pages at hand show several interesting articles in the plumbing line. The first is Moore's patent Primrose basin combination; then come laundry tubs, kitchen sinks of various sorts in porcelain, pantry sinks, slop hoppers, &c. The Charlesgate syphon closet is noticed, likewise lavatories and other specialties.

A. Y. MCDONALD & CO., 168 Lake street, Chicago, manufacturers of and dealers in plumbers' supplies, sanitary specialties, pumps, steam and brass goods, have issued a fine wall calendar for 1894. The main feature of this calendar is a beautiful picture, lithographed in colors, artistic in conception and unusually well executed. Attached to the lower part of the picture are leaflets for each monht. The company's card is modest and inconspicuous.

J. S. TRIMBLE, the senior partner of the firm of Trimble & Lutz of Wheeling, W. Va., and an uncle of E. D. Hornbrook of Kansas City, Mo., died at his home in Wheeling, W. Va., December 23, 1893, in his sixty-third year. The business of which he was a partner is a leading plumbing, steam heating and mill supply house in the State, and will be continued in the old name and under the management of Geo. W. Lutz, the junior member of the firm.

Treatment of Lamps.

The Philadelphia *Times* gives the following practical directions for the maintenance and care of lamps, so as to obtain from them their maximum efficiency: Lamp wicks should have the charred part rubbed off with a rag kept for that purpose. They should very seldom be cut. They should not be used so long that the webbing becomes tight and non porous.

Lamps should be kept filled with oil. It is bad for the wick and burner when the oil left over from one evening's reading is made to do duty a second time.

The tank should be filled again.

About once a month the wick should be removed, the burners unscrewed and boiled in a little water in which common washing soda has been dissolved. This will remove the almost imperceptible coating of dust and grease that forms on the brass.

The lamp chimney should be washed in warm, soapy water each day, a mop made especially for such work being used. When dried it should be polished with soft newspaper or chamois.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until January 23 for the interior finish, plumbing, gas piping and approaches for the United States Post Office Building at Lewiston, Maine. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the superintendent at Lewiston.

The Pennsylvania Sewer Pipe Works, Huntingdon, Pa., closed down on Saturday last for 30 days in order to carry out some extenaions, with the view of increasing the capacity of the works.

Railroad interests seem to have been peculiarly hard hit by last year's financial disorders. The tale of railroad troubles for 1893 shows more receiverships than during the previous ten years, while their individual importance was even more remarkable.

Sheet Metals and Sheet Metal Machinery.

Manufacturers of sheet metals and sheet metal goods, with one consent, testify to a year of contracted business and dwindling profits. This has been particularly emphasized in the sheet iron trade, where competition has been of the fiercest character. So much has this been the case that one of the largest sheet iron and steel manufacturers in the Eastern States reports that many mills have been willing to take orders at any price in order to tide over the depression, with the natural consequence that some have gone into receivers' hands, thus becoming still sharper competitors.

Sheet Iron and Steel.

Prices of black iron have been utterly demoralized, and practically whatever consumers might choose to offer. For the last few months of the year producers were generally constrained to restrict their output very materially on account of accumulating stocks which could not be disposed of at the hand to mouth system of buying lately in vogue. Galvanized sheet iron has not fared as badly as black, the demand having continued fair throughout the year and the production limited. In general trade was satisfactory up to the fatal first of July, being in some cases described as equal to that of 1892 and in others as exceeding it. With the advent of the panic, however, the demand for sheet iron fell of anywhere from 20 to 50 per cent. and continued at a low ebb to the end of the year.

Profits on Sheet Iron.

Profits are spoken of as being of an infinitesimal nature where the balance has not, indeed, come out on the wrong side. The prospects for the earlier part of this year are generally regarded as bad, with complete uncertainty as to future developments. As in many other trades, the future course of the sheet iron trade will hinge entirely on the settlement of the tariff question. Owing to the monetary stringency contemplated improvements in rolling mills were, in most instances, deferred or abandoned, and the more recent agitation attending the tariff discussion has served to discourage any particular enterprise among rolling mill proprietors.

Black Sheets for Tinning.

The development of the domestic tin plate industry has created a rapidly increasing demand for black sheets for tinning purposes, which has been, perhaps, the most satisfactory feature in the year's sheet iron trade. Rolling mill proprietors have in some instances introduced the mills into their plants, and this movement is apt to grow to large proportions as the American tin plate manufacture increases in importance.

Sheet Brass and Copper.

Brass and copper rolling mills were busy in the first half of the past year, but experienced a falling off in business after July 1, variously estimated at from 6½ to 50 per cent. Competition is not quite so severe in these materials as in most other lines of goods, consequently the margin of profit on sales has not in general been excessively reduced. Some Western manufacturers, nevertheless, complain that it is increasing, and that it appears likely to grow in severity rather than to abate. The proposed tariff will not have much direct effect on the manufacture of sheet copper and brass, but its discussion, by fostering the general business depression, has sensibly affected the trade in restricting sales and discouraging building operations. The use of sheet copper in architectural work grows yearly, and a notable increase in sales of cornice copper is referred to by more than one of our correspondents.

Sheet Metal Machinery.

Manufacturers of sheet metal machinery, tinners' tools, &c., have shared in the general depression which has affected their sales of staple goods unfavorably. In some cases, however, where special tools or appliances are made, concerns are able to report a satisfactory volume of business. This has been the experience of a New York State firm who are large makers of heavy metal working machine tools, and who report as follows:

In some of our lines the volume is considerably greater than in previous years, due to a steadily increasing trade. In some other lines which we sell to consumers more readily affected by the business depression, the sales have been lighter. The margin of profit has been, generally speaking, a trifle less. We have brought out a number of improved designs of our machinery, and feel that every enterprising house should take advantage of the comparatively dull season to bring forth improvements and new products. There is no better time likewise to improve one's own facilities for manufacturing by the addition of new tools, machinery, &c. While in 1892 a large amount of new machinery was purchased for new additions to works, these purchases have continued during the present year from time to time as it appeared to our interest to rearrange and facilitate work in the different departments.

Several other correspondents speak of having made improvements in appliances during the year or of being at work on new labor saving machinery, and this fact speaks for itself as to the health of the trade.

Tinners' Tools.

A prominent concern in New York State, who are among the leading manufacturers of tinners' tools and implements, favor us with the following observations in regard to their business, which adequately picture the condition of the trade in general:

The volume of business compares unfavorably with other years. The month of July and the month of November have been the worst, or next to the worst, of the months respectively in 30 years, surpassing in that respect the worst months which succeeded the panic of 1873. Competition keeps on growing, and it is a kind of competition approximating closely to the kind the tinware business went through about 15 years ago—that is to say, it seems to be the endeavor on the part of some manufacturers in parts of our line to cheapen goods at the expense of quality. The margin of profit has a tendency to diminish along with the constant diminution of the selling price of goods, and the only possible way for the manufacturer, in our opinion, to arrest this tendency, as far as it affects the manufacturer, is to introduce labor saving machinery, which reduces to some extent the cost of manufacture.

Another correspondent in the trade sends us the following remarks embodying his opinion in regard to the supercession of American born labor by that of the foreign element which is now overcrowding the trades:

Among those who do not dabble in politics there is occasionally one who is sincerely anxious for reforms; and while one may feel at times like crying out against the existing state of things, yet he knows that only the echo will come back, as if spoken against the surrounding walls. The particular thing that I have in mind is the law relating to citizenship. We all know something of the ignorant masses who are flocking to our shores; and yet in the face of all this ignorance, to say nothing of the vicious habits of the ordinary immigrant, they soon have a hand in molding the future of our nation and laws through the ballot box. These persons may be able neither to read nor write, yet this blood bought privilege of freedom is handed out to them as a thing of little or no value. And now the question comes so forcibly and vividly: How about our boys, who, perchance, could read and write at the age of seven years? They are good and loyal citizens, and at an early age are made acquainted with the principles of our free system of government. Yet they must be restrained and withheld from the exercise of their preferences against the invasion of their rights by this incoming tide of immigration—kept back until the age of 21? Would it not be a godsend to us as a nation if equality, at least, might be accorded to those of our own household, along with the adventurer from a foreign shore? If these people were held back, at least until they could read and write, would it not in itself prove a stimulant leading upward and out of absolute ignorance? And then one might contemplate the ever growing competition between the different political parties, in the establishment of free schools for instruction in this very essential line of education. Indeed, what a system of free education it might become!

Canada is able to show a foreign trade for 1893 which is the largest in the history of the Dominion—namely, $247,694,000, as compared with $241,369,000 in 1892—the next largest on record.

ROOFING AND CORNICE.

Roofing and Cornice Trade.

WE have been favored with many reports from members of the roofing and cornice trade located in all parts of the United States, and among the several expressions of opinion it is natural to find a wide variety. In fact, from the reports of certain individuals one would think that the year had been one of remarkable prosperity, and that the coming year was full of hope. Single examples from the East and West and South relate to an increase in business of 50 per cent. These, however, are the exceptions, and it must be recorded that the general state of the roofing and cornice industry is much the same as it is with other industries.

State of the Trade.

While we mention the opinions of a few favored concerns, the bulk of reports all speak of a decrease, the average figure being about 30 per cent. as compared with the preceding year. It is notable, however, that up to July 1 the trade in this line was excellent and much ahead of previous years. At that time the financial stringency came and cut down business by rapid strokes. It was it that brought on the depression of the middle of the summer and turned a profitable year into an unprofitable one. The roofing industry depends primarily, of course, on the building trades, and the monetary difficulties interfered with it very much.

A Chicago correspondent, in speaking of the coming year, expresses himself as follows:

We consider the prospect in the building business to be anything but encouraging; and while there is no doubt that building can be done cheaper in 1894 than during any previous year, there seems to be very little figuring in architects' offices. The residence portion of the city shows a surplus over the demand, and we know of but few contemplated improvements in the business portion. During the year past the financial stringency has, in many cases, induced owners to have work repaired where, in ordinary times, an old roof would be thoroughly overhauled or renewed.

In a general way the prospects for the coming year are uncertain, and many of our correspondents frankly admit that it is impossible to tell what 1894 will bring forth.

The Tariff Discussion.

The opinions respecting the effect of the proposed tariff legislation are divided, though very many of our correspondents express the belief that general prosperity will be interfered with by the reduction in duties, and that indirectly, therefore, the building interests will be affected. It is generally conceded that tin plates will be reduced in price, which would be ordinarily to the advantage of the roofers and cornicemen, but that the unsettlement of general business would more than offset this advantage.

Opinions From the Trade.

The majority of favorable reports come from the East, the West being particularly unfortunate in the volume of business compared with previous years. The tenor of the many letters we have received is summed up in this humorously pathetic sentence from the communication of a Cincinnati correspondent. After discussing the general situation, he says:

Please accept these statements merely as a personal opinion which the lapse of time will doubtless change. To sum it all up, we don't feel good.

Another Ohio correspondent, referring to the effect of the financial stringency on the business of the year, writes:

This is where all the mischief has been accomplished. Owing to the masterly inactivity of the present Congress our industries have been idle during the past season. We are in one of the iron centers, and owing to tariff tinkering all such manufactures are simply paralyzed, which, of course, has a serious influence in this section of the country.

A correspondent in Kentucky, treating of the general situation, sends us the following wise comment:

The political press has so disarranged the otherwise good judgment of our good American people as to render them too susceptible to all sorts of fits on short notice. The very fact that we have been liberal in contracting obligations during the past 20 years, and our ability as a nation to meet them now having been changed by ourselves, should, in our opinion, induce us to shut or put up with less music. If the large number of public educators (newspaper editors) were made to swallow articles paid for, and if we had business men at Washington to do our business in place of lawyers, we have an idea that matters would go on finely.

Magnitude of the Industry.

An Eastern correspondent sends us the following bearing on the industrial situation and the importance of the roofing and cornice industry:

That the manufacture of metal building material is growing is proved by the extensive plants that have sprung into existence the last few years, and the constantly increased capacity of rolling mills. Mills which a few years ago did not consider this branch of the business worth looking after are now deriving their entire income from it, and are running night and day to supply the demand for sheets for building purposes. We are one of the pioneer firms in this line of business, and can say that its growth was something remarkable, both in capital invested and output. Twenty-five years ago there were but three firms in this business, with about $10,000 invested, and now there are hundreds with millions of dollars invested, and the number of men employed, directly and indirectly, runs into the thousands. It is only quite recently that men of capital realized that this industry is an important one and still growing, and the prospects are that the next few years will see it taking greater strides than ever.

A Southern Report.

Turning to the situation in the extreme South, it is pleasant to read such a favorable report from Florida, though it is possible that the writer may, through local pride, take a rather too sanguine view of the situation.

We have passed through a severe year, but very few failures are the result. Though our people, as a rule, are not burdened with an overplus of money, debts are being paid, and we are economizing as a class, while the laborers, as a rule, are all employed. There are many mechanics from the North and West coming here for the winter, and in many cases they are not successful in getting employment, as our people at large fully believe that any work to be done should be awarded to those who are with us all the year. The general feeling throughout the State is one of buoyancy, and we look toward the coming year with bright anticipations, with the feeling that the worst of the storm is over. Money is easier and is flowing into the channels of trade. Many of the towns are waking up to the fact that if they do not fall in with the march of progress they will be relegated to the background, and as a consequence many public improvements are contemplated.

Machinery Makers.

Those concerns who are engaged in the manufacture of machinery for the use of the roofing and cornice trades send in variable reports concerning the business during the past year. Some have recorded an increase and others a decrease, and their opinions similarly are divided in respect to the prospect for 1894. All of them naturally have suffered from the stringency due to the silver trouble during the summer, and the tariff agitation has likewise had its unsettling effect, but the actual result that would follow the enactment of the Wilson bill is variously interpreted. Most of the writers, however, believe that it would injure business and would

therefore indirectly harm the trade in machinery.

In a thoughtful letter we have received from a prominent manufacturer of roofing machinery are the following remarks on the disastrous effect due to the agitation of tariff matters:

While I am aware of the tendency to attribute the stringency in money and lack of business to whatever may appear on the surface, it does seem on mature reflection that the periodical agitation and the carrying out of extreme measures relating to the tariff lead directly to a lack of confidence, and a consequent adverse condition of things. On the strength of high tariff there are based certain plans upon which may depend everything to the founders of such enterprises, and extreme measures either way in relation to this question may cause uncertainty. An example is the case of tin plates, the price of which was so increased by the enactment of the McKinley bill that there was a sudden falling off in the use of terne plate for roofing purposes, and all enterprises, upon which this would have a bearing suffered therefrom. And now a radical change is to be made in the opposite direction, the result of which may be conjectured. The question naturally asserts itself, Are such radical and extreme measures likely to result in the best good to all concerned?

National Iron Roofing Association.

The regular annual meeting of the National Iron Roofing Association will be held in St. Louis January 11 and 12. Quarters have been secured at the Southern Hotel, where all delegates will report. The principal business of the meeting will be the adoption of the new gauge established by Congress in March, 1893, and the weights, price-lists and discounts as based upon that gauge. The St. Louis committee, consisting of the American Roofing Company, St. Louis Corrugating Company, and E. E. Souther & Bro., have made the necessary arrangements for the entertainment of the delegates. A banquet will be tendered the delegates at the Mercantile Club, on Thursday evening, the 11th inst., and unless the weather interferes a carriage drive will be given the delegates on Friday the 12th. A full attendance is anticipated, and, as there are many matters of interest to be brought before the meeting, it is to be hoped that none will neglect to be there. We print below a full list of the houses comprising the association:

Ætna-Standard Iron & Steel Company, Bridgeport, Ohio.
American Roofing Company, St. Louis and Cincinnati.
Beager Mfg. Company, Canton, Ohio.
Cambridge Roofing Company, Cambridge, Ohio.
M. H. Crittenden & Son, Minneapolis, Minn.
Canton Steel Roofing Company, Canton, Ohio.
Cincinnati Corrugating Company, Piqua, Ohio.
Chas. H. Conner, Louisville, Ky.
J. H. Eller & Co., Canton, Ohio.
Garry Iron & Steel Roofing Company, Cleveland, Ohio.
Globe Iron Roofing & Corrugating Company, Cincinnati, Ohio.
W. G. Hyndman & Co., Cincinnati, Ohio.
Kanneberg Roofing Company, Canton, Ohio.
W. A. List & Co., Wheeling, W. Va.
James A. Miller & Bro., Chicago, Ill.
Porter Iron Roofing & Corrugating Company, Cincinnati, Ohio.
E. E. Souther & Bro., St. Louis, Mo.
St. Louis Corrugating Company, St. Louis, Mo.
Wheeling Corrugating Company, Wheeling, W. Va.

FLASHINGS.

A. Northrop & Co., Pittsburgh, Pa., issue an attractive illustrated catalogue relating to their patent paneled sheet metal ceilings and walls. The volume begins with illustrations showing simple ceiling panels, then sectional cuts showing the method of application, also outline drawings of cornices and moldings. Then come more elaborate designs of pauels, followed by examples of ceilings that have been put in place in various buildings. A centerpiece shows the interior of an opera house at St. Johnsbury, Vt., 65 x 100 feet in size, entirely finished by Messrs. Northrop & Co. The remainder of the catalogue contains various examples of ceilings, all being half-tone engravings that show very accurately the appearance of the sheet metal work. At the close of the pamphlet are several pages of references from all parts of the United States.

In spite of the severe business depression existing last year, the business of the Central Expanded Metal Company, Pittsburgh, Pa., manufacturers of expanded metal lathing and fencing, was considerably larger during 1893 than for the preceding year. In Eastern cities the demand for expanded metal lathing has been particularly heavy and bids fair to be larger this year than last. In the West the demand is also showing gains, and the outlook in general for the year upon which we have just entered is exceedingly promising.

E. A. Balm assumes the management of the Illinois Roofing & Supply Company, 203 Lake street, Chicago.

The American Roofing Company, St. Louis, Mo., and Cincinnati, Ohio, report a prosperous year in both of their factories, notwithstanding the troublous times experienced during the past 12 months. The silver producing States were perhaps more affected than any other portion of the country, and as the American Roofing Company ship largely into these States it looked rather uncertain at one time whether their business would equal that of 1892. They are glad to announce, however, that their expectations have been more than realized, and they open up the new year confident that it holds good things in store for them. They have recently contracted for new machinery for both of their plants, which will shortly be placed in position.

The American Radiator Company, 111 Lake street, Chicago, have recently received orders for radiators for the Stock Exchange and Champlain Buildings, Chicago; St. Nicholas Building, St. Louis, and numerous others equally important.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

H. W. Cutler, Tyrone, Pa., plumber, has been awarded the contract for furnishing and placing the Ludlow Valve Company hydrants in the new district, the Sixth and Seventh Wards.

The contract for the steam heating plant in the new town house at Antrim, N. H., has been awarded to Randall & Co. of Concord, N. H., and it is said an even $1000 will be paid for the job.

Hart & Crouse, 211 Water street, New York City, report the following recent sales of Royal steam and hot water heaters in residences only: A. L. Bailey, St. Johnsbury, Vt.; Mrs. C. K. Hetzel, Bay Side, L. I.; J. S. Perine, 128 Vroom street, Jersey City, N. J; Geo. W. Rockerfellow, Plainfield, N. J.; Geo. E. Berna, 632 West 145th street, New York City; Dr. C. A. Wilson, Dubois, Pa.; Mrs. Emma Darling, Plainfield, N. J.; W. Potter, Mount Pleasant, N. J.; S. S. Whittelsey, Plattsburg, N. Y.; A. M. Brown, Keyport, N. J.

The March-Brownback Stove Company of Pottstown, Pa., have just installed a hot water heating plant in the residence of Rev. D. K. Humbert, Bowers, Va. Their No. 20 Crown hot water boiler is used in this plant and it is serving satisfactorily; 705 square feet of radiating surface besides supply and return pipes. This is claimed to be powerful work for a small sized boiler.

The School Board of La Salle, Ont., awarded the contract for supplying a boiler to W. Powers for $300, and the contract for installing the heating plant to A. Landry for $1533.

Sealed proposals will be received by the Board of New City Hall Commissioners, at San Francisco, Cal., up to January 27 for two new 75 horse-power boilers to be set complete. Bids must include the removing of four old boilers. Bids must be made upon blanks that will be furnished by Secretary J. J. McCarthy.

Spearing & Co., Guilford, Maine, are engaged in installing a steam heating plant in the new school house at Milo.

M. A. G. Miller, Lancaster, Ohio, recently received the contract for putting in steam heating fittings and plumbing fixtures in the court house, jail and sheriff's residence, at McArthur, Ohio.

A. A. Sanborn bid $1934 and secured the contract for the heating plant for a new school house to be built at Somerville, Mass.

Among the contracts for steam heating recently taken by the Illinois Heating Company, 88 Lake street, Chicago, can be mentioned the following: Residence of J. C. Jones, Grand boulevard and Forty-second street; apartment building of R. A. Grifenhagen, residence of B. F. Sweet, Western Springs Ill.; residence of F. Swannell, Kankakee, Ill.; two residences of Hecox estate, Austin, Ill.

The work of putting in a heating apparatus at St. Mary's Home, at New Bedford, Mass., is being done by Daniel W. Wilson, who has the contract to heat the structure with hot water.

STEAM AND HOT WATER.

Steam and Hot Water Heating Trade.

CONSIDERING the fact that house heating by steam and hot water is, we may say, a modern system, and more expensive than the older forms of heating by furnaces and stoves, it might be expected that in times of financial difficulty such as the past year the business would suffer very materially. Such, however, does not seem to be the case, or rather, while there has been a great deal of complaint in the steam and hot water heating trade, it is not notably more than in other lines of business. In fact some of our correspondents, inform us of an increased trade. The most complaint is heard from the West, the general feeling there being not over sanguine. In the Eastern States the condition as reported is more satisfactory. Profits, as might have been expected, are lower than they have been.

New Forms of Boilers.

It is noticeable that the patterns of boilers for steam and hot water heating are undergoing less radical changes than in the past. A few years ago, when the system was just coming into popularity, every inventor had some particular notion concerning the design of heating boilers, which was to supersede all former constructions. This search after new forms, regardless too often of efficiency, has largely ceased, and the makers are content to improve along certain well-established lines. This is a decided benefit, for only by carefully watching apparatus, and little by little remedying the defects, can the best results be reached. Occasionally some radical departure may be taken, but there was in the past altogether too much guess work in the designing of odd and peculiar forms. The trade is constantly improving in the matter of installation, and the public are better served with steam and hot water than they formerly were.

The Financial Stringency.

A very important factor in the past year's trade was the financial stringency, and this influenced the boiler business as it did all other lines. In some cases it actually cut down sales and entailed loss through bad debts, and in others it merely prevented an increase that was looked for. A very prominent heating engineer, who does work over a large area of country, in referring to the effect upon business of the financial trouble, says:

This is a most difficult question to answer. While I have done a good business, there was a prospect of 25 per cent. increase if the whole of projected buildings had been put under contract.

A correspondent in Minnesota speaks so cheerfully of the past year that we deem it expedient to quote a line or two from his letter, if for nothing more than for the moral effect of a few encouraging words:

Business in general has been very good this year. There have been no failures of any kind. Banks all passed through the panic so far all right.

Another firm from the Middle States write:

The prospects in April last were for a better year than any previous year, but owing to the financial stringency many of the contemplated large buildings were abandoned.

The smaller concerns throughout the country were not so immediately affected as those in the larger cities and doing an extensive trade. The complaint, however, comes from them that they are feeling the influence of the stringency long after the real trouble has passed. A firm of contractors commenting upon the influence of the money difficulty say:

A great deal of projected work has been dropped; some in progress stopped owing to it. The World's Fair, however, had its share in this way, that people who had to have repairs or changes made in their heating apparatus, used the money for the fair and let the repairs or changes go until another year.

The Effect of Tariff Agitation.

The steam and hot water heating manufacturers are naturally interested in the prospects of the tariff, though their interests are not so immediately affected as those of many other manufacturers. The influence upon their trade, whatever it may be, will be of an indirect nature, and will result from the effects of a changed tariff on the general business of the country. Whatever may be the opinion of our correspondents concerning the effect upon business of higher or lower duties, they are practically unanimous in condemning the tariff agitation. Their criticisms upon the evils of tariff discussion vary from a temperate statement that the effects are bad to the most violent tirades against the legislators who are responsible for the tinkering. One correspondent, eminent in the trade, writing on the matter, says:

Almost anything is better than uncertainty. Indeed, it is not impossible that a bad tariff persevered in for a long term of years would be less disastrous in its effect than the best tariff that can be devised with the quadrennial doubt hanging over the country as to what each Presidential election will bring forth, with possible changes each time in protective rates. . . . We believe that any system of tariff legislation that would insure a fixture of satisfactory customs rates for a longer term—say not less than ten years—would have the support of the whole community. As to the effect at the present time of procrastination in Washington upon our industries, we emphatically declare that not until a tariff bill of some sort is passed and signed can the country hope for any improvement either in commerce or manufacture. The immediate outlook is from bad to worse; the longer the period of uncertainty the more cumulative the depressing effect upon business, and especially upon our so-called laboring classes.

A Pennsylvania manufacturer of heating apparatus writes:

Owing to the very unsettled condition of things at this time it is very hard to make any calculations for the future so far as business is concerned. We had a prosperous, increasing business all along until our representatives at Washington began at the tariff. Then it seemed the bottom dropped out at once. We were busy all during the time of the extra session; the silver bill did not affect us and we passed safely over its repeal. But after the tariff matter came up we began to lose business and have been losing ever since. But we hope that things may make a turn for the better soon.

The Future.

It is needless to speculate as to the future in this line of trade. It depends essentially upon the condition of the building interests. If business at large revives and enterprise becomes stimulated, buildings will be erected needing heating apparatus, old heaters will be replaced with new ones and the trade will flourish.

Master Fitters' Association.

It will not do to pass over this department of business without a reference to the Master Steam and Hot Water Fitters' Association of the United States that is doing efficient work in bringing the heating engineers together at their annual convention, smoothing out business difficulties and in various ways furthering and advancing the trade.

HEATING NOTES.

AT THE BEGINNING of the year several consolidation schemes were talked about in the steam and hot water trade and some were effected. This made quite a difference in the competition among individual firms, and has altered the business not a little. Whether these consolidations are to prove per-

manent, as was expected when they were formed, is conjectural, and, in fact, hints are heard that harmony is giving away to discord.

PREPARATION is being made by W. M. Mackay, manager of the heating department of Hart & Crouse, Utica, N. Y., for a better display of the Royal steam, hot water and hot air goods at his new sample rooms and storehouse, at 211 Water street, New York.

W. H. OAKES of Boston left the compliments of the season in person at the office of the American Boiler Company, New York.

GEO. E. DOWNE of Chicago has been spending a few days with the American Boiler Company, at 94 Centre street, New York.

THE IDEAL HEATING COMPANY have been incorporated in Oskaloosa, Iowa, with $100,000 capital, to manufacture Phelps' Ideal heaters. The new firm, of which Chas. Phelps will be president, will absorb the Sanitary Plumbing Company of that city. Mr. Phelps was formerly secretary of the Sanitary Plumbing Company.

KEGGIE BROTHERS of Joliet, Ill., are preparing to push the sale of the Treat house heating boiler. They have purchased the property adjoining their present plant, 150 x 68 feet, on which they intend to erect an extension.

Miscellaneous.

Among the constituency of *The Metal Worker* are counted the representatives of several industries which, although not coming actually under the heading of any one of the leading trades to the interests of which this journal is committed, yet are so far in touch with those trades as to make a brief account of their condition both acceptable and useful to our readers. All these industries, without exception, have shared in the ill effects of the country's general business depression, in a greater or less degree, and the tale of sharper competition and diminished margin of profit is common to nearly every one of them.

Foundries and Machine Works.

Jobbing foundries and machine works in New England, Pennsylvania and in some Western and Southern States have been heard from. All the reports indicate a material falling off in the volume of business for the year. The decline is variously estimated at from 25 to 50 per cent., usually confined to the last six months of the year. Competition is generally referred to as being more formidable and profits much narrower, while prospects show no sign of present improvement.

Foundry Facings and Supplies.

A large manufacturer of foundry facings and supplies in a Western city writes as follows:

The business of the first half of the year was probably 33⅓ per cent. over last year, but the latter half fell off as much as or more than the gain of the first six months. Competition is more active, and the margin of profit considerably less—1, on account of the smaller demand for goods; 2, to increased competition, and 3, because a lower class of goods is being introduced than was the case formerly. More or less of our customers who manufacture goods which are highly protected are in a quandary how to act; therefore their plants are not in operation and we suffer as much as they do.

Portable Forges.

An Eastern maker of portable forges mentions having found his volume of business 20 per cent. less than that of 1892, although competition was no stronger and prices lower.

Wheelbarrows, Trucks, &c.

Some prominent Western makers of wheelbarrows, trucks, road scrapers, &c., have fared better than most of their neighbors, as their sales have declined only 10 per cent., a comparatively good showing in such hard times. They report that competition is stationary, and that profits remain on the same level as in previous years. They have been actively engaged in perfecting improvements in their goods. "We have run our shops," say they, "with our full regular force during the entire year, but since September 1 eight hours per day instead of 10. We have not lowered wages, and do not intend doing so."

Brass Goods.

Generally speaking the business in brass goods declined considerably in the latter months of 1893, in some cases as much as 50 per cent., although a prominent New England manufacturing firm report an increase of 10 per cent. in sales over 1892. Competition has not apparently increased to any remarkable extent, but this may be attributed to the fact that a number of producers were shut down altogether during the dull period. Prices, however, were extremely low, and profits correspondingly small in consequence. A growing demand for first class goods is noted.

Wire Goods.

Manufacturers of wire cloth, fencing, netting and other wire goods in both the Eastern and Western States write of a loss of business in the last half of the year, although previous to that their sales were well up to or in excess of normal. A Pennsylvania firm reports as follows: "Since August 1 jobbers order very cautiously and only for their immediate wants. Their orders are usually small, only about half what they had been before, and many of them seem to have no call for the goods—have not ordered since the spring. The falling off on August 1 was marked and well defined. Trade up to that date had been excellent, even July was better than usual for July." There seems to be little new competition in the trade, but those already in the field were more active in seeking business, the result being lower prices and a smaller margin of profit.

Paints and Cement.

The paint and cement trades felt the stringency in full measure. A leading Eastern concern, who are accustomed to calculate a large increase of business every year, confess to a falling off to the extent of 20 per cent. Competition is not appreciably greater, nor is the margin of profit much less on these materials. Complaint is, however, made of slow payments and bad debts, one firm stating that the latter item, which does not usually exceed ½ per cent., amounted this year to 4 per cent., owing to the failures of customers, while their best paying customers took unlimited time to settle their accounts. A Southern cement concern gave quite a gloomy report of their year's business, which they say has been 75 per cent. below the average, while the margin of profits has been reduced 50 per cent.

Lanterns.

A manufacturer of lanterns in the East estimates that his business has been adversely affected by the financial stringency to the exteut of from 30 to 40 per cent., while the outlook is far from promising.

Reflectors.

A correspondent who is a maker of reflectors for lighting public buildings, churches, &c., is happily able to report the unusual experience of 20 per cent. increase in the volume of his business. This was offset to some extent, nevertheless, by a declining margin of profit. The prevailing dullness in the building trade does not present itself to him as holding promise for a good business this year.

Aluminum.

The many uses to which aluminum can be adapted have caused such a rapidly increasing demand for the metal as to keep up quite a brisk trade while most industries have been under the weather. One of the leading reduction companies in the Middle States informs us that the volume of business transacted by them has been 150 per cent. greater than that of 1892, and that it has grown in this proportion every year since 1888. Had the financial stringency not intervened, however, the proportion would have been much larger last year. The selling price of aluminum has been materially reduced during the year, consequently the margin of profit on individual sales has proved much smaller. Competition is not excessive, the industry being, so far, confined to comparatively few manufacturers.

Mica.

Manufacturers of mica goods and dealers in the mineral speak of increased business in 1893, but with rather less profit in it. Competition does not grow stronger, nor is the anticipated tariff bill likely to affect the industry.

Gas Meters.

An Eastern concern manufacturing gas meters have felt the recent general stringency in money affairs to the extent of a shrinkage of 30 per cent. in their year's sales. They have seized on the dull times to make a number of im-

provements in their tools and methods in the direction of economy and quickness of handling. The outlook they believe to be good, as business is thought to have reached its lowest point already. The Wilson tariff bill would affect this business so far favorably as to give them cheaper tin plate, but its indirect effects would be more intimately and unfavorably felt through those produced on their customers.

Thermometers, &c.

Thermometer and instrument makers report less business since July than for a long time previous, with sharper competition among the members of the trade. Some notable advances have been accomplished during the year in the direction of efficiency and cheapness—particularly in the line of thermometers for mechanical purposes.

New York Trade School.

THE thirteenth season of the New York Trade School, at Sixty-seventh street and First avenue, New York, was opened by an assembly of the scholars for the new day classes of the different trades in the lecture room at 3 30 o'clock last Thursday afternoon. The room was filled with a larger number of young men than has ever entered the school in the past, which is substantial evidence of the appreciation of the excellent institution founded by the late Col. Richard T. Auchmuty.

The opening address was made by Harry Brill, clerk of the school, who explained that the institution represented the most cherished ambition of its founder, and that by his death during the past year not only the institution but the young men of the country had lost an inestimable friend. In the past he had enjoyed extending a cordial welcome to the young men who had come there in search of knowledge that would make the world better for their having lived. The school had been so established and perfected by the founder that it must continually increase in usefulness. Mr. Brill then introduced R. Fulton Cutting, chairman of the Board of Trustees.

Address of Mr. Cutting.

Mr. Cutting, among other things, said: "I am glad to meet so many pushing young men, as I appreciate that there are both motive and determination back of the decision to become educated and skilled workmen, and you can rest assured that the most intelligent and skillful workmen are always in demand. Every effort will be made to advance you beyond many of the workmen of to-day in the practical science of the trade you have selected. One of the things not taught as a part of any of the trades or belonging to any particular trade, yet essentially necessary to success in all, to which I wish to call attention, is honesty, absolute, strict honesty that would prevent the substitution of cheaper materials to increase profit or any similar subterfuge. I hope every scholar will appreciate this quality and cultivate it until he establishes a reputation which he will find is invaluable.

"Another characteristic that you will find indispensable to success, no matter in which trade you work, is industry. The man who is always busy, earnestly, honestly and intelligently working, is on the road to success and sure to prove a valuable citizen. Young men, you are in a large city and all of you may have a curiosity to see 'the elephant.' You will find plenty to act as showmen, but the sight will be more expensive than beneficial. I warn you against it, not that any special restrictions will be placed upon you, for your own sense of right will govern your behavior. To any who may get into trouble of any kind, come to your friends first, for while I hope that none of you will have any misfortune I shall be ever ready to extend a helping hand or give such information and advice as may be desired, for I do not want any of you to suffer when a few words with me will prevent it."

The Method of Teaching.

was then explained by Mr. Brill, who spoke, in substance, as follows: "Capable instructors will give you manual training, and by frequent lectures, scientific information on the different trades will be given. Close attention will be necessary, as frequent examinations will be made to learn of your progress. At the end of the term you will be subjected to an examination, which, it has been said, would be difficult for many workmen to pass; but by diligent work and careful attention at the lectures, any pupil will be readily able to pass it. A record book is kept of your attendance and progress, so that the welfare of no pupil is lost sight of, and a good record is desirable at the end of the term. The school has a repository for money, so that the risk of carrying a sum of money can be avoided and such amounts as may be needed can be drawn as required. This has been found a great convenience to scholars in the past. I caution you to take care of your health in the changeable climate of this city; and should you need medical treatment, or be taken ill, arrangement has been made with near at hand hospitals for your benefit."

Address of Mr. Thomas.

J. Stanly Thomas was next introduced, and in his address he said: "I am impressed that we are all strangers in a great city, but a cordial welcome awaits you all at the dormitory, where a brotherly feeling will increase the pleasure of all. I shall endeavor to get near to the hearts of all of you in our dormitory life and to win your confidence, so that the place will seem like a home to you. I shall be devoted to your interests, and will be ever ready to hear how I can do you a favor. I recount to you the kindness and earnest interest the instructors have extended to their apprentices in the past and recommend that you place perfect confidence in them, and I feel sure that all will be pleased with the result. I again counsel you to forbearance and courtesy in your behavior and industry in your work, that the time you spend here may pass quickly, happily and beneficially."

Mr. Brill then dismissed the boys, who were personally greeted by both Mr. Cutting and Mr. Thomas.

The numbers in all the classes are at top figures this year, the day class in carpentry having 25, in bricklaying 17, in painting 11, in sign painting 11, and in plumbing 143 apprentices. The plumbing class, which might have numbered 200, far exceeds all previous classes and overwhelmed the provision made for it, so that, though several new benches have been erected, many applications have had to be rejected.

The members of the class this year come from all parts of the country, as is shown by the following list:

DAY PLUMBING CLASS 1894.

Thos. J. Adams, Yorktown Heights, N. Y.
Richard J. Angell, Oxford, Mass.
Louis Arndtstein, New York City.
Christopher Atkinson, Columbia, S C.
Luther M. Barnes, Collinsville, Conn.
Vincent M. Barnes, Great Neck, L. I.
Thomas E. Barry, Boulder, Col.
Edward Battle, St. Thomas, Ontario, Canada.
William F. Baum, Bethlehem, Pa.
Bertie C. Beach, Greene, N. Y.
Albert R. Becker, New Orleans, La.
Adam Berle, New York City.
Louis P. Bitz, Portchester, N. Y.
Walter H. Blair, Westfield, Mass.
W. Asahel Blakeslee, Westfield, Mass.
Herman T. Bohlman, Brooklyn, N. Y.
Eugene F. Bouque, Moberly, Mo.
Fred'k F. Bowron, L. I. City, N. Y.
Jas. H. Boyd, Chicago, Ill.
Francis P. Brady, Johnstown, Pa.
J. T. Brady, New York, N. Y.
Walter B. Bratton, Lewistown, Pa.
Geo. S. Bray, Hazelton, Pa.
John M. Briggs, Meridian, Miss.
Nimrod Bryant, Edwardsdale, Pa.
Emmer Buck, Knoxville, Pa.
James F. Clarke, Lewistown, Pa.
Charles E. Cragie, Lancaster, N. H.
Henry W. Crane, Elizabeth, N. J.
Allen E. Custer, Bridgeton, N. J.
Geo. Dannenfelser, Westchester, N.Y.
Albert M. Darling, Jr., Riverhead, N. Y.
Ira De Baun, Hackensack, N. J.
Wm. J. Dent, Skaneateles, N. Y.
Frank Desmarias, Pont du Sault, P. Q., Canada.
Elmer B. Doolittle, New Rochelle, N. Y.
Chas. O. Dougherty, Altoona, Pa.
John E. Dugan, Albany, N. Y.
John W. Duncan, Lowell, Mass.
Wm. A. Dunn, Newark, N. J.
John M. Edgar, Hyde Park, N. Y.
William Edgar, Hyde Park, N. Y.
John J. Engel, Elizabeth, N. J.
John N. Enright, West Point, N. Y.
Herbert Fay, Plantsville, Conn.
Geo. G. Fender, New York, N. Y.
John Finigan, Paterson, N. J.
Harry Fisher, Pottsville, Pa.
Harvey N. Foster, Waterbury, Vt.
Luther E. Foster, Claremont, N. H.
Wm. G. Foster, Pittston, Pa.
Wm. Foulois, Washington Depot, Conn.
Peter J. Garvin, New York, N. Y.
John J. Gilligan, Wilkes Barre, Pa.
Maurice Gould, Campbell, N. Y.
Cornell Grav, Onadaga Hill, N. Y.
Milton O. Hager, Johnstown, Pa.
Alvin W. Hand, New York, N. Y.
John A. Harris, Plymouth, Mass.
Albert Hart, Jr., Pearsall, L. I.
Thos. W. Hawkins, Tottenville, N. Y.
Ralph W. Hawthorne, Elgin, Ill.
Frank E. Hayden, Cassopolis, Mich.
Chas. H. Higby, Port Jervis, N. Y.
John Hoeman, Chicago, Ill.
Elwood Hutton, Portsmouth, N. H.
Richard Ingalls, Lowell, Mass.
Geo. C. Jenks, Goffstown, N. H.
Ossian Johnson, New York, N. Y.
Wm. J. Juergens, Wheeling, W. Va.
Chas. Kallman, New York, N. Y.
Martin Kenley, East Winsted, Conn.
James J. Kenny, New York, N. Y.
Albert F. Kenny, Salem, Mass.
Theo. A. Klenke, New York City.
Chas. L. Kuhls, College Point, L. I.
Edward W. Long, Louisville, Ky.
Benj. Lowenthal, Rochester, N. Y.

Thomas F. Lowndes, Jr., New York, N. Y.
Ellison A. Lowndes, New York City.
Matthew Mackey, Olyphant, Pa.
Geo. B. McCollum, Oil City, Pa.
Peter McCormick, New York City.
John McNanamy, Lancaster, Ohio.
Patrick J. Moriarty, S. Hadley Falls, Mass.
Reginald Morton, Chiltonville, Mass.
Guido Muller, Brooklyn.
John H Mulligan, Vicksburg, Miss.
Thomas Nisbit, Elizabeth, N. J.
Charles J. O'Hanlon, Savannah, Ga.
Tracy O'Hara, Paterson, N. J.
Fredk. W. Otte, Peekskill, N. Y.
James H. Peck, Port Jervis, N. Y.
Wm. Peterson, Paterson, N. J.
Geo. A. Pinchbeck, New York, N. Y.
Wm. J. Pulte, Grand Rapids, Mich.
Thomas J Quicke, West Point, N. Y.
James P. Rand, Lakeport, N. H.
Frederick Reagan, St. Stephen, N. B., Canada.
Frank L. Recker, Altoona, Pa.
Chas. H. Redfield, Sag Harbor, L. I.
Robert M. Rees, Pocahontas, Va.
J. W. Reese, Cazenovia, N. Y.
Geo. M. Rhoads, Reynoldsville, Pa
Eugene Royce, Avon, N. Y.
Pearl B. Rutledge, Bellefontaine, Ohio.
Wm. A. Ryan, Hamilton, N. Y.
Edwin M. Sargent, Haverhill, Mass.
Theo. Schumacher, Jr., New York City.
George W. Seelig, New York City.
Joseph R. Semler, Newburg, N. Y.
Thomas H. Solomon, Jermyn, Pa.
George H. Soult, Lewistown, Pa.
Fred. R. Spates, Eastport, Maine.
John G. Stack, New York, N. Y.
Henry M. Streeter, Glen Cove, L. I.
Wm. E. Sullivan, Ridgefield, Conn.
Geo. I. Sullivan, New York, N. Y.
Fred'k M. Swartwout, Congers City, N. Y.
Wm. Thompson, New York City.
Edward Train, Passaic, N. J.
Frank H. Trexler, Williamsport, Pa.
Thos. L. Tryon, Elizabeth, N. J.
Oliver M. Tucker, Newark, Ohio.
Peter J. Tyrrell, Naugatuck, Conn.
J. Frank Updegrave, Johnstown, Pa.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until January 25 for work, including the plumbing of the United States Post Office Building, at Cedar Rapids, Iowa. Plans may be obtained from the superintendent at Cedar Rapids, Iowa, or at the office of the Supervising Architect, Washington.

The opening of California's Midwinter Fair, at San Francisco, on New Year's Day was attended by most favorable weather and a large and enthusiastic crowd.

Review of the Tin Plate Trade

THE extraordinary depression which pervaded the business of the country generally during the latter half of 1893 was keenly felt by the tin plate trade. Reports with which we have been favored by members of the trade in all sections of the United States, whether manufacturers, importers or jobbers, indicate a marked falling off in the volume of sales, dating generally from about July 1. During the earlier months of the year the trade was, on the whole, eminently satisfactory, and fully up to, if not beyond, the average. The influence of the bugbear of "financial stringency" in the dark days of July and August, however, worked a great change. Collections of outstanding accounts became difficult, and merchants became more guarded in making credits. Money was scarce with consumers, and as dealers largely were cautious about making sales, except to old customers, on other than a cash basis, the trade resolved itself into a hand to mouth business, which has been its distinguishing feature ever since.

Reduced Consumption of Plates.

The large consumers ceased to forestate their requirements and restricted their purchases to such quantities as they absolutely needed for current work. The closing down of several large factories using tin plates and the reduction of operations by nearly all the rest shut off a large portion of the consumptive demand. The canners of the country, who are the largest consumers of coke plates, being in many cases unable to obtain the necessary advances from bankers, were forced to cancel orders, and those of them who had not already laid in their stock of material suspended their usual operations. Similar causes influenced the smaller consumers, consequently the trade was reduced, after July, to the narrowest proportions. The falling off was, perhaps, most marked in the Eastern and Middle States, where it is variously estimated at from 10 to 40 per cent. We present herewith extracts from the reports of some of our correspondents in that section, which gives a good idea of the course of trade during the year. A prominent New York importing firm write at the close of the year as follows:

There has been considerable falling off in the volume of business, especially within the last few months. Competition has very materially increased, as, trade being dull, there has been more disposition to cut prices and push sales, consequently the margin of profit has been much less. The outlook is very discouraging. Owing to the uncertainty about the tariff there will be but little new building, and all trades that consume our goods will be stopped or greatly retarded till the matter is settled.

A Boston firm of jobbers place the decrease in business at about 25 per cent. as compared with that of 1892. In regard to the outlook for 1894, they say: "We look for a year similar in results to the past—possibly a little better." Speculative buying, or buying for future consumption, they have seen none, they add, since the financial stringency.

A house in the trade, doing business in a city of the United States, who are manufacturers as well as importers, express their belief that the trade will adapt itself to whatever reductions the Wilson bill may make. Tin plates, they think, will not be any lower, for, in case of a reduction of duty, English prices will advance.

Manufacturers' Views.

A tin plate manufacturing firm in Pennsylvania remark as follows in regard to the effect of the financial stringency on their business:

The financial stringency, by reason of impairment of credit, abandonment of projected buildings and failures to pay, has been the main cause of shrinkage in sales; 50 per cent. would be about the lowest estimate. The railroads being heavy consumers of our goods used practically nothing, and kindred concerns ditto.

The same firm mention that an increasing demand for a poorer quality of plate has been one of the results of the hard times. Furthermore they remark:

There is a tendency to make a cheap, unreliable article in order to undersell, which has a great deal to do with the adverse reports you see about American plate. We also think that it is a big mistake to use the tariff as a party issue. Constant agitation of the subject is bad for business, and there ought to be a commission to frame a bill and let it go at that for ten years, merely correcting any irregularities.

Another of the largest manufacturing firms in the East report a falling off in sales of 40 per cent., with much keener competition and a constantly decreasing margin of profit.

A third manufacturer, whose works are located in the vicinity of Pittsburgh, speaks of a reduction of business by one-third, due to the tariff agitation. The effect, he believes, of the reduction of duty contemplated by the Wilson bill will be visited on labor in tin plate works, where wages will have to be reduced to meet the increased competition of foreign plates.

Another manufacturer in the same district believes that the introduction of the lower tariff would result in a loss of business and money, especially to those who have invested heavily in tin-plate plants. Matters, he believes, would finally adjust themselves, but in the meantime, "the American trade would suffer, while foreigners would benefit.

The Western Trade.

Tin plate merchants and manufacturers in the Western States have, possibly, escaped the storm better than their Eastern brethren. Yet they, too, complain of a smaller volume of business of 10 to 25 per cent. as well as diminished profits and cutting of prices in some quarters. This feature does not appear to be so emphatic in the Western as it has been in the Eastern market. The tin plate works located in the Western States have, on the whole, come well out of the year. Many of them, though reducing their output, have kept their plants in operation almost continuously and have found a ready market for all their product. The use of domestic tin and terne plates appears to be growing in a more marked degree in the Western States than in any other part of the country. We learn from several correspondents that consumers are largely adopting the use of the native article exclusively on account of its intrinsic excellence. One jobbing firm, with a large Western connection, write to us in the following terms:

This year has been remarkable with us chiefly in showing a steady and constant growth in favor of American tin plates. The result is that to day we are selling over three times as many American plates as we do of foreign, and if it were not for the impending change in the tariff we think the time would not be far distant when our only sales of the foreign goods would be in odd sizes not yet made by American manufacturers.

The American Industry.

The growth of the domestic tin plate manufacturing industry up to the end of the second quarter of the year, as exhibited in the reports of Col. Ira Ayer, fully maintained the opinion of its vitality expressed in our review of a year ago. During the last quarter for which official reports have been published, namely, that ending June 30, 1893, the production of American tin and terne plates was nearly 40,000,000 pounds or almost 50 times as much as that for the first quarter after the McKinley tin plate duty took effect. During the September quarter the manufacture fell to much below what it should have been, because so many mills and tin houses were constrained to suspend operations in consequence of the general financial stress, wage disputes, &c. Nevertheless, the output was on a very fair scale, considering all the disturbing elements. The December quarter has seen the resumption of nearly all of the suspended works, and its record of production will, doubtless, make a good showing.

New Works and Extensions.

During the year several new tin plate works have started up, including one or two of the first magnitude, notably that of the New Castle Tin Plate Company, New Castle, Pa., and the large plant of E Morewood & Co., at Gas City, Ind. A number of others have increased their size and capacity by erecting larger buildings or by the provision of additional tinning machinery. Only two or three concerns have suffered by the prevailing stringency to the extent of failure or suspension.

Taken as a whole, therefore, the American tin plate manufacturing industry has displayed a remarkable degree of stability as compared with most other enterprises. The effect that the change in tariff on tin plates and black sheets, as proposed in the Wilson bill, will have on the nascent industry remains to be seen, but to many cool and impartial minds in the trade the prospect does not seem to promise such alarming results as were at first freely predicted by domestic manufacturers and others. The impression held on the subject by some of the manufacturers will be gathered from the extracts we have before given.

Improvements in Manufacture.

A general showing toward economy and efficiency in the manufacture of tin plates has been a marked feature of the year's trade history. American invention has been stimulated toward the improvement of tinning machinery, and several patents have been awarded in this line, as well as for new coating processes and for labor saving machines for cleaning and polishing plates, &c.

American Black Sheets.

The increase in the home manufacture of black sheets for tinning purposes has been quite notable, as well as the improvement in their quality. A growing number of mills are now making a specialty of this material, and report a ready demand for all they are able to produce. Prices of black sheets have also been lowered to such an extent as to make their use, in point of economy, a desirable object to those concerns which do not produce their own. The proportion of American tin plate works that now use domestic sheets exclusively has increased every month, and of all the tin plate now dipped in this country at least 50 if not 60 per cent. is made of sheet steel rolled in the United States. The American roofing plates have now so established their reputation as to have virtually ousted the imported material from the market, while the bright plates turned out by the home makers are admittedly unsurpassed in quality.

The Metal Market in General.

We print, in conclusion, an interesting memorandum on the tin plate and metal market issued by the well-known firm of Bruce & Cook of this city, which contains a valuable review of the situation from the jobbers' point of view. They write on January 1, 1894, as follows:

We regret that a more favorable report of the year just closed cannot be given. The early spring disturbance in the monetary affairs of this country came so suddenly, and with such force, as to almost completely upset all calculations in regard to future business transactions, and its results were so disastrous as not only to make serious losses in the decreased value of all kinds of merchandise, but also caused more or less distrust in all lines of credit. It would appear that this disturbance was caused more by fear than by any actual conditions which would warrant so great an amount of distrust. The legislation at the special session of Congress, called specifically to deal with the currency question, was such as to insure, we hope for many years to come, a strong and solid foundation for our currency.

The question of tariff revision which is now before the country will no doubt keep matters in a more or less unsettled condition until it is finally passed and the country adjusts itself to the new conditions under which business may be done. Meanwhile uncertainty as to the exact changes to be made and the date upon which they shall take effect will hamper all lines of industry which are affected. It seems to us that the sooner the matter is acted upon and settled definitely the better it will be for the prosperity and well being of the country. For several months there has been a large decrease in the production of all lines of goods, especially those connected with metals; and while there is no question that consumption has also decreased, and that there are a large number of men out of employment, we see no reason why a return to former prosperity may not be looked for early in the coming season, especially if before that time tariff matters are finally adjusted. Without exception, all goods in the metal line are at exceedingly low prices, and any return to the usual output of manufactured goods must give an increased impetus to labor and manufacturing, which will equal, if it does not exceed, that of former years.

It is a source of gratification to be able to say that nearly all branches of the metal and kindred trades have shown remarkable strength during the last few months, and we think a smaller percentage of resulting failures has occurred than in almost any other distinct line that can be named. We believe this is owing largely to the method of doing business, which is mostly for spot cash, or on very short time.

SCRAP.

ST. LOUIS STAMPING COMPANY, St. Louis, Mo., report a large and increasing demand among Western consumers for their American roofing plates, including the S. L S. Old Process, S. G., and Extra Fine. So much is this the case that their product in this line is absorbed as fast as it is turned out from the company's works.

JOHN HAMILTON, 62–64 Third avenue, Pittsburgh, Pa., manufacturer of Hamilton's Best Redipped American roofing tin, is sending out to the trade pads for memorandum purposes, which will doubtless be found very useful by those receiving them. At the top of each sheet in the pad appears a statement commending the qualities of this brand of roofing plate, while on the body of the sheet appears the words in light letters, "Hamilton's Best Redipped American Roofing Tin." The object sought is to keep this brand constantly before the trade, and it will no doubt

be attained. All through the severe business depression existing during the last six months of 1893 this firm have been in operation right along, meeting with a ready demand for their plate. The outlook for this year is exceedingly encouraging, as it is believed that building operations this year will be much more extensive than last year.

In refutation of the oft-repeated statement that tin plate was not and could not be made in this country on a commercial basis, we are permitted to give below the amount of monthly sales of tin and terne plate made during 1893 by one of the prominent concerns located in the West. In presenting these figures the fact should be noted that the entire works were closed down for about ten weeks last summer, during which time not a wheel was turned. The total sales represent only tin and terne plate, with the exception that early in 1893 a few tons of black sheets were marketed by the firm. The monthly sales of the concern in question for each month of 1893 were as follows:

January	$30,843.04
February	40,795.60
March	66,239.60
April	49,546.77
May	65,017.54
June	32,272.67
July	22,193.18
August	14,960.62
September	47,639 27
October	46,406.68
November	49,864 55
December	47,174.54
Total	$512,954.06

The above figures are absolutely reliable, having been taken from the books of the firm.

Hardware and House Furnishing Goods.

THE year in the hardware and kindred trades has been one that the majority of manufacturers and dealers would not care to repeat. Like the other lines of business reported by *The Metal Worker*, these trades have suffered not a little since last January. In accordance with the general business situation prevailing throughout the country, the first six months of the year developed considerable activity, and if the final balance could have been struck on July 1 the majority of business houses would have looked back on a prosperous season. Unfortunately, however, it was not possible to sleep through the remaining six months, and the losing trade of the last half of the year more than offset the profits of the spring.

Hardware.

In the hardware and miscellaneous house furnishing trades, the reports that we have received from manufacturers, jobbers and dealers show a considerable falling off—hardly any report a gain—the average losses being in the neighborhood of 25 to 30 per cent. While the record of the past is invariably gloomy, the outlook for the future is not considered so hopeless—that is, opinions vary considerably, and not a few of our correspondents are adverse to prognostications of any sort. They point out certain good features in the situation, and likewise draw attention to evil tendencies at work. It is not considered, however, that in the immediate future there is to be much resumption of activity or any betterment in prices. An example of the effect produced in the house furnishing trade by the financial stringency of the summer is well indicated by the figures furnished us by a firm in the central western part of the country. During the months of August, September and October their business declined 33⅓ per cent., as compared with the same period last year. In November the reduction was 25 per cent., and in December the falling off was 20 per cent. The sum total for the year being practically the same as last year, indicated that during the first six months a very considerable increase in activity had been enjoyed.

It would surprise, in some measure, the politicians of all sorts to learn how very general the feeling was against the political activity that has afflicted the country during recent years. Examples of the opinions held on the general question of tariff, without reference to the particular changes recommended, are shown in some of the letters, from which we quote as follows :

One of the manufacturers in New Jersey says : "Give us a stable system of finance, a sound national bankrupt law and an equitable tariff of a permanent character and the future will be prosperous. However, as the tariff is the only bone of contention between both parties, it is certain that the discussion of the question will continue for years Therefore the effect upon business will be to put manufacturers to their wits' end to know what course to follow in making stocks, the value of which may be changed from 10 to 25 per cent. by tariffs created by men most of whom are fourth rate country lawyers who are fond of tinkering with the tariff."

Tinware.

The record of the year as furnished by tinware manufacturers is in keeping with the reports that have come to us from other makers of housefurnishing goods, hardware and similar articles. Practically all of them have done less business during 1893. The largest reductions amount to about 50 per cent., unless we include certain unfortunate concerns who were driven entirely out of existence by the financial stringency and other difficulties of their business. The average would show about 30 per cent., and this loss meant a much greater falling off in business during the last half of the year, for the business up to July was in most cases prosperous and greater than during the same season a year ago. One very prominent firm of manufacturers describes the situation by saying that, in spite of increased facilities for doing work, their business had decreased 30 per cent. from last year.

The future is unsettled, but most of our correspondents do not take a very rosy view. Some think that the first six months of the year will be dull and bad, and that after July 1, or thereabouts, there will be an improvement in industrial conditions. Others point the period of depression with the settlement of the tariff question, and think after that business will improve. There is a variety of opinion on the tariff question among the manufacturers of tinware, some of them holding that while it is probable that the tariff proposed in the Wilson bill will reduce the price of the raw material, yet the general effect on the country at large will be harmful, and that therefore, indirectly, they will suffer.

Refrigerators.

Among the most favorable reports we have received in regard to last year's business are those from the refrigerator trade. Save in one or two instances, where exceptional circumstances were operative to depress business, manufacturers of refrigerators all speak of the very satisfactory volume of business during 1893. This, however, is almost wholly due to the exceptional position of the industry. The trade in these goods is largely confined to the spring and early summer months, and but little business is usually looked for after July 1, the period from which most trades date the beginning of decline, consequently the financial stringency affected this industry to but a small extent. Its influence will probably be more felt during the coming season, for the reason that the lack of money will prevent many people who would otherwise have used these goods from investing in them. As a Western manufacturing concern express it:

It is the laboring class at the present time who are the large purchasers of refrigerators. The wealthier people have used them for years, while the poorer people are just beginning to recognize them as a necessity. Should tariff legislation cut off to any large extent the income of the working classes, they would be obliged to get along without refrigerators as they have done in the past.

The tendency in "season goods" has been to make the manufacturer carry the stock. Last season, we learn, many orders were lost owing to this being the case. There is, however, an indication that jobbers are inclined to change this idea to some extent, and to lay in at least a fair working stock before the season opens.

Several of our correspondents complain that their margin of profit has been adversely affected by reason of bad debts caused by the financial stringency. We are informed by a manufacturing firm in Wisconsin that their 1893 trade was double that of 1892, and that their sales for delivery in the present year already exceed their deliveries during the past year. This concern are probably exceptionally fortunate in this respect, and their experience is, therefore, no criterion of the condition of the refrigerator trade in general. They consider that last season was the best year for the sale of refrigerators on record.

A general tendency is noted to improvement in goods in the direction of efficiency and decorative effect. The majority of concerns report having enlarged their facilities or added to their lines of manufacture during the year. Competition has not increased to any sensible extent.

STOVE TRADE NOTES.

The Stove Trade of 1893.

BY GEO W COPE.

THE CONTRAST between the stove trade of 1892 and that of 1893 was marked. The good condition of business which had prevailed for several years culminated in 1892, when the demand surpassed anything known in recent stove history. Everything in the line of cooking and heating apparatus found buyers. The record of 1893 was very different.

The Financial Panic.

The usual preparations were made by manufacturers for a fair year's business. Spring trade was of about its usual proportions, but when midsummer came, and the time had arrived when manufacturers were wont to fill their books with orders for fall shipment, the chill wind of a financial panic was sweeping over the country, blighting all enterprise. July and August are ordinarily months of heavy business, but 1893 proved a woful exception. Trade was dealt a staggering blow. Orders that had been placed early were countermanded. Credits were so seriously impaired that salesmen were withdrawn, because it was uncertain that goods would be paid for even if contracts should happen to be secured. Money suddenly became so scarce that foundries were shut down wholesale for lack of actual cash to meet running expenses and pay workmen. Fully three-fourths of the stove manufacturing capacity of the country is estimated to have been idle in August, at a time when the utmost energy is usually put forth to prepare for the fall trade. Many large foundries were closed for two months, and it is believed that the output for the year was thus reduced at least 500,000 stoves below what it otherwise would have been. Never before were manufacturers plunged into such a sea of uncertainty. A few failures occurred, but the number fell far short of what was feared, as rumor with its thousand tongues was busily attacking the credit of even the stanchest and best managed establishments.

In September there was a decided revival, as the crops proved fairly satisfactory and money was much easier. October was a month of excellent trade. Winter weather made its *début* in November, earlier than for several years, and caused something of a rush for heaters, but after that trade fell off again. Before the close of the year notices that stove foundries were shutting down grew painfully numerous in the daily newspapers.

Molders' Wages.

With the bad record of the year now spread before us the fact can be more fully realized how ill-timed was the demand for an advance in molders' wages which was made last spring. The workingmen based their claims on the prosperity of the preceding years and were determined to get a greater share of the benefits which they expected the trade to secure in 1893. Although some of their leaders refused to admit the soundness of the argument put forth by manufacturers that it was unreasonable to expect a prosperous stove trade in 1893 with general business languishing, discretion and common sense fortunately prevailed in the counsels of the labor managers. Threats of a strike for higher wages, which were so freely made in the spring months, became less forceful and were at length completely dropped when it was seen that molders might considers themselves fortunate if they were able to secure steady employment at their old wages.

If an advance had been conceded and the suggestion made by the workmen had been adopted that the price of stoves be raised to cover the increase in cost, it is now perfectly plain to all that the action would have been most unwise. It would have been a most unfavorable time to attempt to raise the selling price of stoves, even if supported by such an excellent excuse as an advance in the cost of manufacture.

Careful Methods.

The small number of failures among stove manufacturers during the year can be attributed, in great measure, to the fact that values were on a low plane when the panic was precipitated. There was very little room for shrinkage, as there was no inflation to be squeezed out. The resumption of manufacturing operations after the summer suspension brought with it no heavy depreciation in the value of stock on hand.

As the panic fortunately occurred between seasons and not while heavy accounts were outstanding for stoves sold and delivered, manufacturers were thus specially favored. It may be vexatious to be obliged to closely scrutinize credits, and disagreeable to deny old customers the full measure of confidence they enjoyed in former years, but it unquestionably has its advantages over worrying with bad debts and uncertain collections. The shortening of credits by manufacturers also had a salutary influence on a large class of retailers, who found themselves obliged to be more conservative in dealing with their customers, refusing time and insisting upon cash.

Matters are now in such shape throughout the stove trade generally that if times should materially improve next year manufacturers will be immediately and beneficially affected.

Stocks in retailers' hands and in makers' warehouses are light, perhaps lighter than for any year within the last decade. An improvement in the consumptive demand will therefore be communicated at once to manufacturers. That they are in better shape than ever to handle a heavy business is shown by the

Numerous Improvements in Plant

which have been made all over the country during the year in the stove and allied trades. There may have been some important improvements which have escaped the attention of the correspondents of *The Metal Worker*, but those which have been noted in our columns since January, 1893, are worth enumerating for their variety and in many instances their magnitude.

The Michigan Stove Company erected a new warehouse building at Detroit, 156 x 50 feet, to be devoted exclusively to the storage of castings and supplies.

George M. Clark & Co. of Chicago added to their old quarters an entire building, 150 x 50 feet, and five stories and basement in hight. They also took possession of two more floors in the manufacturing block in which their factory is located.

The Irwin Mfg. Company of Louisville, Ky., built an addition to their foundry, 50 x 30 feet, two stories in hight.

The Art Stove Company of Detroit increased their motive power for the third time since they commenced business, built an addition to their molding department and made other substantial improvements in their manufacturing facilities.

The Scranton Stove Works built an entirely new plant at Dunmore, Pa., fully equipped in every department for the rapid production of high grade goods, pouring the first heat on July 18.

The Taunton Iron Works Company of Taunton, Mass., erected a three-story

building, 60 x 50 feet, to be used as an addition to their mounting room and for storage purposes, as well as for offices.

Noyes & Goddard, at Waterville, Maine, poured the first heat in their new foundry on January 25.

The Brand Stove Company of Milwaukee completed a substantial building, 150 x 102 feet, four stories and basement in hight, to be used for offices, warerooms and storage of finished stoves.

The Kernan Furnace Company of Utica, N. Y., made extensive improvements in their works to meet the requirements of their constantly growing trade.

The Stuart & Peterson Company removed their works from Philadelphia to Burlington, N. J., where they have a thoroughly equipped modern foundry and enjoy greatly increased facilities for the production of stoves.

Buck's Stove & Range Company of St. Louis built a four-story warehouse over their foundry, making a substantial addition to their already extensive works.

The Ringen Stove Company of St. Louis topped their manufactory with another story, thus adding 200 x 75 feet of space, which was imperatively needed for the accommodation of a greater working force.

The Lehigh Stove & Mfg. Company of Lehighton, Pa., built an extension to their foundry, 74 x 64 feet.

The Joseph Bell Stove & Range Company abandoned their old works at Wheeling, W. Va., and commenced operations in the new plant at Muncie, Ind., on May 31, with three times their former capacity. A warehouse is still maintained at Wheeling from which to supply the Eastern trade.

The Ohio Stove Company of Portsmouth, Ohio, erected a large building to be used as an office and warehouse.

The Century Stove Company of Dighton, Mass., made an addition to their foundry and otherwise enlarged their producing capacity.

Foster Bros., proprietors of the Central Stove Works, at Lebanon, Pa., completed a well equipped plant, which was put in operation in the autumn.

E. Bement & Sons of Lansing, Mich., built an extension to their foundry, erected a large warehouse and made other improvements in their works, considerably extending their manufacturing facilities.

The Carton Furnace Company of Utica, N. Y., considerably increased their productive capacity.

The Detroit Stove Works have built a warehouse in Chicago, 200 x 112 feet, five stories in hight, which will give them more storage room and improved shipping facilities.

The Indianapolis Stove Company of Indianapolis, Ind., made additions to their foundry.

The Abram Cox Stove Company of Philadelphia erected a huge building, 500 x 126 feet, six stories in hight, to contain their offices and salesrooms, mounting department, tin and pattern shops, and also to provide needed storage room.

Knott, Harker & Co. of Beaver Falls, Pa., erected a two-story office building and machine shop, 80 x 40 feet.

The Quick Meal Stove Company of St. Louis erected a four-story structure, 140 x 59 feet, to be used exclusively for manufacturing. An increase in their business of 30 per cent. in one season is justification for the expansion in productive capacity.

The Thomas Roberts Stevenson Company of Philadelphia built additions to their plant, consisting of a foundry, 100 x 47 feet, and a three-story warehouse, 66 x 33 feet.

The Richmond Stove Company of Richmond, Va., erected a three-story office and warehouse building, 80 x 46 feet.

The Favorite Stove and Range Company of Piqua, Ohio, made further additions to their extensive plant, greatly increasing their capacity. The company were among the plucky minority in the trade who persisted in running full time during the panic.

The Bloomington Stove Company of Bloomington, Ill., built a new boiler and engine house and made other improvements.

White, Warner & Co. of Taunton, Mass., built a new foundry, 75 x 60 feet, so as to be able to employ a larger force of molders.

Hart & Crouse of Utica, N. Y., have prepared plans for new buildings to be undertaken in the spring, which will greatly increase their producing capacity.

The Raymond & Campbell Manufacturing Company of Middletown, Pa., have made an addition to their boiler shop, 78 x 30 feet, which was greatly needed to relieve the pressure on other departments.

A new stove foundry is being built at Fulton, Ill., on the Mississippi River, by the Mississippi Valley Stove Company, who will acquire the business of the Ohio Stove Company of Tiffin, Ohio. The works will consist of six fine brick buildings with metal roofs, and their manufacturing capacity will be considerably greater than that of the old works at Tiffin.

The Tuttle & Bailey Mfg. Company of New York and Boston opened a branch house at 136 Lake street, Chicago, to provide better facilities for supplying their registers to the Western trade.

The Armstrong Stove and Mfg. Company have succeeded Armstrong & Co., at Perryville, Md., and will extend their business.

The Pittston Steel Range Company have been organized at Pittston, Pa., for the manufacture of steel ranges.

The Jackson Mfg. Company of Hammond, Ind., is also a new concern organized during the year to manufacture stoves.

Fires.

Losses by fire during the year were not large when the extent of the stove trade is considered. Quite a number of unimportant fires occurred, but about the only ones worthy of mention were the following: Walker & Pratt Mfg. Company's warerooms in Boston and the Milwaukee Gas Stove Company's plant in Milwaukee, both of which were burned in January; Bridgeford & Co.'s warehouse in Louisville, Ky., and the foundry of the Lincoln Stove and Furnace Company, in Lincoln, Neb., in October; a small portion of the Peninsular Stove Company's plant in Detroit, and the Schmalzried Stove & Range Company's plant in Memphis, Tenn., in November; the warehouse and part of the molding department of the Auburn Stove Company, Auburn, Maine, and the plant of the Hanging Rock Stove Works, at Ironton, Ohio, in December. From the small size of this list stove works should be considered good risks by insurance companies.

Failures and Changes.

The most important failures during the year were those of the Sioux City Stove Works, at Sioux City, Iowa; the National Vapor Stove & Mfg. Company of Cleveland, Ohio, and the Wells Mfg. Company of Greenfield, Ind. The W. J. Loth Stove Company succeeded to the Waynesboro Stove Company of Waynesboro, Va.

Generally Interesting.

The World's Fair at Chicago, which has now passed into history, was a topic of much interest to stove men while preparations for the event were in progress. Ambitious plans were formed for the proper representation of the stove trade at this great gathering of the world's best products, but one by one they came to naught, and finally it was left to individual manufacturers to do what they thought best. The result was that the display made, while highly creditable to those who participated, fell far short of what had been expected from so great an industry. Many very prominent concerns were wholly unrepresented. What was lacking in quantity, however, was atoned for in quality. In this respect the display was superb. At no previous exposition were such stoves shown, so complete in all their appointments, artistic in appearance and rich in ornamentation. Every manufacturer aimed at originality in the construction of a booth or the arrangement of the exhibits, with most striking effect. Very few of them received awards, however, as at an early day during the progress of the exposition the great majority of the stove exhibitors withdrew their goods from competition and

declined to have them examined for premium or award.

An episode of the exposition is here worth mentioning. After the terrible calamity of the burning of the cold storage building, on the fair grounds, through which so many of the firemen lost their lives, the Michigan Stove Company offered to donate their highest cost and highest finished Garland cooking range and heating stove for the benefit of the firemen's families. They were to be disposed of by the sale of tickets, and the goods were to be delivered at the close of the exposition. The entire proceeds were to be handed over to the exposition authorities, whose approval of the scheme was asked. It was expected that several thousand dollars could be realized in this way, and the relief fund correspondingly swelled. But permission was refused, and the scheme was, therefore, dropped.

The Detroit Stove Works contributed greatly to the enjoyment of their patrons by running the Jewel Tally-Ho coach daily between the company's Chicago headquarters and the World's Fair grounds. Arrangements were made in advance for the passengers for each day, so that there was no confusion nor disappointment, and a large number of people from every section of the country enjoyed the company's hospitality. It was a six-mile drive over some of the finest boulevards in the world and through the most elegant residence section of the city.

The Brand Stove Company of Milwaukee celebrated the twenty-fifth anniversary of the establishment of their works on November 11. Invitations were issued to a large number of friends and patrons, who gathered at the company's offices and extended their congratulations.

On July 22 Isaac A. Sheppard of Philadelphia rounded out a half century of active participation in the stove trade, and the event was duly celebrated by a banquet at Warner Hall, Philadelphia, with 200 of his employees present. He served his apprenticeship with Warnock & Co., beginning in 1843, and in 1859 started in business on his own account.

Great records have been made in the gasoline and gas stove trades this year. George M. Clark & Co. of Chicago took what they believe to be the largest single order ever given directly by a consumer for gas ranges. It was for 128 with water heaters and 97 without, or a total of 225. These ranges were to be used in a large Chicago apartment house.

The Ringen Stove Company of St. Louis shipped the largest single car of stoves ever sent over any road in the country. The car, which belongs to a private individual, and was rented for the purpose, is 52 feet long, 10 feet wide and 11 feet high, and it was loaded with 300 stoves, mostly large sizes.

The Quick Meal Stove Company of St. Louis shipped 12 of their largest size and six picnic stoves to Johannisburg, South Africa. They enjoy a considerable export trade with a number of foreign countries. In the city of Milwaukee, with a population of about 225,000, no less than 2600 gas stoves were placed from January 1 to October 1.

Association Affairs.

The events of the past year have shown that stove manufacturers have by no means lost interest in the National Association. On March 16 the Stove Founders' National Defense Association met at Chicago to consider the propriety of advancing molders' wages 16 per cent., which had been asked for by the Molders' Union. It was decided that the condition of the trade and the business outlook for the year did not warrant an advance, but action was deferred until the next day, when a general meeting of stove manufacturers was held, which was well attended by stove manufacturers from all sections of the country. After full discussion of the subject they also came to the same conclusion, but being anxious to avoid a rupture with their workmen they arranged to have final decision postponed until the regular meeting of the National Association of Stove Manufacturers, which was to be held in Chicago on June 1. On the day preceding this meeting the regular annual assemblage of the Defense Association was held, at which the following officers were elected :

President, Henry Cribben of Chicago.
Vice-president, W. T. Bradberry of Pittsburgh.
Secretary, D. M. Thomas, Union Trust Building, New York.
Treasurer, A. C. Mott of Philadelphia.
Chairman of Committee for the Second District, Grange Sard of Albany, N. Y.
Chairman of Committee for the Third District, W. W. Baldwin of Cleveland, Ohio.
Chairman of Committee for the Fourth District, Chauncey H. Castle of Quincy, Ill.

The salary of the secretary was advanced 50 per cent. This action, together with his re-election, was a signal refutation of the charge made that general dissatisfaction was found with his administration of the office. When the National Association met on the next day a committee of molders appeared by invitation and the question of an advance in wages was again thoroughly discussed, with a positive decision against it. The matter was then wisely allowed to rest by the workmen, although for some little time there was apprehension of a strike.

Among other business transacted on this occasion was the election of the following officers:

Geo. D. Dana, St. Louis, president.
C. S. Prizer, Reading, first vice-president.
A. M. Blakesley, Rock Island, Ill., second vice-president.
D. M. Thomas, Union Trust Building, New York, secretary.
W. S. Stevenson, Philadelphia, treasurer.

The Board of Managers chosen was:
H. W. Buttorff, Nashville.
Henry Cribben, Chicago.
C. A. Ducharme, Detroit.
E. W. Peck, Rochester.
W. E. Walker, Taunton.

The members of the association expressed their satisfaction with the secretary by not only re-electing him, but also advancing his salary $1000 per annum.

Deaths in 1893.

Quite a number of men of prominence in the stove trade died in 1893. The list is headed by James B. Taplin, president of Taplin, Rice & Co. of Akron, Ohio, who died in January in his eighty-first year.

In February Thomas A. Westcott of Boston followed, aged 70, and actively engaged in the stove business until the day of his death.

In April Merritt Peckham passed away at Utica, N. Y., aged 80. He had retired from active business a few years before, but continued to give his firm the benefit of his advice.

During the same month Major M. P. Low of New York also died, aged 78. All these were veterans who had reached or passed the allotted three score and ten.

In May one of the younger generation of stove men died at Detroit, Patrick G. Breen, aged but 43. Mr. Breen had advanced from the molding floor in the Detroit Stove Works to a managing position in the Michigan Stove Company, and in 1889 secured an interest in the Peninsular Stove Company and became superintendent of the manufacturing department.

During the same month James Jones died at Utica, N. Y., aged 69. He was superintendent and one of the directors of the Carton Furnace Company, which he had helped to organize.

In June, at Troy, N. Y., James Morrison died, aged 81. Although not connected with the stove trade in his later years, Mr. Morrison was at one time a very prominent stove manufacturer.

J. M. Thatcher, inventor of the Thatcher furnace, died at Franklin, N. J., on July 19, aged 75.

At Cincinnati, on September 1, occurred the death of John Van, the inventor of the wrought iron range, who was upward of 80.

In the same month J. H. Beach died at New York in the sixty-fifth year of his age. He was one of the founders of

the Bridge & Beach Mfg. Company of St. Louis.

Henry C. Burgie, who had retired from the stove business but a year, died at Chicago in October, aged 63.

Also in October died John P. Barstow of Norwich, Conn., aged 71. He had been in the stove business since 1844.

In November, at Quincy, Ill., William V. Channon died, aged 81. Mr. Channon was president of the Channon-Emery Stove Company and had resided in Quincy for 45 years.

In the same month occurred the death of Edward D. Ransom of Albany, N. Y., aged but 42. He had been prominent as a stove manufacturer for a number of years, but latterly had been engaged in the foundry facing and supply business.

In December, at Milwaukee, Fred. G. Brand, secretary of the Brand Stove Company, died at the early age of 34 years, having been an invalid for many months, seeking health in vain in milder climates.

On May 12, Col. Augustus S. Bement died. He was of the firm of E. Bement & Son, Lansing, Mich.

In November Sylvester P. Pierce died, who was president of the Pierce, Butler & Pierce Mfg. Company of Syracuse, N. Y.

Reports from the Trade.

We have received many reports from stove makers in various parts of the country. From these letters we make the following brief notes on the condition of trade in the different sections, and add a few extracts from some of the communications :

The New England Section.

The stove manufacturers in the New England States report for the past year, as compared with 1892, a decreased volume of business, ranging from 5 per cent. In nearly every instance the cause of the falling off in sales is attributed to the financial depression and the agitation of the tariff question. The outlook for the new year is regarded as uncertain and the volume of business likely to show a heavy shrinkage.

A well informed stove man, commenting on the situation, says:

We have now become pretty well accustomed to hard times, and while we do not look very hopefully on the immediate future of our business, we propose to go on living happily, making the best we can of the times as we find them. We doubtless did our full share of worrying and fretting during the summer months.

Another manufacturer in summing up the situation considers that he gained during the past year as many new customers as he lost old ones. Yet notwithstanding this the volume of his trade fell off about 20 per cent.

The Middle Section.

Moving westward and taking up the reports covering New York, New Jersey, Pennsylvania, Delaware and Maryland, very much the same conditions as above described are found to have existed during the past year. Manufacturers report a shrinkage in the volume of business and the outlook discouraging and unsatisfactory, although an occasional instance is found in which the writer considers the prospects favorable for as much business this year as was enjoyed in 1893. In a majority of cases new goods were brought out, improvements in plant made and extra efforts put forth to meet competition and secure a fair share of business. A prominent manufacturing concern in Western Pennsylvania states that their business made a more favorable showing than would otherwise have been the case by reason of the addition of a furnace department to their plant. Another Pennsylvania manufacturer writes with regard to the prospects for 1894 as follows:

If stock in dealers' hands is to be considered solely, we should judge the coming year to be a promising one, but we think the general trade condition of the country will be an important factor.

The Western Section.

In the States west of Pennsylvania and north of the Ohio River, manufacturers report a shrinkage in the volume of business as compared with 1892 averaging about 10 per cent. In some instances the same amount of sales were made, in others it is said that up to July 1 the volume of trade was about 25 per cent. in excess of the previous year, while for the last six months there was a falling off of about 35 per cent. as compared with the corresponding period of '92. One of the most gratifying reports is that in which a manufacturing concern reports an increase of from 34 to 36 per cent. as compared with the previous year. Still another stove maker states that the year 1893 was the best in the history of the company. In all cases competition has been keen, and the margin of profit slightly less than the year before. A prominent concern in Ohio, in speaking of competition in their line, writes as follows:

Competition in its true meaning has had less effect upon us this year than for any year since we have been in business. This, we presume, was brought about by reason of the shortage of goods caused by the complete stoppage of many foundries during the late stringency. Proportionately the margin of profit is no less than last year, and we are inclined to believe that after all accounts for the year have been cast up, we will be more than pleased with the result in this respect.

With regard to the prospects for 1894, the impression seems to prevail that the outlook is anything but satisfactory, much depending upon the length of the discussion of vital questions by Congress, and upon results there accomplished. Generally speaking, the prospects are not very bright for the early months of the new year, although now and then a manufacturer is found who regards the future without fear, so far as the volume of his trade is concerned. One of the leading Ohio concerns, speaking on this point, says:

Looking at it from our standpoint we see nothing discouraging provided Congress acts promptly on the Wilson bill. Dilly-dallying with it will have the same effect as did their childish treatment of the silver bill—namely, keep the people in suspense. Give the people a base from which to work and they will forge out their own salvation.

With regard to the effect upon their business of the enactment of the so-called Wilson tariff bill in its present shape, the same concern say :

So far as it would directly affect us we do not fear it; while we are certain its effects would not enhance results if it dealt with us only, yet we believe it would not injure us. We believe, however, it will seriously affect the business of the country as a whole, and as we are fully dependent upon the prosperity of the whole country it would, of course, affect us through that channel. This is our opinion based upon a bird's-eye view of the past eight months. The shutting down of the woolen mills, iron furnaces, steel mills and a host of other industries, throwing out of employment a large number of people of a class who spend money freely when they have it, is bound to affect us in time. These things have actually taken place, and we believe all because of that plank in the Democratic platform declaring for a change in one respect of the revenue system of this country, and until something is definitely done with that proposed change we can look for no improvement.

A prominent stove manufacturer in one of the large Northwestern cities, in writing of the effect upon his business of the tariff discussion, says:

Our business is little affected by the Wilson tariff bill, because few stoves are imported into this country. Indirectly, however, we expect to suffer like every other industry by lower wages ruling, which, necessarily, must reduce the purchasing power of the laboring element and others. The panicky condition of the money market and the tinkering of the tariff cause stagnation and gloomy prospects for the future. We were obliged to shut down six weeks during the summer, which never occurred before during the 25 years of our existence.

Another prominent stove man in the same section of the country says:

In my opinion, the effect upon business of the discussion of the tariff question is very disastrous, as no one seems to know what to do or what position to take. The Wilson bill in its original form would, in my opinion, seriously injure our business, for the reason that it would cripple the general prosperity of the country. Of course we would not be afraid of direct competition in the stove trade from abroad, but unless the country is reasonably prosperous we cannot expect to sell as many goods as we have in the past.

Still another concern doing business in one of the Northwestern cities wiites as follows:

Through the Northwestern States business cannot be good this year, as the past 12 months have been a very hard year with them, and it will take at

least one year and good crops to recover from the present depression.

Speaking of the effect upon business of the tariff discussion the writer says:

The business of the country is in a very depressed condition. The patient is very sick, but as he has a good, strong constitution he will surely recover if let alone. Rest is what the country needs, not legislation. Congress should let the tariff alone, as its discussion unsettles and disturbs all branches of business, and no new enterprises will be launched so long as it continues. Such a measure is far too great and weighty for it to understand.

The Southern Section.

Throughout the South the business depression appears, from the reports at hand, to have been less manifest than in other sections to which brief reference has been made. In many instances stove manufacturers report about the same volume of business as during '92, the extremes ranging from 33⅓ per cent. less, which occurs in one case only, to 36 per cent. increase. In one instance a prominent manufacturer in a leading city of the South states that the volume of business for 1893 compared favorably with that of the previous year, which, however, was not the best ever enjoyed. In another case the manufacturer states that the volume of business was about the same, for the reason that facilities were increased and added efforts made to effect sales.

Competition was sharper than before, with a tendency in some sections to increase business at the expense of prices. This, of course, was not without its effect upon the margin of profit, and most manufacturers report a slight decrease in this respect.

The outlook for the future is not altogether encouraging, although stocks in the hands of dealers are light and any improvement at all in the general situation is likely to make itself quickly manifest in the stove trade. According to a leading manufacturer in Tennessee:

The disposition on the part of all is to "pull for the shore." That 1894 will be a dull, poor year for business is now generally conceded.

In writing of the effect upon business of the extreme depression which has prevailed, the manufacturer reported above says:

Payments have been delayed, business generally curtailed and failures and compromises increased. The effect of the tariff agitation is to delay everything.

Another concern doing business in Kentucky says, regarding the discussion of the tariff question:

It is a very disturbing element. We think if Congress would act quickly and settle the question, it would result in the starting up of many manufacturing concerns and business would at once improve.

A Virginia manufacturer writes as follows:

We cannot say that we have felt the financial stringency, as we have sold as many goods as in average years. With the exception of the time when the Senate was in session, collections were as good as usual. During the whole time, however, we did not have to borrow any money, so had only our fears to hamper us—no actual ghost coming near us. We do not see that the discussion of the tariff question has had any effect as yet in our special line, or if it does, the necessities of those needing stoves will overcome their theories on the tariff.

The Gasoline Stove Trade.

This year will be the fifth season for the new process gasoline stove. This stove was first tested by consumers in 1890, and met with immediate favor. There was much skepticism at that time among manufacturers of the old style generator stoves, who considered the new candidate for honors as a short lived weakling who might command some trade for a year or two on account of novelty, and would then gently fade and pass into oblivion. The new comer has, however, not only survived the perils of its first and second seasons but has made steady progress in supplanting the old system. It is estimated that about two-thirds of all the gasoline stoves sold in 1893 were new process stoves, and next year the proportion promises to be still greater, as all the manufacturers are bestowing most of their energy on new process goods. They are not neglecting the generator stoves, and continue to make improvements in that line so as to hold their trade at all points, but their greatest efforts are being made in their new process styles.

The results of the coming year are being awaited with a great deal of interest and some anxiety. While the stove trade, to a very great extent, moves in an orbit of its own, and is not usually much affected by prosperity or adversity in other branches of business, yet the depression in business now prevailing is of such an unusual character and so much more severe than any known for many years that the stove trade can hardly expect to escape from sympathetic influences which may restrict sales. It is true that in times of great prosperity stoves are not bought more freely, but only to meet the family necessity, and the argument may be made that necessities have to be provided for even when times are bad, but when rigid economy in domestic expenditures must be enforced it is surprising how the consumption of the greatest necessities can be curtailed. Still, it must be borne in mind that the largest part of the gasoline stove trade is done in rural communities either among farmers or those whose business is interwoven with that of farmers, and they are not so seriously affected by the business depression as manufacturing and commercial interests. Another point to be considered this year is the durability of the new process stoves, which have now been used long enough to be fairly tested. It is expected by some manufacturers that this year may develop a very great demand for repairs to the new process stoves sold in the years from 1890 to 1892, and if such repairs are of a more serious character than for the old style generator stoves a reaction in favor of the latter might be looked for.

This contingency, however, will be met by the manufacturers with the evidence in the later constructions that weak points have been strengthened and greater durability insured. Whatever defects may have existed in the earlier stoves have all been corrected as they developed, and the new process stove of to-day is as thoroughly reliable an apparatus as the generator stove had become when its rival sprang into existence. The further fact has also been demonstrated in favor of the new process stove that, in case a poor quality of gasoline is furnished by a dealer, the new process stove will continue to work with fair satisfaction under conditions which would cause and old style generator stove to clog up and almost, if not entirely, cease to operate.

It is noteworthy in this connection that very few changes have been made in the new process stoves since they were first brought out. The principle has not been modified in any important particular. Changes have been made in the construction of parts of the apparatus, to insure greater durability, as mentioned above, but the new process stove of 1890 looks very much like the new process stove which is now being made for the season of 1894. It was not the case with the old style generator stove, in which modifications were being constantly made and new patterns were brought out almost as regularly as the season changed. It is not often that a new idea, such as that of the new process stove, is brought forth in such well conceived shape that it is retained by a variety of manufacturers, all of them ingenious and all of them ready to seize with alacrity any improvement on the methods of their competitors.

Oil, Gas and Vapor Goods.

The volume of trade in oil, gas and vapor goods during the year just closed showed a gratifying increase as compared with 1892. This was in a large measure due, no doubt, to the growing popularity of gas and vapor stoves, especially during the summer months, and to the fact that in many instances where once introduced the cooking stoves were continued in use the entire year. This state of affairs was not without its effect upon the business in stoves using coal as a fuel. Reports from those engaged in the manufacture of oil, gas and vapor goods indicate a satisfactory business, all things consid-

ered, with sales in some cases reaching higher figures than for any corresponding year since the business of the concern reporting was established. Competition has been keen, with the result that the margin of profit has been somewhat less than during 1892, although among the concerns belonging to the Vapor Stove Association prices and discounts have remained about as heretofore.

Almost without exception the outlook for the new year is regarded by the manufacturers as uncertain and far from satisfactory. The general impression seems to be that the volume of business will be lighter during '94 than it was in '93, although now and then one is found who regards the prospects for the future as fairly encouraging. The depression existing in financial and industrial circles has had more or less effect upon the oil, gas and vapor stove trade, but the falling off in business has varied greatly with different concerns. In some instances the financial stringency appears to have caused no loss in the volume of trade, while in others the reduction, as compared with the first six months of the year, has ranged from 25 to 50 per cent. The tariff question is regarded as a disturbing element in the business situation, and until it is settled and confidence restored no marked improvement is expected.

Miscellaneous.

With regard to the trade in stove patterns, trimmings, repairs, stove polish, grates, mantels, &c., there is very little to be said which is not covered in the reports already presented. The same influences which affect stove manufacturers have a bearing upon those who furnish supplies, fittings, &c., and while the volume of business reported for '93 shows a falling off as compared the previous 12 months, the outlook in many instances is regarded as good, more especially in the stove repair line. This is explained by the fact that people are repairing stoves instead of purchasing new ones, and that as it will take several months, if not a year, to completely restore confidence, people will continue the plan of making their old stoves answer by putting in repairs rather than buy new goods. It is for this reason that stove repair men look for a larger trade this year than last. A prominent manufacturer of stove trimmings in the Eastern section of the country states with regard to the effect of the financial stringency that it was not injurious to his business. "On the contrary," he says, "it helped me. It was necessary, however, to work hard to keep up with orders and make prompt shipments. Slight losses were incurred through failures, but they were not important."

A maker of patterns for castings writes as follows: "With regard to the effect upon business of the passage of the so-called Wilson tariff bill in its present shape: In our opinion it would close up all stove manufacturers except those making first class specialties."

Another pattern maker expresses himself as follows:

I believe the prosperity of other nations benefits the United States, from the fact that we have the natural resources from which wealth comes, and as compared with other nations we would be prosperous in proportion to our natural resources.

ODD PLATES.

The Leibrandt & McDowell Stove Company, Philadelphia, have just set up the first stove from a new set of patterns, which not only pleases the eye but presents some attractive constructive features. The Stratford is an open stove that may well be called elegant. It has their new patent telescoping draft slide, and an ornamental cast iron curtain serves as a blower. This curtain is made in two parts and can be adjusted at any point desired to get the necessary heat and draft. The fire rests in a brick lined sheet iron niche and is agitated by a special arrangement of a simple bar grate. Air is taken from the floor underneath the stove and warmed by passing up between the inner and outer shells, and may be used for heating an upper room by means of a pipe. The Stratford is also made for use as a fire place heater and is adapted for different fuels.

The Albany stove foundries are busily engaged in taking inventories and making annual repairs. They hope to resume operations in a few weeks.

The Somerset Stove Foundry Company of Somerset, Mass., are distributing to their friends in the trade a very pretty calendar for the new year. It is lithographed in colors and arranged with a metal eye for hanging it upon the wall. Across the top of the card is the name and address of the company, with an indication of the line of goods manufactured; while at the bottom are attached the leaves for the different months of the year. In addition to the usual statistics the phases of the moon are presented.

Lewis Moore, secretary of the Joliet Stove Works, Joliet, Ill., has, by order of the Board of Directors, issued a notice to the effect that a special meeting of the stockholders of the company will be held on January 15 for the purpose of increasing the capital stock to $100,000, amending the by-laws and considering any other business which may come before the meeting.

Rathbone, Sard & Co. recently received at their Chicago office a letter from a customer in Minnesota, relating his experience with a stove purchased from them not long since. Wood was the fuel used by the purchaser of the stove, and one morning at 9 o'clock he filled the fire box with willow, which is said to have kept the fire for 27 hours. Any one who has had experience with burning soft wood will readily understand the difficulty of holding a fire for any length of time, and the record which has been made with the Acorn Radiator is a testimonial which cannot fail to interest the trade.

A charter was issued last week from the office of the Secretary of State to the Weir Stove Company of Taunton, Mass., the capital stock being $120,000. The officers include William E. Walker, president, and Charles E. Baker, treasurer.

The Somerset Stove Foundry Company, Somerset, Mass., send us a very pretty poster, lithographed in colors, and calling attention to the Somerset ranges, which include among others the Somerset Grand, the Somerset Jewel, the New Grecian, the Somerset Grecian, the Matron and Wyoming. Among the parlors we notice the New Somerset, Arion and Leo. We also have from the company a circular illustrating the Somerset Jewel, which is a substantial six-hole construction of attractive decoration. The company state that it is made from the best material and embodies the modern improvements.

The directors of the Auburn Stove Foundry, Auburn, Maine, have decided to repair the buildings recently burned and resume the manufacture of stoves as soon as circumstances will permit.

Joseph Huse & Son of 95-97 Blackstone street, Boston, Mass., are distributing, with the compliments of the season, a rather unique calendar for the year 1894. Attached to the upper left hand corner of a piece of heavy cardboard having beveled edges and measuring about 3 x 4 inches is a bag of dates, the contents of the bag consisting of chocolate colored slips of paper carrying the days of the week and months of the year. The lower part of the card is embellished with the statement that the firm were established in 1839 and are headquarters for range, stove and furnace repairs, as well as stove dealers' sundries. The calendar is sent out "as a reminder that if every day orders, however small, were given to the sender, mutual happiness and good feeling would exist not only at this present season, but throughout the entire year."

Century Stove Company, Dighton, Mass., are sending out a calendar attached to an engraving representing a horse's head, above which appear the words, "Always ahead!"

The Thatcher Furnace Company, of 33 Peck slip, New York City, and with foundry at Newark, N. J., report an increasing demand for their specialties and state that the business of the past year was far ahead of any corresponding period in their history. This is particularly gratifying, considering the many complaints of hard times and the general business depression existing in all sections of the country. The company have just brought out and put on the market a handsome double oven range, which is made in portable form and for brick setting.

The Chicago & Erie Stove Company of Erie, Pa., have always felt that they were an old concern, because, with their predecessors, they have been making stoves for more than 50 years. They have, however, recently received a letter from a customer in Lancaster, Pa., and representing a firm who have been in the hardware business for 130 years, and in that time have sold thousands of different kinds of stoves. In the letter to the company is the following statement, which must prove very gratifying to the manufacturers: "We feel secure in stating that never in the history of our business have we sold a range which is as near perfection as the Superb Helper. We have never had any difficulty in effecting a sale when we have shown this range to the best

class of people—those who want the best in the market. We have placed a number of them in this city and have heard nothing from their owners but words of praise. They all say its chief point of excellence is its asbestos lined, easily heated oven, which gives it auch excellent baking qualities and makes it a great fuel saver. Its strong duplex grates also strike buyera as a great point of merit." In having the patronage of the oldeat hardware house in America on first-class gooda, the Chicago & Erie Stove Company feel greatly encouraged and consider their efforts have been appreciated by the trade.

E. D. PURVES, repreaenting Southard, Robertson & Co. of this city, will call on the trade in New York and vicinity during the year. Mr. Purves is an energetic young man, and no doubt will meet with that succeas that accompanies pusb.

THE MATTHEWS MFG. COMPANY of Worcester, Mass., Ambrose T. Matthews, manager, have issued a new catalogue of the line of atove knobs, hinge pins, ateam pipe collars, ferrules, bicycle parts and sheet metal specialties, which they make in great variety. The gooda are shown by means of outline engravings, and in connection with each is given its number, size and price. Henry Gleason of 106 Beekman street, New York, is selling agent for the atove ornament department.

A CONVENIENCE that will be appreciated by merchants is a neat gummed label for marking goods with coat price and selling price which is being distributed by the Michigan Stove Company. The label is 1¼ x 1¾ inches, printed in brown ink and bears the Garland trade-mark at the top, while blank spaces for pricing are at the bottom.

G. M. SOVERHILL of Buffalo, N. Y., formerly connected with the Detroit Stove Works, will look after the interesta of the Danville Stove & Mfg. Company of Danville, Pa., in Western New York, Central New York and Northwestern Pennsylvania for 1894.

THE INDIANA STOVE WORKS, Evansville, Ind., will be represented by the following salesmen during 1894: W. H. Brumecke, Illinois, Southeastern Missouri and Arkansas; F. O. Headley, Missouri, Kansas and Oklahoma; W. F. Kargas, Iowa, Wisconsin and Minnesota; A. J. Schulz, Indiana and Nebraska; E C. Specht, Mississippi and Louisiana; J. C. Gorham, Texas.

Some Remarks on the Past and Future of the Stove Trade.

BY JEEMS.

"Man and boy, nigh on 50 year I've been in this atove business, and I think this is the worat year I ever saw. There have been no goods sold to apeak of, and what you did aell you couldn't get any money for, and I swan to man if they don't want you to give 'em the earth if they do buy anything. I am just sick of the whole thing, and I am going to do aomething else, sure as you're born, honey, and I ain't going to fool my time with thia cussed business any more after thia year."

This is what "ould Tim," our foreman, said as he came out of the store back in the shop and flung his apron on the bench a few nights ago. Tim generally tends atore when the old man goes out to supper, and a mighty good man he is. All the old timers like Tim, but he is a terror to their hopefuls if he don't feel good when they come in the shop for anything.

He knew them when they were "suckers," he says, "and they can't give me any back talk." But when Tim's fur lies straight he is very good company, and the youngsters crack jokes and lark with him to their hearts' content. But the fact is Tim is getting old, and, like many others, he lives too much in the past. The newness of the new has no interest for him. He has got the same old snip of a looking glass tacked up in the shop that he has used for the last 40 years, and I'll be hanged if I don't believe he has the same old towel that he hung up when he tacked up the glass.

Even the soap has an aged and hardened look. Tim was good-looking in his younger days, and he spruces up quite a bit now, and the "jours" often catch "ould Tim" interviewing his phiz in the mirror. He don't admit much about being old, but he is. The real fact is Tim is so well up in the history of the past that I am durned if I believe he thinks there is to be any future. You can hardly bring anything up but what Tim chimes in "that puts me in mind," and away he alides down hill and gets down to the "fall of '49 or the spring of '50," or perhaps "'32 cholera," when he worked for old Cunningham down in Water street. The cholera got so bad that he went to work for a farmer out at Cow Bay, L. I., who fed him bony fish and horae feet until he thought cholera would be a luxury.

So while Tim is a good fellow he is getting to be a durned old bore, with his headstrong "what we used to do," &c.

But Tim was not what I wanted to get at; it was the stove business. But it doea seem that there is always something interfering with the running of the busineas.

The atove business in the East has not been very satisfactory, either for manufacturera or dealera, although many have had their usual trade. Of course, all sorts of reasons are assigned for its shortcominga by dealers and makers. So far aa the general business of the country is concerned the press furnishes the reasons, or at least attempts to supply them, for all its failures last year, and the public at large accept them and quote them as the cause of all their woes. As a majority of the press are more or less partisan, partisan reasoning furniahes many more alleged causes of trouble than possibly a truthful and honest analysis of the situation would bring forth.

There is another thing to be considered about the stove trade. The increased use of steam, hot water and hot air furnaces, gas, oil and vapor stoves would seem to make it desirable to bring or put each style of goods under its appropriate heading and sum up each class by itself as to its doings.

The term "atove trade" is too general to cover the busineas now, and to say that the atove business is good, or not good, does not meet the aituation. If we take all the preceding goods under the head of stove trade we would possibly find that the trade for 1893 had been greater than ever—that is, more goods went into consumption—but posaibly fewer stoves were sold—at least, in the East. So far as the stove trade proper is concerned it has been as good as it could be—that is, the warm weather has been its greatest drawback, and all the cry of hard times, silver bill, tariff, &c., has had but a limited effect upon it. All those people who depend upon stoves strictly for heating and cooking have been favored up to date with moderate weather, and if economy was needed it could be easily practiced, but severe weather would have changed matters, and the atove trade would have showed its full consumption.

The branches of the atove trade enumerated before are steadily growing and increasing, and the plants, capital and volume of trade used in them are rapidly gaining on the atove trade proper. Putting all these divisions of heating and cooking under the head of atove trade, it will be found that its aales are increasing largely each year, and it doea not and will not go backward. But it will be a good deal like yachting was laat season: there were lots of fast boats up to the "Vigilant's" time, but they weren't in it and never will be again. So it is with the atove trade; it isn't what it used to be, and only the progressive "Vigilants" will find it fine sailing, and no doubt 1894 will develop plenty of new and startling departurea in the heating and cooking line, both in goods and methods of marketing them. There are lots of "Ould Tims" who do not realize where the stove business is; of course I mean the whole kingdom of heating and cooking apparatus. They know what it used to be, but they think it has gone to the dogs.

There is no such thing as the United States going backward. Perhaps it will be found that 1893 was a alow down to clean up and key up the machinery preparatory to running the machine on a acale that we have never yet seen. "This place never closed" may be observed placarded on many places, and plenty of other buainesses are never closed. The greatest era of proaperity the United States has ever known is coming and we are getting the machinery in bang up condition preparatory to "never closing." Don't aqueal if the past has not favored you; let it go, forget about it, and look to the front for the good things to come. You won't find them in the ash heap of the past.

TRADE REPORT.

The Iron Market.

The year 1893, just closed, will pass into history as the most disastrous that the great Iron industry has ever experienced. The misfortune is that its closing week has passed with even deeper gloom than any of the whole of 1893, and that as yet there are no signs which can inspire sellers with confidence or cause buyers to waver in the conviction that their next contract will be closed at better terms than they have yet secured. When buyers are told by the largest manufacturer in the country that they need only make their own terms to secure material it will take startling developments against them to put them in a frame of mind which will make advances possible.

The demands for a readjustment of prices on old contracts to conform to values actually ruling at time of delivery have been numerous enough without offering additional temptations to buyers to multiply them. The flexibility of contracts in this respect has been appalling, but in their helpless condition manufacturers have found it practically impossible to resist such unfair demands.

Transactions during the week under review have not been numerous. One of the most encouraging reports is that foreign interests have taken further quantities of Southern warrants, of which they are estimated to hold now about 35,000 tons. While, of course, this Iron may have a checking effect upon any rapid rise when it does come, the fact that it has been purchased proves that at last somebody has faith in the statement that bottom has been reached.

The following review of the Eastern Iron trade, furnished by our Philadelphia representative, affords an excellent summary of the general conditions prevailing in the Iron markets of the country in 1893 :

The year 1893 will be long remembered as the worst which has ever been experienced by manufacturers of Iron and Steel. The opening of the year was not such as to give great hopes in regard to the business outlook, neither was there anything to indicate the extraordinary collapse which set in during the summer months. The fact that important orders were pending from the shipyards and other large consumers, kept things in fairly good shape for a few weeks, but when something like 50,000 tons of Plates and Shapes were placed at figures which up to that date were unknown, the entire market commenced to show signs of weakness. From that date to the present—nearly a year—there has been practically nothing but a continual chipping away, and prices to-day are not only without precedent, but are lower than the most pronounced pessimist would have thought possible. Some decline has been met with in Pig Iron, $1.50 to $2 ℔ ton; some also in Billets, $5 to $6 ℔ ton, but in Finished Material it is difficult to say what the decline is, except that it is fully $10 on the lower grades, and probably $15 to $20 on the higher qualities; but there is no price to anything to-day, so that comparisons can only be made in general terms. Early in the year confidence received a severe blow by the suspension of payments by the Pottstown Iron Company, the Pennsylvania Steel Company, the Maryland Steel Company, the Reading Rolling Mill Company, the Philadelphia Bridge Works, and still later by the Wellman Iron & Steel Company. Receiverships for the Reading and Northern Pacific Railroad companies also had a depressing influence, so that from January 1 to December 30 there was one continuous line of disaster. With such a record for 1893 it is surely not unreasonable to expect a decided improvement during 1894. At the moment there are no indications of a turn in the tide. In some respects the outlook is the reverse of encouraging, though there is a general belief that some time during 1894 business will assume its normal condition, but it is not in sight yet.

Pig Iron.—The market for Pig Iron has been steadier than might be supposed considering the extreme fluctuations in other material. One reason, perhaps, is that Pig Iron led the way in the decline during the previous year and had gone so far that there was very little room for further reductions. Eastern prices have been more uniform than those in the West, partly because no Bessemer of any account has been made here of late months and partly because furnaces running on foundry and mill Irons decreased their output in anticipation of less favorable conditions. The result has been a decline averaging not more than $2 ℔ ton, and in some cases less than that. At the same time it will be noted that Pig Iron is at the lowest figures ever recorded, and lower perhaps than it can be produced for, except in a few isolated cases. There is nothing in the situation lately to cause any material change from present conditions. Those who have followed the monthly statements of furnaces in blast will see that production is a little over 90,000 tons per week, against something over 170,000 a year ago. This indicates an average reduction in the volume of business of 40 % compared with that during the early portion of 1893. The decrease in production of the furnaces west of the Alleghanies is about 49 %, and of those East a trifle less than 52 %, showing that the East is doing less in proportion than those in the West. The supply of Pig Metal is ample for all requirements, however, and unless there is some improvement in demand stocks will again begin to accumulate. Consumers show no disposition to place orders, however, and while they could engage deliveries for 60 or 90 days to come at as low or lower figures than ever before, they appear to be quite indifferent and take only such quantities as they need to cover present necessities. Prices vary according to circumstances, but ordinarily seaboard deliveries are about $12, $13 and $14 for the three leading grades and $11 @ $11.25 for an ordinary quality, but the market is unsettled and quotations subject to modification, according to quantity, brand, delivery, terms of settlement, &c.

In the Chicago market contracts have been placed for several round lots of local Coke Iron for delivery running through the first six months of this year. Special terms are usual on transactions of this character and low prices must be made now to meet the views of buyers to induce them to cover their requirements so far into the future. Southern sellers report a very small trade with prices comparatively firm on No. 3 Foundry and No. 2 soft, of which stocks have been pretty well cleaned up, but on other grades there is considerable pressure to sell. Freight rates from the South will be advanced 20¢ ℔ ton on January 15. Lake Superior Charcoal is very quiet, with no sales reported now in small lots. Quotations are now as follows for cash:

Lake Superior Charcoal.....	$15.50 @	$16.00
Local Coke Foundry, No. 1...	13.00 @	13.50
Local Coke Foundry, No. 2...	12.50 @	12.75
Local Coke Foundry, No. 3...	12.00 @	12.50
Local Scotch.....	13.50 @	14.00
Ohio Strong Softeners No. 1..	15.50 @	16.00
Southern Silvery, No. 1.	.....@	13.75
Southern Silvery, No. 2.....	.....@	13.25
Southern Coke, No. 2..... ...	11.90 @	12.15
Southern Coke, No. 3.....	11.40 @	11.65
Southern, No. 1, Soft.....	12.15@	12.40
Southern, No. 2, Soft.....	11.40 @	11.65
Tennessee Charcoal, No. 1...	16.00 @	16.50
Tennessee Charcoal, No. 2....	.....@	15.00
Southern Gray Forge.....	10.60 @	10.85
Alabama Car Wheel.....	18.00 @	18.50
Jackson County Silvery.....	16.00 @	16.50
Other Ohio Silvery.....	15.00 @	15.50

The following table has been prepared, averaged monthly from our weekly quotations, showing the range of prices at Chicago on leading brands of Pig Iron during the year. This table, however, is less accurate than for previous years, as it does not reflect the transactions known to have been made at cut prices when the condition of business was most demoralized. No. 1 local Coke, having been in but moderate supply during the year, was conspicuously firm. The sharpest competition occurred on Nos. 2 and 3, especially when sellers entered a contest for desirable orders with Southern makers. Some brands of Ohio Soft-eners were also sold considerably under regular quotations. Following is the table:

Months.	Local coke No. 1.	Lake Superior charcoal.	Ohio strong soft, No. 1.	Southern coke, No. 2.
January	$14.00	$16.50	$16.50	$13.75
February	13.75	16.50	16.50	13.50
March	13.50	16.50	16.25	13.25
April	14.00	16.50	16.25	13.00
May	14.00	16.50	16.25	13.00
June	14.00	16.00	16.25	12.75
July	13.50	16.00	16.00	12.75
August	13.50	16.00	16.00	12.75
September	13.50	16.00	15.75	12.50
October	13.50	16.00	15.75	12.50
November	13.50	15.75	15.75	12.25
December	13.50	15.50	15.75	11.75
Av'ge for year..	13.75	16.12½	16.00	12.75
Av'ge for 1892. .	14.50	16.75	16.75	14.00
Av'ge for 1891...	15.50	17.37½	18 00	15.00
Av'ge for 1890...	17.50	20.75	20.00	15.25
Av'ge for 1889...	16.75	19.37½	18.75	15.75

The last week of 1893 did not bring out any changes in the Pig Iron situation in the Pittsburgh district. Buying continues very light, prices are not strong and the market is weak. During the year there has been a decline of about $2 or $2.50 ℔ ton in Foundry Iron, and the demand for the last half of the year was considerably below that for the first half. With No. 1 Foundry at $11.75 @ $12, it hardly seems possible that values can go much lower, while if an improved demand should be met a slight recovery in prices early this year is believed to be not improbable.

There have been no favorable developments in the Southern markets for Pig Iron during the week. Of course, little business was expected during the holiday week, but such an utter absence of demand could hardly have been anticipated, for even the jobbing foundries in most districts have taken little individually and in the aggregate. The volume of business during the month of December was scarcely more than one-half as much as the corresponding month in 1892, and the outlook for January has few encouraging features. Buyers believe that they will lose nothing by waiting, and that the chances are strongly in their favor, but the stronger Southern Iron companies appear to have a considerable degree of confidence in the future. Quotations are as follows:

Southern Coke, No. 1	$11.75 @ $12.00
Southern Coke, No. 2	10.75 @ 11.00
Southern Coke, No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

The only news of interest in the New York market is the report that foreign interests have taken further quantities of Southern warrants, the amount involved being about 18,000 tons, which carries the total thus far contracted for by foreign parties to about 35,000 tons. It is understood that the prices were $7.50 in yard for No. 3 Foundry, and $8 for No. 2. We quote: Northern brands, $13.25 @ $14.25 for No. 1; $12.75 @ $13.50 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $13.50 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12 for No. 3; $11.50 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

Metal Market.

Pig Tin.—Business has been extremely quiet and the market remains bare of new feature aside from the change in the statistical position. In the latter connection the most remarkable fact is that the official estimate of consumption was reduced to 910 tons for the month of November, against previous estimates of 1600 tons monthly. The stock in the United States, excluding Pacific ports, is estimated at 1980 tons, and the amount afloat is 1005 tons. Prices have not fluctuated as much as the statistics, but the market shows rather poor form and it is no difficult matter to purchase ordinary jobbing parcels at about 20.60¢. Bids of over 20.50¢ for round lots have been extremely few and far between. Boustead & Co., Singapore, cabled Straits shipments during the last half of December as having been 2075 tons, making a total for the month of 3900 tons, against 2980 tons in December last year. Secretary Mayer of the New York Metal Exchange has compiled from official returns the following report showing the consumption of Tin in the United States during 1893:

"The official returns of the United States Bureau of Statistics give the following figures: Total importation of Tin into the United States from January 1 to July 1, 1893, the time when the import duty went into effect, 38,471,199 lb; of which were re-exported, 201,753 lb; leaving 38,269,446 lb; of which were imported into Pacific ports, 1,883,337 lb; leaving 36,386,109 lb; equal to 16,244 tons of 2240 lb for the United States, excluding the Pacific ports. Since the inauguration of the import duty the importation into the United States, excluding the Pacific ports, amounted to 746 tons, while the Pacific ports up to November 30, 1893, imported only 222 lb. According to these figures the consumption of the United States for the calendar year 1893 has been as follows: Stock January 1, 1893, 3500 tons; imports first six months of 1893, excluding Pacific ports, 16,244 tons; imports last six months of 1893, excluding Pacific ports, 746 tons; total 20,490 tons; stock in United States, January 1, 1894, excluding Pacific ports, 1980 tons; consumption, excluding Pacific ports, 18,510 tons; imports into Pacific ports taken as consumed there, 1,883,559 lb, equal to 841 tons; total, 19,351 tons foreign Tin consumed in the United States during the year ending December 31, 1893. The stock on January 1, 1894, of 1980 tons, as given above, includes 500 tons entered and still remaining in bonded warehouses. For the first time we are enabled to give the stock more nearly the actual figure than ever before. In our issue of August 8, 1893, we gave the consumption based on Government figures for the fiscal year ending June 30, 1893—viz., 21,053 tons; the calendar year shows only 19,351 tons. The apparent decrease of 1702 tons seems to be the result of the depressed state of business during the last six months."

The transactions in Tin on the Exchange during the year aggregated 20,405 tons, which is equal to about $10,000,000. During the same period there were 24,820 tons sold on the London market. The exports of Copper in 1893 amounted to 83,375 long tons.

Copper.—Business has been of strictly routine type and moderate all told. At least, such is the gist of reports made by sales agents and brokers. Such as they were, the dealings were chiefly at last week's prices, say 10¼¢ @ 10⅝¢ for Lake Superior Ingot, 9¾¢ @ 10¢ for Electrolytic and 9⅝¢ @ 9⅞¢ for casting stock, according to brand and quantity. Jobbing business during the week has continued to be on a very narrow scale. Quotations for small lots from store rule at 10½¢ @ 11¢ ℔ lb.

Sheet Copper.—There is but little movement in the trade at the present moment. Consumers are generally engaged in stocktaking and figuring out their future requirements. A week or two will probably develop more inquiry, but as building operations are at present very much restricted and as but little work in that line is in view during the immediate future—in the East at any rate—the prospects for any large business during the early part of the present year are very faint. A hand to mouth trade is all that is looked for.

Pig Lead.—Dealings have been on a very moderate scale and the demand fails as yet to show any signs of improvement. No particular pressure to sell is observed, but there seems to be quite enough Lead to go around, and prices remain soft at 3.25¢ @ 3 30¢ for ordinary Western brands. The consumptive demand is of the weakest, and prices are softer, 4¢ being the usual rate for small lots of Pig, while 3¾¢ has even been conceded by jobbers in some cases.

Lead Pipe and Sheet.—The apathy which has marked the Sheet and Pipe trade for several weeks gives no sign of coming to an end. Jobbers report that the demand is almost lifeless. Nor is any material revival looked for before the spring. Those in the trade who are best qualified to judge estimate the falling off in the volume of business during the past three months as being fully 40 %, as compared with the average for the present season. Collections are, nevertheless, reported as being unusually easy.

Spelter.—Sales here have been on a very moderate scale. The demand continues slow as well. Meanwhile the pressure to sell increases more or less and serves to keep prices on a very low level. Ordinary Western brands have been sold at as low as 3.55¢ @ 3 60¢, with an advance of 0.65¢ @ 0.70¢ ℔ lb on small jobbing quantities. Fancy brands bring about the usual premium.

Antimony.—There is a fair jobbing movement at about 9¼¢ @ 9½¢ for Hallett's and 10¢ @ 10¼¢ for Cookson's.

Tin Plates.—During the past week the demand for both prompt and future deliveries has continued rather disappointing, leaving the market in poor shape. Canners have mostly placed their orders for Cokes to cover their spring business, and some have anticipated their wants for as late as June and July. Such contracts have in all cases, however, contained a proviso in relation to possible tariff changes in the interval. Within the last day or two an increase in small orders, making the aggregate a fair amount, has been noticed by dealers in this city. These were probably held over by the smaller consumers until after the first of the year for financial reasons. The most satisfactory branch of the Tin Plate market is that of domestic Roofing Plates, which are in constant demand, so that there is no piling up of these products either at the works or in agents' hands. Stocks of imported Plates in New York are now fairly large, owing to the slack demand of the past few weeks, and the assortment good. Prices are somewhat soft and apt to be shaded on good offers.

A London cable dispatch to *The Iron Age* of January 3 reports the British Tin Plate market as being rather weaker. Inquiries have been rather more numerous, but buyers' views on prices were too low for the consummation of any considerable business. Stocks of Plates at shipping points are estimated at 252,000 boxes. Liverpool quotations are given as follows:

IC Charcoal, Alloway grade.....12/3 @ 12/9
IC Bessemer Steel, Coke finish. ...11/3 @ 11/6
IC Siemens " " " .....11/6 @ 11/9
IC Coke, B. V. grade, 14 x 20.....11/3 @ 11/6
Charcoal Terne, Dean grade.....10/9 @ 11/

Sheet Iron.—The demand for both Black and Galvanized Sheets has fallen to the lowest point during the past week. Such business as has passed was exclusively in the shape of small lots for immediate use. Jobbers' quotations for small lots of Black Iron, although remaining unchanged nominally, are usually shaded for prompt cash, while a more liberal discount is allowed on purchases of Galvanized Iron.

Financial.

The year of Our Lord 1893 has dropped into the past with a sufficiently heavy load of financial and commercial disaster to stamp it in future history as one of almost unequaled gloom, and the last week displayed no lifting of the strain. It passed out with a pre-eminent record of dullness and depression in business circles, with one of the largest returns of failures in the year, with the prices of staples at the lowest notch, with a further shrinkage in values of railroad and industrial securities approximating them to the phenomenal prices of August, with a growing army of unemployed labor whose ranks are swollen to unprecedented proportions, and with the operations of many industries reduced to as much as one-half their normal volume, and those of most restricted to a very material extent.

Beyond these unfavorable symptoms, a constant falling off in Treasury receipts is announced which presents a a very serious condition. The shrinkage for the last six months of 1893, according to official reports, reached a total of over $34,000,000, mainly composed of heavy decreases in customs receipts and to a lesser extent in internal revenue, while expenditures for the same period show a comparatively small decrease of $5,800,000. So far as can be foreseen there is no ground for assuming that there will be any material change in these proportions in the near future, and the total shrinkage in Treasury receipts for the present fiscal year is estimated as likely to reach between $50,000,000 and $60,000,000. To relieve this incubus will be the weighty task of the Administration during the present year. At the close of 1893 the Treasury cash balance had fallen to $89,000,000, of which $81,644,000 was gold, with the certainty of a further decline in the reserve during the coming months unless the Government shall succeed in raising money by the issue of bonds or by other means.

In a comprehensive summary of the business features of the past year *Dun's Review* presents some very striking statistics, showing the disastrous effects on general business of the financial report of 1893. The commercial and banking failures far surpassed those of any previous year, both in number and magnitude. Those included in the former class reached a total of 14,212, with liabilities amounting to $331,423,000, which may be tabulated under the leading interests as follows, the last three ciphers being omitted for convenience:

	Manufacturing.		Trading.		Others	
New England	482	$12,065	1,290	$14,820	24	$2,766
Middle	1,149	100,700	2,035	25,757	80	13,136
Southeastern	358	10,106	2,096	20,668	39	4,934
Southwestern	90	1,712	1,047	10,377	12	2,515
Central	664	28,138	1,387	19,681	55	6,451
West	219	7,075	1,656	19,479	51	15,429
Pacific	264	4,908	1,172	9,269	41	1,428
Aggregate	3,226	$164,707	10,683	$120,054	302	$46,659

The banking failures in 1893 were 642 in number, with liabilities of $211,000,000, and reported assets of $234,350,000. The following table shows their territorial distribution:

States.	No.	Assets.	Liabilities.
New England	16	$9,852,895	$12,546,000
Middle States.	35	41,460,089	43,478,618
Southeastern	82	29,111,842	22,119,514
Southwestern	61	26,254,154	29,703,776
Central	149	38,766,378	37,457,963
Western	218	57,264,427	39,554,298
Pacific	81	31,634,752	26,138,639
Total	642	$234,345,537	$210,998,808

The railroads suffered in proportion almost more seriously than any other business interest. No less than 75 roads, many of them of the first importance, worth about one-seventh of the total mileage of the United States, were placed in the hands of receivers. Their total indebtedness reached over $1,200,000,000, the amount of stocks outstanding being $674,412,487.

The uniform shrinkage in prices of staples has been most marked. Cotton, which on January 1, 1893, was at 9¼¢, ruled on January 1, 1894, at 7 13/16¢ ℔ lb. Wool between the same dates shrunk from 28¢ @ 29¢ to 23¢ @ 23½¢ ℔ lb. Wheat fell from 79¾¢ to 65⅞¢ ℔ bushel; and corn from 49¼¢ to 42½¢, the latter prices being those quoted on the first business day of this year. As the prices of agricultural products virtually determine the prices of all other products, it is small wonder that those for all manufactured articles were the lowest on record. Yet with all these and other unfavorable effects of the financial panic of 1893, the wonder is that the business and commercial community of the United States in general passed through the fierce trials of the past year without yet more extensive disaster.

A comparison of the business done on the New York Stock Exchange during the year 1893 with that of 1892, shows as follows:

Stocks, shares	80,013,902	Dec..	5,613,084
Bank stocks	9,458	Dec..	2,698
Mining stocks	252,172	Dec..	63,294
Railroad bonds	$351,415,250	Dec..	$131,735,250
State bonds	3,766,400	Dec..	1,313,900
Government bonds	1,914,200	Inc...	292,000

Chicago Report.

Scrap.—Old Material is extremely dull. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

In the Omaha *Sunday World Herald* of December 17 appears a paragraph in regard to an alleged infringement of the patent of Merchant & Co.'s Star Ventilator. It would seem that the Star Ventilator was specified for the Lincoln, Neb., Hospital for the Insane and that the contractor, E. Gurske, placed other Ventilators in the building, which Merchant & Co. claimed to be infringements on their Star patents. Steps were accordingly taken to stop payment on the work pending an investigation. The matter was duly laid before the State Board of Public Lands and Buildings, with the result that the board decided to withhold a settlement with the contractor until he had made a satisfactory settlement with Merchant & Co. We are informed that Merchant & Co. have recovered heavy damages in the case.

The advertisement elsewhere of Hodge Brothers, 13 Chardon street, Boston, Mass., is addressed to the Stove, Furnace, Boiler and Household Goods trades, and calls attention to articles that will be appreciated by them.

CONDITION OF THE

Hardware Trade.

THE PAST WEEK, broken as it was by a holiday and devoted principally to the closing up of the business of 1893, was characterized by exceptional quietness in trade, and it is as yet too early to look for any important change from the conditions under which the old year ended. The results of stock taking are not yet sufficiently ascertained to indicate precisely the results of the business of the year, but it is assumed on general principles that profits will in most cases be considerably less than usual. It is presumed that the stocks on hand with the trade are considerably smaller than usual, and notwithstanding the relatively light business of the past few months manufacturers also have on hand somewhat less than the usual quantity of goods. The market is thus in condition to feel quickly the effect of an active demand when it sets in. Prices are in an unsatisfactory condition. Leading lines of staple goods are cheaper than ever before in the history of the trade, but in the line of general and Shelf Hardware prices which held six months or a year ago are still quite generally adhered to. There are indications, however, of a tendency toward lower prices in some goods, and it is not unlikely that a careful review of costs, diminished in some cases by reduction in wages, will enable manufacturers to name lower prices on some lines. The condition of the market in some of the leading trade centers is reflected in the communications given below from our special correspondents, some of whose advices, owing to special circumstances, are deferred until our next issue.

Advices from Chicago.—The Hardware trade has not yet made a start for the year. Salesmen are generally at home and stock taking has not concluded. Jobbers are not expecting any business of consequence for the first two weeks of the month.

Advices from St. Louis. — The jobbers of Hardware have about concluded their annual stock taking, and most of them are more than satisfied with the year just closed, when it is taken into consideration that many concerns throughout the country who started out so encouragingly have dropped by the wayside. The city of St. Louis was singularly free from business embarassments and the jobbers have not very many bad debts to carry over. Careful conservative judgment has been displayed during the entire year, and they now face 1894 with the hope that it will prove a banner year. Traveling men will shortly leave for their accustomed territory, and business in this department is expected to pick up quite lively during the next month.

Notes on Prices.

THE PAST YEAR witnessed a decided decline in the price of both Wire and Cut Nails, the decline having been most marked in the latter half of the year, especially the months of October, November and December, when exceedingly low prices were developed.

Wire Nails.—In view of the moderate demand and their indisposition to accumulate stocks several of the mills are largely curtailing their production or stopping for a time. The market, on the whole, continues in the unsatisfactory condition referred to in our last report, prices being represented by the quotation of $1.10 for carload lots at mill. It is, however, understood that this price can be slightly shaded on attractive orders, but manufacturers are indisposed to make concessions, and are desirous of reaching some understanding by which prices may be put on a more satisfactory basis. They are also unwilling to accept large orders for future delivery at current prices, and are at the present time pursuing a waiting policy and watching the market closely for developments. The Wire Nail market opened in January, 1893, weak and somewhat irregular, $1.40 being the price for round lots at mill. This price had declined by December to $1.10, some large orders being even placed at $1.05. It will thus be seen that the decline in price during the year was exceedingly marked, lower figures having been developed than had previously been thought possible.

Advices from Chicago.—Wire Nail manufacturers report but a small inquiry during the past week, but the market has been disturbed to some extent by offers of Nails at very low prices for spot cash by manufacturers desirous to realize on accumulated stock. It is probable that some large buyers have in this way been able to secure cheap Nails, but it is extremely doubtful whether any very considerable quantity was thus disposed of. Quotations are made in a general way at $1.15 to $1.20 Chicago for factory lots. Small lots are selling from stock at $1.30 to $1.35.

Cut Nails.—The Cut Nail market is characterized by stagnation, there being but little business. The quotation of 90 cents for carload lots at mill still represents the market, but this price could doubtless be shaded on good orders with attractive terms of payment. Small lots from store in New York are quoted at $1.20 to $1.25. The course of the Cut Nail market during the past year was similar to that of Wire Nails, having been characterized by an unprecedented decline in prices. The course of things is represented in the following quotations, which give the price of carload lots at mill at the close of each of the months named:

March	$1.20
April	1.15

May	1.10
June	1.05
July	1.05
August	1.05
September	1.00
October	1.00
November	.95
December	.90

Advices from Chicago. — Cut Steel Nails are extremely quiet. Merchants are slow about making contracts for such Nails as they will require during the early months of this year, but manufacturers believe that in the course of two or three weeks there will be considerable business. Prices on ordinary specifications are maintained at $1.20, but there is a tendency in the trade to make concessions on high averages. Small lots from stock are selling at $1.25.

Barb Wire.—The Barb Wire market is inactive and prices are low and somewhat uneven. Galvanized Four Point is readily obtainable at $2.05 at mill, with 5 cents off in carload lots. Painted, at mill, is represented by the quotation of $1.65, with 5 cents off in carloads. Some manufacturers are, however, unwilling to meet these prices. During the greater part of the past year the Barb Wire market was comparatively even in the matter of prices, but the last few months developed considerable weakness, and prices fell off to the comparatively low figure at which they closed in December. The course of the market is indicated in the following quotations, which give the prices for Galvanized Four-Point Barb Wire, in carload lots at mill, at the close of the months named:

January	$2.40
February	2.40
March	2.45
April	2.45
May	2.45
June	2.45
July	2.45
August	2.45
September	2.35
October	2.25
November	2.15
December	2.10

Advices from Chicago.—The local trade in Barb Wire seems to be quiet and confined to small lots, which manufacturers are supplying at $2.30 to $2.35 for Galvanized. The Indian Territory is the seat of severe competition for business, which is presumed to be assisted by cut freight rates to prevail for a limited time. Jobbers quote $2.40 on small lots of Galvanized from stock.

Cordage.—The Cordage market continues to show a declining tendency, and Manila has been sold in large lots at 7 cents, f.o.b. factory or New York, subject to the usual discount of 1½ per cent. for cash. Sisal and New Zealand are held pretty firmly at 5 cents for similar lots and terms.

Specialties.— A. S. Henn & Co., New Haven, Conn., issue the following discount sheet relating to their catalogue of light Hardware specialties. Terms, cash 30 days, with a discount of 2 per cent. for cash in 10 days:

	Discount, per cent.
Can Openers	50 and 10
Mincing Knives	50 and 10
Pocket Wrench	50 and 10
Soldering Set	50 and 10
Towel Holders	50 and 10
Bird Cage Springs	10
Picture Hooks	10
Door Numbers	50 and 10
Clothes Line Pulley	50 and 10
Brass and Bronze Bolts	60 and 5
Iron Bolts	70 and 10
Common Cast Bolts	70 and 10
Letter Boxes	50 and 10

The following are the list prices of their Sardine Knives, Can Openers, Mincing Knives and Pocket Wrenches, which are subject, as above stated, to a discount of 50 and 10 per cent., with an additional 2 per cent. for cash in 10 days:

Sardine Knives (Heavy Casting).

	Per gross.
No. 10, Japanned, bright steel blade, riveted	$7.22
No. 015, Japanned, bright steel blade, with screw	7.78
No. 15, Japanned, polished head, with screw	9.44
No. 3, Polished and nickel plated, with screw	13.88

Sardine Knives (Light Casting).

No. 010, Japanned, bright steel blade, riveted	5.56
No. 010, Japanned, bright steel blade, with screw	6.10
No. 010, Polished and nickel plated, with screw	11.68

National Can Opener.

No. 5, Japanned, steel blade, cast in.	4.98
No. 5, Japanned, polished head	7.75
No. 5, Polished, nickel plated	11.20

American Can Opener.

No. 0, Bronzed, with steel blade, cast in	3.88
No. 0, Polished, fine nickel plated, cast in	8.44

Henn Can Opener.

No. 60, Imitation ebony handle, nickel plated	33.32
No. 65, Enameled handle, polished	28.80

Sprague Can Opener.

No. 1, Japanned iron handle	14.00
No. 2, Enameled handle	15.00

Perfect Can Opener.

No. 30, Extra polished and nickel plated, cherry wood handle	36.00
No. 25, Polished, with japanned handle	24.00

Fifth Avenue Can Opener.

No. 20, Full polished and nickel plated	24.00
No. 22, Fine polished head, japanned handle	20.00

Grand Can Opener.

No. 50, Full polished and nickel plated	30 00
No. 55, Fine polished head and japanned handle	24.00

New American Sharp Pointed Steel Blade.

No. 02, Bronzed, extra hardened and tempered blade	5.00
No. 2, Silvered, extra hardened and tempered blade	6.12
No. 2, Polished and fine nickel plated.	8.90

Mincing Knives.

No. 50, Japanned handle, polished steel blade	18.88
No. 60, Silvered, unfinished	21.12
No. 70, Polished and nickel plated in full	36.68

Bicycle Pocket Wrench.

No. 200, Bright rolled Wrench, cast nut	18.88
No. 210, Fine polished, knurled steel nut	26.68
No. 220, Fine nickel plated, knurled steel nut	35.56

Malleable Iron Pocket Wrench.

No. 1, Fine tinned, brass nut	15.54
No. 1, Polished, nickel plated	22.22

Sap Spouts.—The Breck Sap Spout and Cover, manufactured by Joseph Breck & Sons, Boston, Mass., and illustrated in *The Metal Worker* December 30, 1893, is sold at the following net prices:

Sap Spouts, per 1000	$20.00½
Covers only, each	.06
" with indicators, each	.07
Special Bits, per dozen	2.25

Shot.—In sympathy with the raw material, a further reduction has been made in the prices of Shot. The revised prices, which are announced by the manufacturers under date January 2, are as follows, terms net cash 30 days, or 2 per cent. discount for cash in ten days:

Drop Shot up to B, 25-pound bag	$1.35
" " 5-pound "	.35
Buck Shot (including Bs, Ts and F), 25-pound bag	1.60
Buck Shot (including Bs, Ts and F), 5-pound bag	.40
Chilled Shot, 25-pound bag	1.60
" 5-pound "	.40
Dust Shot, 25-pound bag	2.00
" 5-pound "	.45

In lots of 2000 pounds and upward, taken at one time, a discount of 20 cents per 100 pounds and 2½ per cent. will be allowed.

Agate and Granite Iron Ware.—A revised price-list of Agate Iron Ware has been issued by Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, and a revised price-list of Granite Iron Ware by the St. Louis Stamping Company, St. Louis, Mo., and 96 Beekman street, New York. In both of these lists there has been a general revision and reduction of the list prices, and a change has also been made in the discount, which is now 25 per cent. instead of 33⅓ and 10 per cent. as heretofore. The net result is referred to as being a considerable reduction in the price of the goods.

Glass.—The Glass industry is waiting for developments and supplying the present demand. There is no particular attempt to anticipate the future, as the uncertainty of tariff legislation prevents any definite steps in the line of expansion. Favorable building weather in a large portion of the country creates a demand which it is understood is preventing any accumulation of stocks at factories. While no factories are reported as closing down, few additional ones are starting up, and an equivalent to 1118 pots are represented as now being in operation. As has been pointed out before, any change in tariff is not likely to take effect during this fire, up to July 1, 1894, but it will have a depressing effect upon prices if it is reduced. In some other lines related to the Hardware trade prices have been reduced in anticipation of lower tariff. Pittsburgh prices are given as 85 and 5 and 5 per cent. discount for single, and 85 and 10 and 5 per cent. discount for double strength Window Glass. Western factory quotations are reported as 85 and 7½ per cent. discount for single, and 85 and 10 and 10 to 85 and 15 per cent. discount on double strength Window Glass. The Plate Glass situation has improved to a limited extent, as some factories have orders and others anticipate starting. Prices show no improvement over those for the past few weeks and are reported as follows:

Large plate, 60 and 10 and 10 to 70 and 5 per cent. discount; small 70 and 5 to 70 and 15 per cent. discount.

Old Metals.—The market for Old Metals, including Scrap Iron, continues dull, due largely to the fact that consumers have not yet finished their stock taking and annual adjustment of accounts. Prices are somewhat irregular and incline to weakness. The following quotations represent about the prices paid in New York for moderate quantities:

Heavy Copper	℔ lb		7¢
Light and Tinned Copper	℔ lb		6½¢
Heavy Brass	℔ lb		5¢
Light Brass	℔ lb		4½¢
Lead	℔ lb		3¢
Tea Lead	℔ lb		2¾¢
Zinc	℔ lb		2½¢
No. 1 Pewter	℔ lb		14¢
No. 2 Pewter	℔ lb		6¢
Wrought Scrap Iron, ℔ gross ton		$7.00 @	$8.00
Heavy Cast Scrap, ℔ gross ton		8.00 @	9.00
Stove Plate Scrap, ℔ gross ton		4.00 @	5.00
Burnt Iron, ℔ gross ton		2.50 @	3.00

Old Rags, Paper, &c.—Business is very quiet in the market for Paper Stock. Prices remain at about the level of last week—viz.:

No. 1 White Rags	℔ lb	3¼ @	3⅓¢
No. 2 White Rags	℔ lb	2¼ @	2½¢
Mixed Rags	℔ lb		¾¢
Blues and 3ds	℔ lb	1 @	1¼¢
Hard Sized White Shavings	℔ lb	2¼ @	2½¢
No. 1 White Book Shavings	℔ lb	2 @	2⅛¢
No. 2 White Book Shavings	℔ lb	1 @	1⅛¢
Light Book Shavings	℔ lb		¾¢
No. 1 Mixed Shavings	℔ lb	¾ @	1 ¢
No. 2 Mixed Shavings	℔ lb	½ @	¾¢
No. 1 Printed Books	℔ lb	1 @	1¼¢
Ordinary Mixed Books	℔ lb	½ @	¾¢
Newspapers	℔ lb	½ @	3-5¢
No. 1 Manila Paper	℔ lb	1 @	1⅛¢
No. 2 Manila Paper	℔ lb	⅝ @	¾¢
Bogus Paper	℔ lb		½¢
Common Paper	℔ lb		⅜¢
Straw Chips	℔ lb		½¢
Binders' Clippings	℔ lb	½ @	⅝¢
Jute Butts	℔ lb	1⅞ @	2 ¢
No. 1 Jute Bagging	℔ lb	1 @	1¼¢
Mixed Bagging	℔ lb	¾ @	1 ¢
No. 2 Bagging	℔ lb	½ @	¾¢
Hemp Twine	℔ lb	2 @	2¼¢
Manila Rope	℔ lb	2¼ @	2½¢
Jute Rope	℔ lb	1½ @	1⅝¢
Mixed Rope	℔ lb	¾ @	⅞¢

Old Rubber.—The market for this material is a very narrow one, and values continue low. The following are about the prices given for Old Rubber delivered in New York:

Car Springs, ton lots, ℔ lb.		@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.		@	.03
Rubber shoes, less than carloads, ℔ lb	0.02¼	@	.03⅛
Large Hose, ℔ ton		@	9.00
White Wringer Rolls, ℔ lb.		@	.04¼
White Syringes, ℔ lb.		@	.05

Trade Notes.

E. L. PARKER & Co., 201 South Charles street, Baltimore, Md., favor us with a very pretty calendar that they are distributing to their friends in the trade. It is made up of six sheets bound together with a silken cord, each sheet carrying the calendar for two months. The printing is delicately done in blue ink and is but a feature of the sheets, the principal charm of which is their pretty decorations, which is particularly well printed in colors. The various scenes depicted on the cards are all devoted to bird life.

WE ARE INDEBTED to Bruce & Cook, 186 Water street, New York, for a copy of their calendar for the year 1894. They continue the style with which the trade have become familiar, which is a single large card with the calendar printed in double columns at each side of a center picture of the firm's warehouse. The border decoration is a fine design, printed in red and blue. This is the eighty-second greeting that Messrs. Bruce & Cook have offered the trade, the original firm beginning in 1812.

A SERVICEABLE CATALOGUE is issued by the John Dunlap Company, Pittsburgh, Pa. This firm manufacture an extensive line of Sheet Metal goods, and all the articles are illustrated and priced in the volume before us. Altogether there are 15 sections to the catalogue, which contains nearly 200 pages, the divisions being as follows: Deep Stamped Ware, Shallow Stamped Ware, Spoons, Forks and Cake Turners, Pieced Tin Ware, Japanned Ware, Stamped Tinners' Trimmings, Tinners' Miscellaneous Supplies, Enameled Ware, Galvanized Sheet Iron Ware, Sheet Iron Ware, Iron Goods, Wire Goods, Miscellaneous Goods, Tin Plate and Metals, Tinners' Machines and Tools.

THE NUBIAN IRON ENAMEL COMPANY, 8 to 10 Bonnell place, Cragin, Ill., are distributing desk calendars for the first quarter of 1894. These calendars have a daily memorandum sheet, and they are conveniently mounted on their own stand. The praises of Nubian are sung from day to day in a lively strain on each sheet, emanating from the fertile brain of Manager Bonnell. The invariable refrain is "the best black on earth."

WE HAVE RECEIVED from the St. Louis Stamping Company, St. Louis, Mo., their reduced price-list of Granite Ware. This catalogue, under date of January 1, 1894, illustrates and describes these goods, with descriptions, sizes, &c. Near the front of the book is a telegraphic code, and in the catalogue is a code word for every article made in Granite Iron Ware. The code word is placed immediately over the number or size of each article, and is designed for convenience and to save expense in telegraphing orders.

LALANCE & GROSJEAN MFG. COMPANY, 19 Cliff street, New York, favor us with their reduced price-list of Agate Iron Ware, dated January 1, 1894. The book contains 152 pages, with illustrations and list prices of the full line of these goods made by the firm. These are shown in a large number of styles and sizes, giving an almost endless variety from which to select. Among the new utensils offered to the trade attention may be called to the Agate Acme Coffee and Tea Pots with patent enameled wood handles, Agate Pit Bottom Royal Tea Kettles, Agate Round Handle Ice or Candy Scoops, Agate Pieced Cups, Agate Forged Basting Spoons and Agate Ice Cream Spoons. The catalogue contains an introduction detailing the special advantages of Agate Ware, together with a number of certificates and testimonials from chemical and medical authorities in regard to its hygienic character.

ANTHONY WAYNE MFG. COMPANY, Fort Wayne, Ind., makers of Washing Machines, &c., send us their new catalogue, in which illustrations are shown of the Wayne Combination Washer, Western Star Washer, Anthony Wayne No. 1 and Anthony Wayne No. 2 Washers, Wayne American Washer, Ironing Boards, Steel Clad and other Wringers, &c.

Weathering the Storm.

It is a matter for congratulation that amid the financial storm and stress of the past year the members of the trades represented by *The Metal Worker* have on the whole enjoyed an exceptional immunity from the disasters which have brought low so many corporations and individual traders. The list of failures in the stove, metal, plumbing, roofing and heating trades compares very favorably with those in other lines of industry. Although the year 1893 was with most of our readers one of exceptionally bad business and the profit and loss accounts of too many will show a credit balance of very small proportions, if it does not, indeed, incline the other way, yet they have the satisfaction of knowing that they have weathered a storm which has submerged much stronger and more important concerns. One probable reason for this is that the trades referred to do not generally appeal to the luxuries, but to the necessities of existence. People must be warmed and housed and their sanitary requirements must be attended to, panic or no panic, and for these things they are willing to pay to the extent of their capabilities, while the mere extraneous luxuries are discarded. Yet the good record shown by these trades also reflects credit on the generally sound bases on which they are conducted, and the prudence and integrity which in the main characterize their members.

Electric Heating.

If electric heating ever comes into general use, of which there is at present no immediate prospect, notwithstanding in special applications it has been successful, the predictions of those who have enthusiastically portrayed its possible advantages over other systems may even in that case lack fulfillment. It is true that many of the exacting problems which now confront heating engineers in the use of warm air, hot water and steam as a vehicle for the transfer of heat will no longer need consideration, but analagous problems will be presented, and some new ones will be met with that perhaps will give as much trouble or more than the old ones; while many of the old ones will remain almost in their present form, being independent of the medium employed for conveyance of heat from a generator to any part of a building.

Ventilation as Related to Electric Heating.

No matter what system of heating may be employed the problems in ventilation which must be considered in connection with it will remain unaltered. For instance, an electric resistance coil may supplant the steam or hot water radiator now in use for indirect heating; but in any form the new appliance may assume the problem of getting the requisite quantity of air to and through it, and thence conveying the warm air into the space to be warmed and ventilated, will remain in all essentials what it is now, requiring the same special attention for each case, in order that all the conditions favoring or resisting flow of air for such particular case be taken into account and provided for. If the electric heating of buildings ever becomes a widely used system, the present problems relating to size, pitch and support of pipes in hot water and steam heating will not come in, but other and new problems related to the size of conductors and their safe employment will take their place, while the old ones concerned with amount of heating surface necessary for any building, and the proper distribution of the surface to secure desired effects, will not be materially altered.

Heating and Ventilating.

Heating and ventilating will, therefore, continue to be a special branch of engineering, just as they are at present. Electric engineering will be divided up into distinct branches, in the same way that steam engineering now is, and the same process of specializing that has separated marine engineering, locomotive engineering and steam heating from the design and manufacture of stationary steam engines, will inevitably differentiate the manufacture and erection of electrical appliances into separate departments. Only through such a separation can continued progress in the arts be expected, as is proved by the history of the last few decades.

Leakage of Air.

The porosity of walls and the vast amount of leakage around door and window frames are seldom appreciated by those who talk of stagnant air. Experiments with ordinary windows have made evident a leakage of eight cubic feet per minute while the passage of air through apparently tight walls has been frequently shown by experiment. In one instance a room supplied with hot air from an ordinary hot air furnace was tightly closed. The fire place was stopped up, windows were packed with rubber molding and the door shut. The wood work was shellaced and the brick work oiled. A measurement of the air volume entering showed that it was nearly equal to that when the doors were open. If the air entered it was obvious that it must escape somewhere. A second experiment was made after five coats of paint had been put on the walls and ceiling and three coats on the floor. Still the air entered through the register in large quantities, in fact its volume was only 20 per cent. less than in the former case. Such wholesale leakage readily explains the cause of low temperatures in exposed rooms on windy days, for the outside air pressure exceeds that within and the cold air actually leaks through the walls. Surprise is sometimes expressed that in many instances no vent flues are provided when the blower system is installed. This is particularly true of manufactories, offices and stores. Nevertheless, a volume of air sufficient to change the entire cubic contents once in 10 to 12 minutes is frequently supplied in such buildings and escapes only through walls and crevices.

The investigations of the United States Geological Survey in the South reveal the fact that large tracts of abandoned land in Misaissippi, Kentucky and Tennessee, which were formerly under a high state of cultivation, are being rapidly converted into deserts approximating to the "bad lands" of Montana and Dakota. Some of these regions aggregate from 4000 to 10,000 square miles in area, and are so far destroyed that it will take many years to restore them to fertility. Professor Shaler of the Survey urges the immediate planting of willows or other quick growing trees as the only check against further deterioration by preventing the washing away of the soil.

One proof of the falling off in foreign trade last year is shown in the fact that only 5024 vessels arrived at New York from foreign ports as against 5383 in 1892. Of the number arriving in 1893 1114 were American vessels, 304 of which were steamers. In 1892 1219 American craft were among the arrivals.

Destitution among negroes, which is so marked in many parts of the country, discloses the fact that, owing to the general distress, white men are this winter doing work that only negroes did a year ago.

Cost Keeping.

Notwithstanding its vital importance, the matter of accurately obtaining the cost of a manufactured product in detail, or of individual machines or parts of machines, frequently receives but meager attention. The annual balance, or, may be, deficit, is taken as a measure of the relation between the total cost and the selling price of the aggregate product, but just where money is lost and just where it is made is by no means so definitely known. Doubtless in almost every manufacturing business handling a variety of goods certain classes serve by their large profits to carry along the others, which could not stand by themselves.

Even such cost keeping systems as are in operation in some concerns are often so crude or general in their character as to preclude the possibility of obtaining accurate detailed information. Then, too, methods are sometimes incorrect or misleading. The foundry man who merely knows that the average cost of his completed castings is so much per pound is in no position to compete in prices on close estimates with the man who knows individually the cost of his iron in the ladle, and the average expense for snagging, pickling, ratiling, &c., so that he may thereto add his known or carefully estimated cost of molding.

Obviously the same holds to an even greater extent in machine manufacture, where the more detailed the information the more serviceable it becomes in determining where to cut in the cost or upon what figure to decide for a selling price.

The indefinite item of factory or establishment expense, covering fixed charges and to be added to the net cost of the article, frequently leads by its improper application to a distortion of the values. This can be avoided only in so far as the various items of this expense are charged directly to the article made, rather than lumped with others in a general percentage.

Nothing is more evident than that no one system of cost keeping is applicable to all classes of manufacture. The following general scheme appears, however, well fitted to the average establishment making a variety of articles of reasonable size :

In the first place, the hours of labor for which a man is to be paid and the time which he devotes to any given article or process are kept entirely separate. Time under the first heading is kept by any approved check or time clock system, and the pay roll made up therefrom. But the labor upon the specified piece is recorded upon a time slip, giving order number, hours worked, name of piece, character of work performed thereon, and number of tool employed to perform the work. This is signed by the workman, and as soon as the operation is completed passes to the foreman, who duly inspects and countersigns it.

At stated intervals, preferably every morning, these slips are collected, together with any orders, sketches, stock memoranda or the like relative to the same completed work. These records are all filed in a single envelope properly inscribed and numbered. There thus accumulates from day to day a complete record of the progress of the work, which may be consulted at any time. When all slips and orders are collected the filled envelope stands as a complete record of all written orders given, of the date of their fulfillment, of the total amount of stock used, and a detailed individual record of all work done.

In a piece work shop, piece work receipts properly signed by the inspector take the place of the time slips, but still continue to show the progress, and when checked up by piece work price-lists also determine the cost. Outside work upon installation, orders to the purchasing agent, corrections of orders and the like all go into the envelope with the rest.

The marked value of this system lies in the facts that no clerical work is required, unless the cost of the given article is to be figured, and that at any time, no matter how distant from the date of completion of the order, the full record may be taken from the files and the detailed cost determined. This is an important feature where goods are built to be sold at standard prices and costs require to be figured only at intervals.

This system in actual operation has shown itself readily adaptable to existing circumstances, elastic to a remarkable degree and free from the peculiar inconvenience of many book systems, where many pages must be scanned to obtain all the time chargeable to a given order.

Business in Canada.

A firm of hardware manufacturers and makers of heating apparatus, located in Canada, write to us in regard to the present condition of business in the Dominion and the outlook for the current year, as follows:

So far as can now be seen the prospects for general business throughout Canada are fair. The country generally is in a pretty sound condition. Some of the large cities and towns are suffering from real estate speculations, and also many of the active business men have lost severely by fall in stocks and wheat. The losses in this way for one city alone have been estimated as high as $10,000,000. Losses of this character are spread pretty generally throughout the community. This, however, does not necessarily affect general business, and probably but few houses have gone outside their legitimate business during the past year. We cannot say that our business has been injured directly by the financial stringency, but no doubt indirectly we have suffered, and we expect to feel the effects more during the coming spring should there not be a sudden reaction and a general improvement in business in the States. Although we have little direct intercourse with the States, it is impossible that we should not suffer by any depression which exists over there. We have at the present time a considerable amount of building work on hand, and there are several large buildings about to be put up here, but no new ones will likely be projected unless business improves generally. The demand for staple goods, upon the whole, is satisfactory, but prices are low, and the trade are very cautious, buying only in very small parcels on a "hand to mouth" basis.

The difficulties of doing business in Canada are very great, from the fact that our market is limited ; and it is not possible, except in very few instances, to carry on one special line of business. But the variety has to be increased in order to make the volume of trade sufficient to cover the expenses of large establishments. Houses doing a large business, embracing many lines, do so at comparative disadvantage. On the other hand, by having a variety, it is possible to save a little profit on some lines; while the leading lines may be cut even below cost. It is also a fact that we have to compete with surplus stocks from the States, which our tariff is not high enough to prevent being thrown on the market.

In the Good Old Days.

BY M K SULLIVAN.

How plainly I can see it, the shop of Silas Dean !
On the big open square, where the children used to play,
With its gray wooden shutters, and its door of faded green,
Which I used to bar and fasten at the close of the day.

There's the long wooden counter and its ledger for the day,
And the floor newly sprinkled and swept in groove and tongue ;
On the shelves, in the windows, from the ceiling, in array,
Gleam the kitchen's bright utensils for housewives old and young.

To no one branch restricted was the tinner bright of old,
A man of truest genius, he gloried in his craft ;
For he could pipe a furnace, or make a candle mold,
Set a pump, roof and "spout it," or figure from a draft.

There's the group of weekly peddlers getting ready for their trip,
With carts on Monday morning, all drawn up to refill,
With dish kettles, tea kettles, bread pans and drip,
Dippers, cups and muffin rings, to fill out the bill.

What odds and ends those peddlers brought in barter for our wares,
Bibles, books and pamphlets, songs of every hue and kind ;
Pewter mugs and candlesticks, iron tongs in pairs,
Metals, brass and copper, on their wagons strapped behind.

But times have changed since then, boys, and business methods too ;
And all that you can hear is nothing but machine ! machine !
It has spoiled the tinners' handicraft, their lable of true blue,
That the workmen used to wear in the days of Silas Dean.

The Department of Immigration reports that during the last fiscal year there arrived at our ports 440,793 immigrants. Of these, 1063 were not permitted to land under the limitations of the law, and 577 were returned to countries from whence they came by reason of their having become public charges. The total arrivals were 141,034 less than the previous year.

A friendly act of the French Government is the presentation to the State of New York of the major portion of its World's Fair educational exhibit, consisting of the work of pupils in the primary, secondary and normal schools of France, as well as a pedagogic library, containing text books used in the public schools, works of reference &c. The collection will be placed in the Capitol at Albany.

The London *Times*, in a review of British trade during 1893, says that the English carpet and shoe trades and the Birmingham screw making industry have felt the effects of American competition.

Chicago has a deficit of nearly $3,000,000 in the municipal treasury staring it in the face.

Annealing Sheet Iron.—I.

Past and Present Methods of Annealing Sheet Iron and Preparing it for the Market.

BY AMBROSE BEARD, CAMBRIDGE OHIO.

Supplementing, the articles which appeared recently in *The Metal Worker* under the caption of "Sheet Mill Progress," it is intended now to present a description, together with illustrations, of old and new methods of annealing sheet iron and preparing it for the market.

The old method of annealing sheet iron, which originated in England, had a few ardent adherents in the United States at a no later date than 1883, but finally it has been entirely dropped, except in annealing heavy gauge—*i. e.*, No. 18 and heavier. These gauges are still annealed in that manner unless otherwise ordered.

The old process was known as "open annealing" and with it followed a train of annoyances in the shape of scaled or burnt sheets that led progressive sheet mill men to adopt other means of annealing or softening and preparing their product for sale. The accepted method was known as "box annealing," and thus it came that the two kinds of sheet iron were on the market until early in the eighties.

Terms Used by the Trade.

The variety of terms applied to sheet iron in its progressive conditions toward perfection are always puzzling to a new buyer. He will see specifications reading "B. A." and ask for an explanation. One person will tell him it is "blue annealed," another "black annealed," and yet another "box annealed." As a matter of fact the terms are synonymous, and he will get the same quality no matter under which term he orders, the meaning of each being "box annealed," but, as will be hereafter explained, it does not follow that the sheets will be blue or black; they may be gray. Box annealed sheets should, however, under uniform treatment be all of a good dark blue color. To further explain the mystification of terms, "blue annealed" sheets, if of the heavier gauges—*i. e.*, No. 18 and heavier—may be "open annealed" and at the same time "blue." Yet strictly speaking the letters "O. A." should represent their quality. There are many other terms met with, such as "pickled;" "P. & C. R.," which means "pickled and cold rolled;" "C. R.," meaning "cold rolled." Continuing the variety such terms as "polished," "planished," "glanced," &c., will be met with, all of which represent higher degrees of finish, some equal to "Russia," but as these are manufactured under patents and the processes are justly the property of those who have spent time and energy to develop them the details are kept from the public. The qualities referred to in the subject under consideration are such as are made by the ordinary run of sheet mills.

The Uses of Sheet Iron.

When the fact is taken into consideration that a competent authority places the production of iron and steel sheets within the United States at about 400,000 tons per annum it is very natural to ask the question, "Where does it all go?" It would be difficult to answer this question off hand. The principal uses would soon come into mind—viz.: Galvanizing, for cornices, ornaments and a general line of building material. Next come black sheets for roofing, &c., followed by stove pipe. For the purposes mentioned probably two-thirds of the sheets rolled in a year are used. To find out what becomes of the remaining third we have only to call to mind the following:

Tin plate consumes a large quantity of black sheets and it is to be hoped that favorable circumstances will help keep up the increase. Then follows perforated sheet steel for use in milling machinery and many other purposes. Carpet tacks made from sheet steel, washers, ferrules, and a hundred and one small things. It is also used for manufacturing blowers, and their pipe connections, smoke stacks, house furnaces, engine jackets and parts of electric dynamos. Large quantities are consumed in making steel wheel barrows, kitchen sinks, frying pans, drip pans, stoves for burning oil or coal and a numerous variety of kitchen utensils. It is part of the construction of the millions of traveling trunks daily transported and is used for making buttons. Handsome sheet steel ceilings can be seen everywhere and plastering lath is made of the same material. Expanded metal in its variety of forms is all made from iron or steel sheets. It is hardly possible to look around without seeing this useful form of iron or steel worked into some serviceable shape and the list of articles into which it is manufactured might be continued *ad infinitum*. The continuous increase in the uses to which this material is put has caused growth of productive capacity to a point supposed by those competent to judge to be a little ahead of requirements. Buyers are more exacting and manufacturers have consequently been obliged to keep pace with the times by turning out sheets of unquestioned good quality and appearance in order to hold their trade. The annealing department is largely responsible for such results. Upon the supposition that the mill has furnished clean sheets, carefully rolled, free from scale marks or buckles, the rest depends upon the annealer and shipper. It is the purpose of this article to explain old and new methods in the finishing process.

Old Style Annealing.

Fig. 1 represents an old style sheet iron annealing furnace. It is also a modern furnace for another use—viz., reheating packs of sheet iron for rolling into light gauges. Formerly it served two purposes, now it serves but one. In the early days of sheet iron rolling in America an extra furnace of this description was in every sheet mill to be used for annealing. In Great Britain this is not the case; there is not usually

an extra furnace, and the heater and helpers have to arrange to do their softening as best they can. If the work gets ahead of them it is sometimes necessary to work so late on Saturday night to catch up that they do not get home until Sunday.

The work of open annealing is done in the following manner: The sheets are made up in bundles of six to 12 each, according to their weight, the object being to have the bundle and bands weigh from 140 to 150 pounds. An inside sheet — *i. e.*, one from the middle of the pack—is placed on the top, and next to it is a smooth sheet surface, is transferred to the top of the bundle, the bands are fastened and when cold the material is ready for the shipper or "stock taker," as that individual is called on the "other side." This process has two very objectionable features—it delays operations at the rolls and it produces sheets that are uneven in appearance. If the furnace is not working right there will be a red oxide on the sheets, in patches, and under the most favorable conditions scale will peel off the sheets whenever they are bent. English galvanizers quite frequently choose to do their own annealing in bar furnaces, as they sheets of high finish, but the general quality of iron and steel sheets such as are marketed every day in large quantities does not nearly approach the excellence of the American product. Such, at least, was the open expression of opinion made by British visitors to this country a few years ago. So long as they are not able to encroach upon the markets of the United States there is no reserve in giving them the benefit of valuable experience.

Fig. 2 is a sketch showing general design of an old style tin plate annealing furnace. The furnace is kept hot continuously, and when a box is "cooked"

having the gloss upon it produced by being next to the surface of the chilled roll when finished. These bundles are then placed in furnace B, being passed in through door A and turned up against the sides of the furnace until they become heated. They are then turned down and piled evenly upon each other on the floor of the furnace and are allowed to remain there until sufficiently soaked. During this time it is customary to cover the pile with waster sheets to protect the edges and surface of the good sheets from a rash flame. The bands with which the bundles are to be tied, usually ½ inch half oval, or ⅞ by No. 12, or a size known as "wagon box," are placed in the furnace alongside the bundles so as to make it easy to apply them. When the bundles are drawn, one at a time, from the furnace, the second sheet, which has the glossy find it more economical than paying for scale which is stripped from the sheet in pickling and is lost in the waste from the vat. They prefer to suffer the expense of box annealing and save weight in the body of the sheet. This custom, however, is not by any means general. During a British experience of several years the writer was frequently asked by sheet iron workers why it was that sheets were so scaly and often endeavored to interest manufacturers in adopting better annealing methods, but the invariable answer was that the consumer would pay no more for the better than the poorer quality. Be this as it may, it is proven in American practice that it is the cheaper method to box anneal. The reason for this is hereafter explained. It must be borne in mind by foreign readers of this article that the fact is not lost sight of that some English makers produce it is taken out by means of a very antiquated looking truck or carrier having a leverage of something like 15 feet, the carrying capacity being obtained by forks attached to the lever, which are placed under the bottom of the boxes. The axle acts as a fulcrum, a small army of workmen apply their weight and muscle to the lever and by main strength drag the bottom, the box and the contents, weighing altogether about 3000 pounds, from the inside of the furnace to the place for cooling. This device is also used in American tin mills, but some improvements have already been made in the method of handling boxes and others are being considered.

Box Annealing Furnaces.

For reasons previously mentioned and the additional reason that complaints from consumers were strong and numerous the old method of open annealing

was abandoned by many makers early in the history of the industry in this country. Some of them continued to cling to old traditions until forced to make a change, but the majority readily accepted the new process. The quality of sheets produced under the old plan of working was not satisfactory, and the work could only be done by skilled workmen. In box annealing common labor can be employed, and only one skilled workman is needed to superintend the operations, no matter on how large a scale they are conducted. Large quantities are annealed at one time, and the general expense is less, while a far superior product is obtained.

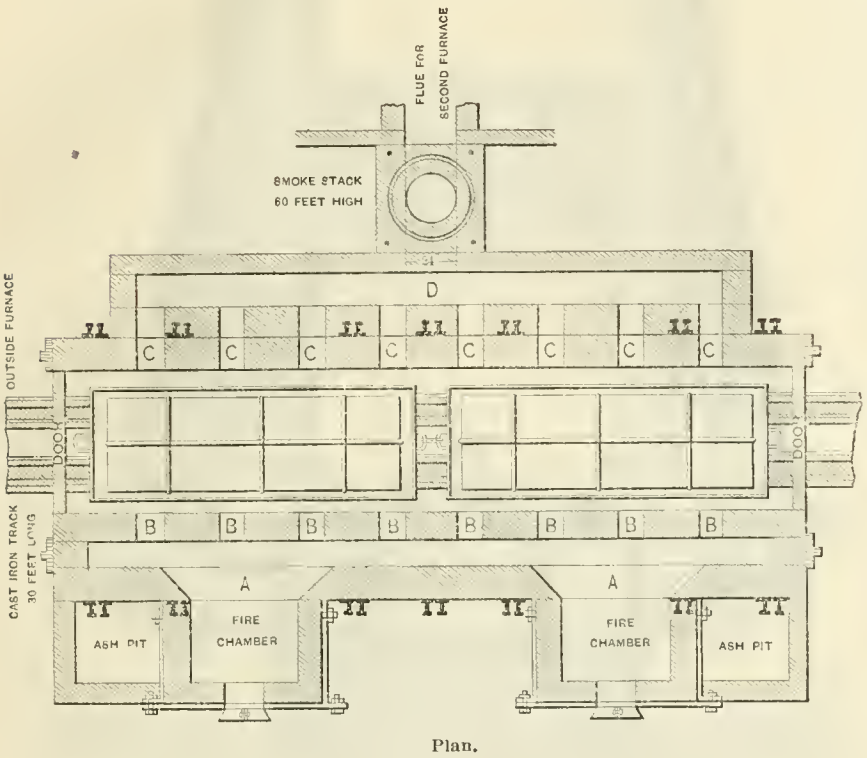

Fig. 4.—Double Box Annealing Furnace.—To be Built in Pairs and Operated by Only One Smoke Stack.

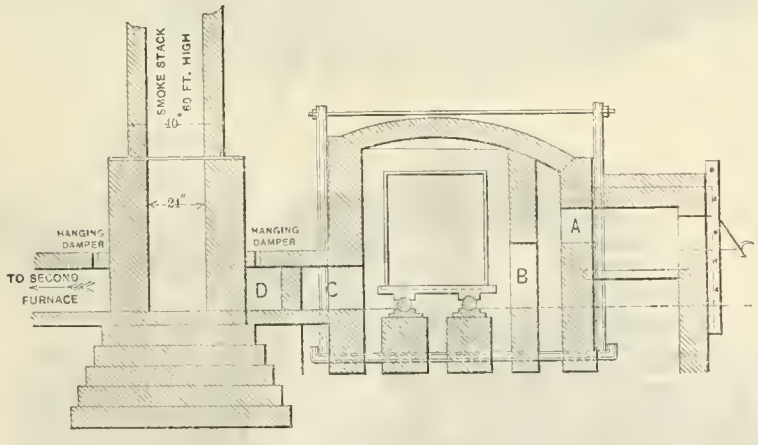

Fig. 4.—Section through Smoke Stack.

To illustrate the variety of improved methods in box annealing three drawings are shown. Fig. 3 represents a type of furnace that has been used successfully; the drawing is self explanatory and is accompanied by another design, Fig. 4. Each of these furnaces is what is known as a double annealing furnace; two boxes are drawn into the furnace together and with a slight increase in firing area over a single furnace, twice the amount of work is performed, a saving being effected not only in fuel, but also in labor.

The furnace represented in Fig. 4 is 30 feet long and 6 feet 6 inches wide inside. It will be noticed that there are two fire chambers. From these chambers the flame travels over ports A and is allowed to expand in the intervening space between that and ports B, where it strikes the annealing boxes at the bottom. The bulk of flame travels upward, following the arch of the furnace, and completely envelops the box; at the same time part of the heat travels under the carrier and thus a perfect distribution is effected. The flames pass out through the small ports C, and should it be found that heat is being concentrated in any part of the furnace in too great a degree, it can be regulated by placing fire brick in any of the ports C. Passing through these ports into flue D smoke escapes to the stack. At a point near the smoke stack a hanging damper is placed on a pulley to regulate the heat of the furnace. In the old style of box annealing furnaces the space between ports A and B is not allowed. Instead of this, the flame strikes the annealing boxes with its initial force before expansion and as a result boxes are badly burned and cracked when only a short time in use. It is justly claimed as a result of experience that nearly the very last unit of heat can be used in a furnace constructed in this manner. The additional room given for the expansion of the flame causes more gas to form and combustion is more perfect. In evidence of this it may be stated that smoke disappears in a few minutes after a new fire is put on. To make success more certain in operating a furnace of this design a steam jet should be introduced below the grate and the ash pit closed with tightly fitting doors, and the stoke hole should also be kept closed. An important point in favor of a furnace of this design is the arrangement for operating two furnaces with only one smoke stack. By adopting this plan a large space is left between the two furnaces, in which the crane used to hoist boxes is placed, and it also serves as a storage place for boxes not in use. If it is desired to place the furnaces in line with each other, the smoke stack may be placed between the two fire chambers as in Fig. 3 and connected by return flues, but these are always a source of trouble, as they become filled with dust and require constant cleansing.

Penny-in-the-Slot Electric Lights.

A correspondent of the Cardiff, Wales, *Western Mail* describes the new penny-in-the-slot electric lamps that have been recently fitted in the cars of the underground railway in London as follows: The penny-in-the-slot electric lamps have come into use on the London underground railways this week. Trusting to memory, I will say it is two years since the first experimental lamps were put on a few trains and described by me. Since then arrangements have been made to fit the lamps to all the trains and the work is now complete. There are four lamps in each compartment. If you want to read, and the ordinary light is insufficient (that is a dead certainty), you put a penny in the slot and obtain an electric light which lasts you half an hour. If you want more you have to put in another penny. The lamps are conveniently placed at the back of the seat so as to throw the light on the book or paper. They were in immense demand at the outset. Every one wanted a pennyworth of electric light, and I believe the people used the trains on purpose to try the lamps.

Mexico is about to undertake an important irrigating enterprise, which will, when completed, afford water for some 500,000 acres of good cotton land. Works are to be commenced, consisting of a dam 6 miles about the junction of the San Juan and Rio Grande rivers and some 100 miles of canal and laterals.

The fishing industry appears to have been happily exempt from the general depression of last year. The annual report from Gloucester, Mass., speaks of a prosperous fishing season in 1893, with the catch of that section estimated in value at $9,000,000, and receipts approaching those of 1892, which was an exceptionally good year. Fortunately financial stringency does not repel from our coasts the finny denizens of the deep.

Drop Press and Drop Lifter.

The six-poppet drop press made by the Miner & Peck Mfg. Company of New Haven, Conn., is intended for use in stamping metal ceiling plates, metal shingles, and all work requiring square dies. This machine is made in several sizes, that illustrated in Fig. 1 being of sufficient size to take in a die 27 inches square. The method here shown of holding the square die is believed to be preferable to that of four poppets holding at the corners. The hammer is arranged to hold the soft metal by four bolts with projecting heads.

The poppets are fitted by the Peck improved process, are finished all over, and in such a manner that the screws have a perfect range. The holes for the poppets are bored out and poppets fitted to them and securely and accurately held. The bolts for holding the guide rods are very large and have long nuts carefully fitted to insure them against coming loose, while under the heads of the nuts are large iron plates to relieve the guide rods from jar and its injurious effects.

These drops are arranged to be worked, if desired, by hand or foot power over a flanged pulley; but the manufacturers recommend that they be used with the Peck automatic lifter, shown in Fig. 2, for the reason that with this attachment much more, and more uniform, work can be produced than by foot or hand, and with less fatigue to the operator.

The frame of this lifter is of new design and is much heavier than the earlier forms. The length of the bearings has been increased, and on the main shaft, instead of making back bearing smaller, as in the former pattern, it is continued through of the same size as the crank bearing. Instead of having collars on the shaft at the bearings, the hubs of the lift and the dog cranks are made to act as collars, thus leaving the shaft of one size its entire length, with no shoulders to weaken it.

The strength of the gear and pinion has also been increased. The pillow blocks on the back of the shaft are bushed, these bushings being of uniform size, so that new ones can be inserted when the others become worn. In the place of cup screws, tapped into the frame to hold the main bearing caps, bolts are passed through the frame and held with check nuts. In the larger sizes the makers prefer not to have the sockets divided and with rubber springs inserted in the flanges, but to insert a rubber cylinder in the cavity in the hammer under the lifter belt. This arrangement has the advantage of allowing the pinion on the back shaft to be placed in the center of the back shaft, instead of at the end next to the bearing; and, thus arranged, should any extra strain accidentally come on the pinion, the shaft will spring and relieve the frame, whereas if the pinion is close to the frame an extra strain, such as the breaking of a tooth of the gear or the pinion, would be liable to break the frame. The crank illustrated is provided with fine adjustment, designed for silver and other fine work, and enables the blow to be changed in length by half inches. This form of crank is placed on lifters only when specially ordered. The shafts are made of hammered crucible steel; cranks, ratchet and dog of forged steel, and all the other parts of carefully selected materials. These machines are now in successful operation in the stamping works of Lyles & Mills, 231 William street, New York.

THE MINER & PECK DROP LIFTER.

THE LETTER BOX.

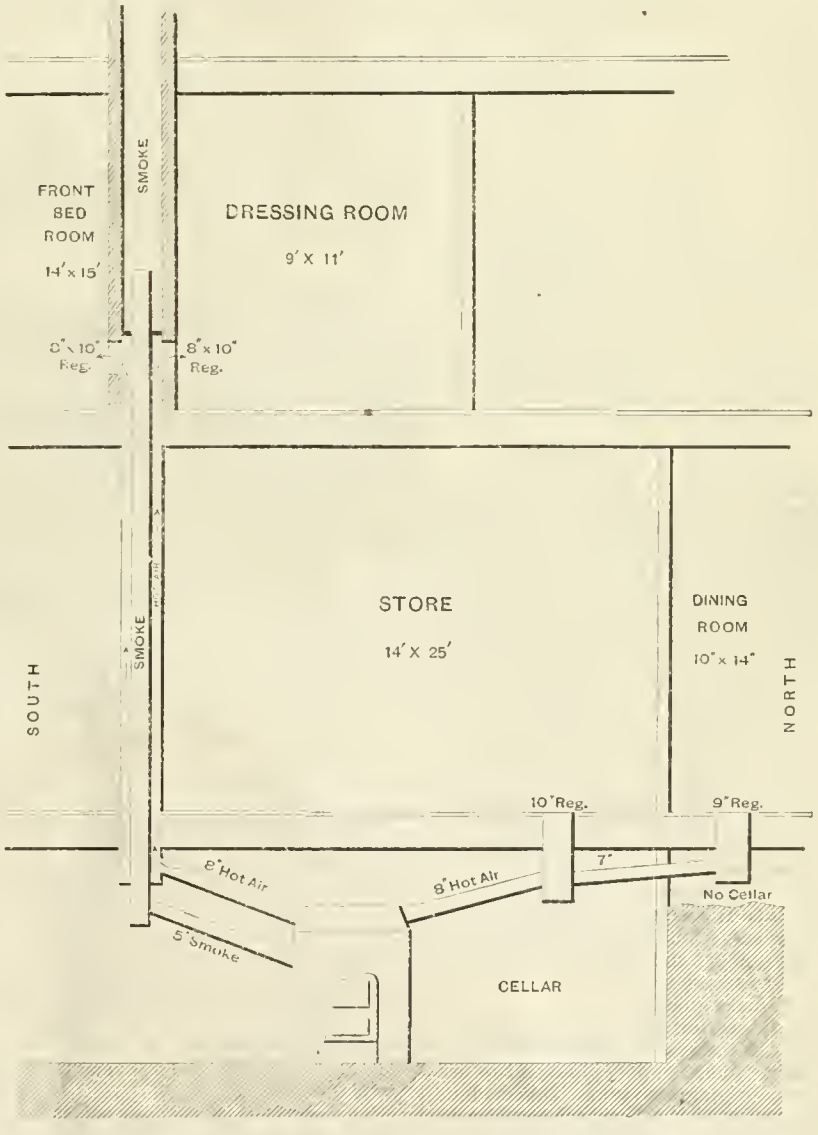
Trouble With Electric Bell.

From R. P., *Huntsville, Texas.*—I am in trouble with electric bells, one single stroke and the other vibrating. The difficulty is that I cannot get a blow hard enough. The vibrating is not as strong as the other. I have eight cells of dry battery and the hammers are on No. 14 brass wires. The size of the magnets is 1 inch in diameter by 1⅝ inches long. The core of the magnets is $\frac{7}{16}$-inch in diameter. Do you think the magnets too small, and if so, how can I make them stronger? I want to know if in Fig. 5 in *The Metal Worker* of December 2, page 34, the small spring shown just below the one marked E that strikes the contact screw is of much use. The spring seems to be of no use in the vibrating bell, as it lies flat. On the single stroke bell there is no spring. I have had these bells worked on three times at an electrical establishment where they were made, but with no good result—simply a loss of time and money.

Answer.—We assume from our correspondent's letter that his bells are connected in series, and that the whole current passes through each bell. Eight cells of battery are entirely too much and are liable to burn out the contact points on the bells. The resistance of the magnets should be about the same on each bell to have them work properly—in other words, there should be the same size and amount of wire in the coils of each bell. The size of his magnets appears to be right, provided they are properly constructed. The small contact spring should be substantially the shape shown in the cut, as referred to. Both bells should have these springs, as they not only admit of a more delicate adjustment, but also prevent the adjustment being deranged by the hammer-like blows of the armature on the screw. Four cells of battery, if in good condition, should furnish an abundance of power to operate these bells. Never connect batteries of different makes together. Take four of the cells and test them. If our correspondent has no galvanometer this can be done with an ordinary electric bell. Connect it by means of short wires to the battery. If it rings sharply the battery is all right; if it does not, test each bell separately in the same manner, to discover which one is to blame, as one weak bell in a battery of 50 would destroy its working power. If the battery proves all right, close the circuit and try the adjustive screw on the vibrating bell. Turn it back until the magnet will scarcely attract the armature, then reverse and turn the screw up slowly, and when the proper adjustment is reached the bells should ring clear and regular. If this does not remedy the trouble, test the bells separately. If all else fails, try connecting the battery in multiple arc—that is, connect all the negative elements with one wire and all the positive with the other. The bells may be wound for a quantity current rather than intensity.

How a Furnace Job Was Managed.

From A. S. R., *Philadelphia.*—A short time since I was called upon to put a heater in a house which had but one flue, and that stopped at the second floor. It was necessary to heat the store and dining room on the first floor and the front bedroom and dressing room on the second floor. The cellar was so arranged that the heater had to be set about 10 feet from the front of the building, which faces the south, the back of the heater being against the west wall. The cellar being very shallow it was necessary to cut the heater down to get an elevation, but I could not get enough to run a pipe from the heater direct to the dining room. To continue the flue to the cellar I used an 8-inch pipe, which was inserted in the bottom of the flue. I then connected this with the hot air pipe from the heater, which was also 8-inch, with a T joint, leaving a 5-inch hole in the head at the bottom. I then ran a 5-inch pipe inside of the 8-inch pipe above the cut off above the register on the second floor. This gave me a chimney and hot air flue, which heats the front bedroom and dressing room. I then made a register box from a joint of 10-inch pipe, placing a 10-inch floor register near the east wall of the building. I ran an 8-inch pipe from the heater to register, continuing from the same box with a 7-inch pipe to the dining room, connecting it with a 9-inch floor register. There is no cellar under the dining room. The inclosed sketch will show how the pipes were run. This may be of some use to a brother tinker, or perhaps a better plan could be suggested.



How a Furnace Job was Managed.

STEAM AND HOT WATER.

Piping for Water Warming.

BY KNIGHT.

The piping in a warming apparatus, forming as it does the connecting link between the boiler and the radiator, performs a duty important in itself and easily includes in its proper erection the success or failure of the apparatus. The pipes in a warming apparatus stand in the same relation to the boiler and radiators as is occupied in a power plant by the main connecting the boiler with the cylinder of the engine.

The heat generated by the combustion of the fuel on the grate is absorbed through the fire surface into the water and is conveyed through the pipes to the radiator or to the engine cylinder, where in the radiator it makes its appearance as sensible heat and in the cylinder as motion. In either case the piping represents the means of conveyance of the power represented by the heat to the point at which it is to be applied. That this heat, representing a certain amount of power, be transmitted with the greatest ease and with the least loss, is for the interest of the owner of either the warming apparatus or the power plant. To secure this transmission to the best advantage it is necessary to give the most careful attention to the details incident to the erection of the piping.

Principles of Circulation.

To put in the piping in the average warming apparatus correctly is not an especially difficult feature of the work, but it is one to which it is well to give careful attention, both as to the minute details and general features. In a water warming apparatus the idea to be kept in mind in the erection of the pipe is the law governing the circulation of water, the rise of the warmer column of less density from the boiler to the radiating surface and the return of the cooler column of increased density to the boiler, through the return pipes, the velocity being in proportion to the difference in temperature and the vertical hight of the radiating surfaces above the absorbing surfaces. To arrange the piping to secure the best results it is necessary to so plan it as to secure an even circulation of the whole apparatus as a unit without making an effort to secure special results from the individual radiators.

In the earlier days of water heating it was the Canadian practice to run a separate line of supply pipes and return pipes for each radiator. This had its advantages in allowing each radiator to do its work independently of the remainder of the apparatus. Its disadvantages were the extra expense of running so many different lines and having so much unnecessary material in the cellar. As attempts were made to include larger work within the scope of the water circulation it was found that pipes could be run with exactly the same freedom that could be employed in steam warming, and further familiarity with the application of the principles of water circulation has led to the many different forms and methods of piping which are now prevalent among the trade.

Obstacles to Circulation.

The two practical obstacles opposing circulation are either of the nature of a burr or some obstruction in the pipe or air pockets, both of which can be avoided by the exercise of a little care and attention. The other causes tending to restrain the movement of the water in circulation are the friction in the pipe and the loss of head, due to a change in direction of the flow of the circulating column, the short radius of curvature of elbows and fittings used in the work making this last loss quite considerable. The loss due to friction cannot be avoided. The loss due to the use of elbows can be overcome only by employing fittings whose radius of curvature is approximately five times their internal diameter. It is well to employ in water work the fittings which are now manufactured specially for this purpose and which come much nearer realizing the theoretical conditions than the old style fittings.

The amount of loss due to friction and change of direction under any given conditions can be very accurately estimated, but in the writer's opinion such calculations would seldom be made for work of no more importance than the average warming apparatus. An accurate knowledge of these principles might prove of advantage to the average fitter, but it is to be doubted if the application of them would aid him materially in proportioning the piping in any system for house warming. We make a decided recognition of the effect of these causes in every day work, when we allow a size larger of pipe for a horizontal run than we would employ for the vertical rise, and in allowing extra sizes of pipe to help out the circulation when the conditions to be met are such as need the extra encouragement.

Size of Mains.

In water work, as the return water is to all intents and purposes of the same bulk as the supply water, the same provision must be made for its return as for flowing it—*i. e.*, the return pipes must be of the same size and present the same working area as the supplies. It is generally admitted as a good rule that a square inch of pipe area will flow enough water at an average temperature to supply 75 to 100 feet of radiation, working under average conditions.

This can be done without necessitating an undue velocity of the water, and this fact is applied in the evolution of a thumb rule for the calculation of the size of mains for supplying any given amount of radiation. This rule is a good one, very simple, and can be applied to low pressure steam as well as water. A statement of it is as follows: To find the capacity of a pipe in square feet of radiation supplied square the nominal diameter of the pipe and multiply by 100. Or, to work from the other end, to find the size of pipe necessary to carry any given amount of radiation, divide the number of square feet of radiation by 100 and extract the square root, this giving the nominal size of the pipe. This rule is an old one, but nevertheless is a good one and easily remembered.

An inspection and application of the above rule will show that it does not conform exactly to the statement made before that 1 square inch of pipe area would supply 100 feet, but it is near enough to show that the rule is good guessing and its practicability has been demonstrated by long continued use. Of course, the larger the pipe employed the wider the range of capacity that may be assigned to it.

Size of Branches.

In determining the size of the radiator connections and smaller branches, no one rule can be made to cover all cases. Each radiator manufacturer has a certain standard for water which meets the requirements of average work, and the fitter must govern himself in each instance by the particular conditions to be met.

Of late there seems to have been a movement among the heating fraternity toward the use of small pipes for water circulation, the argument being that the water circulates as well, and that they can be put in at less cost. As a matter of personal opinion, the writer is strongly in favor of using pipe of ample size, preferring the larger to the smaller size, in case any necessity for choice should arise. Every radiator, to maintain a given temperature in a room, requires the flow to it of a certain amount of water. This water can be supplied to it through a pipe of small diameter or of large diameter, within practical limits. The condition to be observed is the velocity with which this amount of water must be delivered to meet the requirements of the radiator. If the pipe is small, then the velocity must be so much the greater; the greater the velocity, the more loss of heat due to friction, the more friction to be overcome, the more boiler power required and the more heat from the coal lost in doing unnecessary work, and finally more liability of unsatisfactory results from poor circulation.

If one is disposed to consider the question minutely, it can be calculated exactly how much water at a certain temperature would be required by a radiator of a given size, working under given conditions, and, knowing this it is not difficult, with a given velocity of the circulating water, to calculate the necessary area of supply pipe. However, it is the writer's opinion, as expressed above, that it is to be doubted if such calculations would prove of material worth in the erection of house work of the average size.

If small pipe is to be employed, make the lines as short as possible and, in case of a question between two sizes of pipe to be used, the weight of argument is generally in favor of the larger size. A good idea, however, to be followed in this is to make the mains of ample size and get the water within a reasonable proximity to the radiators in pipe of good capacity, and

then it will make but comparatively little difference as to the size of the final connection.

HEATING NOTES.

TRAHEY & MCCASLIN of Zanesville, Ohio, have purchased the machine shop and plumbing business of H. A. Morrow, at Cambridge, Ohio. The new firm will do general machine and repair work, and make a specialty of steam and gas fitting.

THE RAYMOND & CAMPBELL MFG. COMPANY, Middletown, Pa., issue a striking calendar for the current year. The calendar proper is a small pad of 12 sheets fastened to the lower corner of a very handsomely colored poster, representing a beauty of the Egyptian type, arrayed in gorgeous colors and carrying a huge ostrich feather fan across her shoulders. In addition to directing attention to this Eastern type of beauty the calendar also brings to notice the Lindemuth Steel Sun steam and hot water boilers made by this firm. The same firm also call attention in circulars to the fact that they have withdrawn their former price-list and issued a new one under date of January 1.

S. T. WILLIAMS, specialist in hot water and steam heating, has severed his connection with Pierce, Butler & Pierce and George B. Cobb & Co., and has accepted the management of the New York department of the Model Heating Company, at 305 Pearl street.

WE ARE INDEBTED to Secretary Reynolds for the report of the fifth annual convention of the Master Steam and Hot Water Fitters' Association of the United States, which is an unusually attractive volume. The volume is bound in tinted card covers, held together by a silk cord, and contains the official proceedings of the convention. An attractive feature of the publication is the bird's-eye view on the front cover of the World's Fair grounds. The portrait that introduces the proceedings is an excellent likeness of Mr. Rutzler, the president of the association.

The citizens of Marlborough, N. Y., recently witnessed a test of a new waterworks system just completed for the Water Works Company by Charles Millar & Son of Utica, N. Y., assisted by John Marsden as engineer. Henry W. Millar and John L. Murray of this firm are respectively vice-president of the water company and secretary of the Utica Pipe Foundry Company, which furnished the pipes. On attaching a hose to a hydrant water was thrown to a hight of 125 feet, and ample pressure shown to reach a fire in any of the buildings of the town. Water is brought 2½ miles from a reservoir having a capacity of 3,500,000 gallons, and which is fed by a series of springs. About 33,000 feet of 4, 6, 8 and 10 inch pipe and 45 hydrants are used in the system. The valves and hydrants were made by the Eddy Valve Company, Waterford, N. Y. The works are estimated to have cost $52,000. The company has a capital stock of $26,000, and is bonded for $26,000 at 5 per cent., all of the bonds being held by Henry W. Millar, John L. Millar, John Marsden and J. S. Bowes.

Chicago's city jail is said to contain 52 prisoners awaiting trial on charges of murder.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

TURNBULL & POSTLE Chicago, Ill., have completed plans for converting the Champlain Hotel, on Sixty-sixth street and Champlain avenue, into an apartment building for H. R. Brook. It will have steam heat, new partitions and other improvements are to be made, at a cost of $6000.

CHARLES A. HILL, Milford, Mass., has a $2000 contract for the plumbing in George A. Draper's new residence at Hopedale.

THE CONTRACT for plumbing in the High School building at S. Milwaukee, Wis., was secured by Loftus & Stallberg.

A STEAM HEATING APPARATUS has been placed in the Hanover engine house by S. A. & W. S. Flickinger of Hanover, Pa. The apparatus not only heats the entire building, but also keeps the water in the boiler of the engine at a steaming point.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until January 30, for the work, including the plumbing, for the United States Court House and Post Office at Danville, Ill. Drawings and specifications can be obtained from the Supervising Architect, at Washington, or at the office of the superintendent, at Danville.

THE CONTRACT for heating the new brown stone residence of Samuel L. Reynolds, at Lancaster, Pa., has been secured by Flinn & Brenneman, assisted by E. E. Palmer, representing the J. F. Pease Furnace Company, Syracuse, N. Y. A No. 320 Economy Special low down steam and air heater will be used. The radiation will be principally of the Excelsior indirect style.

E. K. BARR of 1020 Betz Building, Philadelphia, representing the Herendeen Mfg. Company of Geneva, N. Y., states that the Faultless Furman boilers are specified on the schedule for 1894 for the Department of Public Safety in Philadelphia for use in patrol houses, police stations, fire houses and other buildings.

THE KELLY & JONES COMPANY, 48-52 North Clinton street, Chicago, have completed the steam heating plant in the Lakeside Club Building, Grand Boulevard and Forty-second street; also in the Chicago Athletic Association Building, Washington and Madison streets.

THE J. L. MOTT IRON WORKS, 311 and 313 Wabash avenue, Chicago, are furnishing about $15,000 worth of plumbing fixtures for the new Union Depot at St. Louis. Fred. Abel & Co., St. Louis, do the plumbing.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, have contracted to deliver a Gorton steam boiler and connections to the Pine Ridge Indian agency, Pine Ridge, S. Dak.

THE L. H. PRENTICE COMPANY, 203 and 205 Van Buren street, Chicago, are to furnish a low pressure steam heating plant for the three double flat buildings of D. F. Crilly, Eugenie street.

THE SMITH & ANTHONY STOVE COMPANY, 217 Lake street, Chicago, have contracted to place a No. 30 "Hub" hot water heater in the residence of G. F. Featherstone, West Monroe street and St. Louis avenue.

PECK BROS & CO., 259 Wabash avenue, Chicago, furnished the plumbing fixtures used in the Criminal Court Building. They are also to supply the plumbing fixtures for a new hotel at Hot Springs, Ark., and for the residence of G. E. Orde, Glencoe, Ill.

THE SMITH & ANTHONY STOVE COMPANY, 217 Lake street, Chicago, have received an extra order for 200 Sanitas traps, to be used in completing the plumbing in the extension to the Monadnock Block, Dearborn and Van Buren streets.

THE WALCOTT-HURLBUT COMPANY, 175 and 177 Lake street, Chicago, have received a letter from James A. Arthur, treasurer of the Goshen, Ind., School Board, who speaks in the highest terms regarding the operation of two Eduction Syphon Closet Ranges placed in a school building.

THE LOGAN MACHINE WORKS of Bellefonte, Pa., have just completed the heating system for the new hotel at the State College, embracing twin low pressure boilers conveying the steam to 71 radiators on the different floors. This firm have also just completed two large jobs in Mifflin County and are now placing the apparatus to heat the Presbyterian church at Lewistown.

Dinner to Trade School Instructors.

Last Saturday evening R. Fulton Cutting entertained the instructors of the New York Trade School at his residence, at 724 Fifth avenue, New York. He was assisted by A. H. Mackey, the newly elected member of the board of trustees and three other members of the board, F. Augustus Schermerhorn, J. Pierrepont Morgan, Jr., and Wm. E. Dodge. The plumbing instructors were, Superintendent John Delehanty, John MacMenamy, T. B. Walmsley, R. A. Clarke and three new instructors, George B. Wooda, James J. Lynch and Thomas Kelly, whose assistance is required owing to the unusually large day class this year. The painting instructors were: John B. McGowan, H. Bornhagen, E. A. Kennedy and George Bunce; blacksmithing, F. W. Genicke; stone cutting, James Hughes, Sr., and James Hughes, Jr.; masonry, E. Van Houten, Frank F. Van Houten, D. J. Ahern and Thomas Carey; Carpentry, D. Vanderbeek, James D. Edwards and W. H. Lockman; Printing, Morris Van Vliet and J. M. Unangst. Harry Brill, J. H. Brill and J. Stanly Thomas were also among the guests. Mr. Cutting made an address after the dinner, and was followed by Mr. Dodge. Responses from the guests were made by Mr. Delehanty and Mr. Kennedy, when the end came to a very pleasant assembly.

THE MCDANIEL & HARVEY COMPANY of Philadelphia, Sheet Iron manufacturers, have recently made some important additions to their plant. They have installed a complete modern plant for making Painted and Corrugated Iron Sheets, Curved Sheets and Standing Seam and Roll and Cap Roofing. The plates will be rolled in their own mills and the manufactures completed in their own works. They will continue to make Galvanized Steel Sheets and their "genuine old fashioned Charcoal bloom Galvanized Iron Sheets," Eagle brands. They experienced last season quite a demand for genuine Iron Sheets, and claim that consumers are not slow to recognize the high quality of the Eagle brand.

PLUMBING and GAS FITTING.

Musical Gas Testing.

From an article specially translated from our London contemporary, the *Plumber and Decorator*, we quote the following: A new invention for the detection of the gas of fire damp, called by its inventor, M. Hardy, a formenephone, or fire damp warner, is calculated, if it realizes all that is claimed for it, to render inestimable services to the cause of sanitation in general and to gas fitters and various other trades in particular. The original aim of the inventor was to find a means of expeditiously and exactly ascertaining the amount of fire damp gas present at a given time and place in mines; but, in departing from the beaten track of experiment by availing himself of the well-known effect which air of various densities makes on the sensitive pipes of an organ, the French savant has really invented an apparatus which is applicable to all gases alike—the carbonic acid gas evolved, in shut up apartments, from human breathing; the deadly sewer gas; ordinary coal gas; as well as the original object of the inventor's researches, viz., that of fire damp. The following are the principles on which the construction of his apparatus is based: Two organ pipes of the same note give, when fed with pure air by means of separate pairs of bellows, notes of identically the same pitch. When, however, one of these bellows is supplied, instead of with pure air, with a mixture of air and gas of a different density, the note of its corresponding pipe is modified accordingly; and if the two pipes be operated at the same time the respective beats of each pipe will be seen to vary in rapidity, the increase being noticeable on the side of the mixture of greater density. With a little practice a very approximate valuation of the proportion of the mixture may thus be arrived at. . . .

The formenephone is made of two kinds—the portable and the fixed. . . . The services which this apparatus is capable of affording to the cause of health and sanitation is very great—greater even than the undoubtedly large ones to the mining industry, which motived its first inception. It is possible by it, the inventor has demonstrated, to check the quantity of vitiated carbonic acid gas in an apartment, sleeping or otherwise, or in the largest public building; while air contaminated with foul gases, coal gas and other gases hurtful to life are equally amenable to its control, so that the dangers of the naked light of the gas fitter searching for a leak, equally with that of the miner in the presence of a burst of deadly fire damp, may be done away with; while the physician and sanitarian are furnished with a powerful auxiliary in their war with the skulking specters of disease and death which lurk in unwholesome atmospheres.

A BOARD OF HEALTH in Massachusetts, says a local paper, is sometimes confronted with peculiar conditions while inspecting plumbing work. For instance, there is a house near the Waverley line, where the family eat and sleep in Waverley, but bathe in Waltham, the line between the town and this city running diagonally through the house. The same state of affairs exists in a house at the Newton line.

Domestic Electrical Work.—VI.*

By W. A. W.

ANNUNCIATORS AND ALARMS.—(*Cont.*)

The system of wiring for annunciators, previously shown in Fig. 12, applies to all plain annunciator work, excepting, perhaps, in the case of elevator work. On this class of work a cable containing the required number of wires is used between the fixed and movable points. In wiring an elevator one end of the cable should be securely fastened midway between the top and bottom of the shaft, and the wires from the different floors brought to that point and connected with it, and the other end should be fastened in like manner to the bottom of the elevator, care being taken to allow enough slack so that the cable will in no case, either up or down, be drawn tight. The annunciator is placed in the elevator, the battery usually in the basement, and the pushes are located conveniently on each floor in the usual manner.

In Fig. 13 is shown a combined annunciator, fire alarm and return call system. This instrument is well worthy a place in the highest ranks of domestic electrical appliances. It is not only intended as a convenience and comfort, but its most important mission is to give timely warning of impending danger to the sleeping occupants of a large hotel, whom it might otherwise be impossible to reach in time. While there are numerous ingenious and meritorious systems of this class of work, the one shown in Fig. 13 is here adopted, for the reason that it does all any of them can do, and possesses the merit of being extremely simple, and this is a point well worth considering, especially by those having only a rudimentary knowledge of electricity.

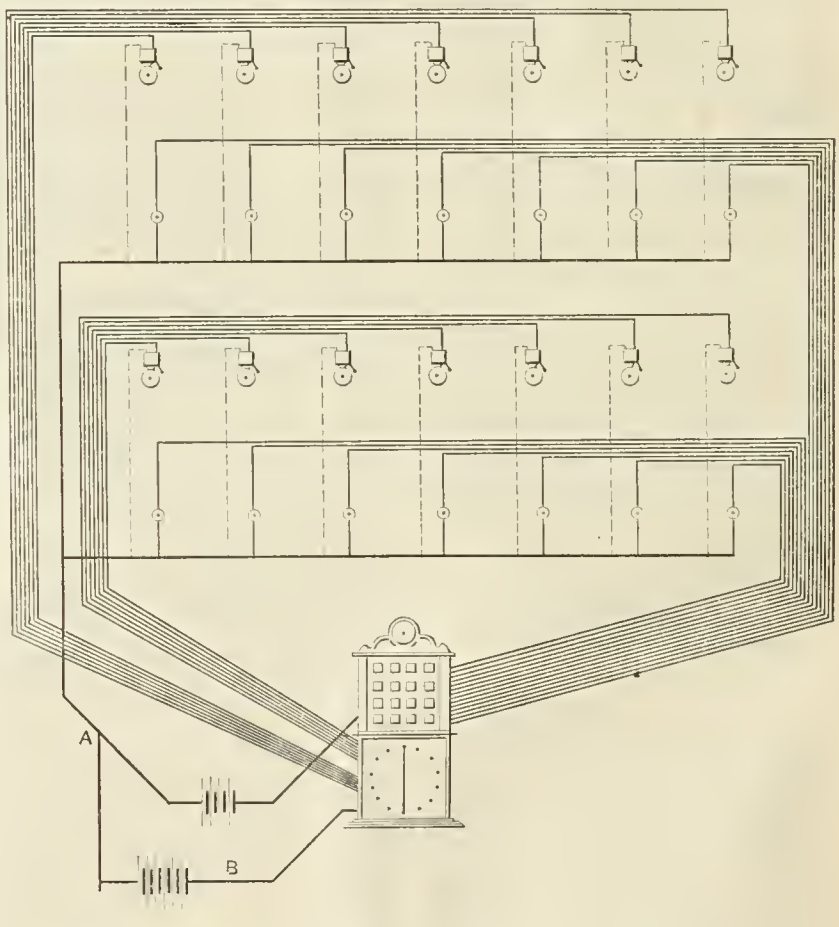


Fig. 13.—Combined Annunciator, Fire Alarm and Return Call Circuit.

In wiring a job of this kind the annunciator part is put in precisely as previously described, with the following additions. A point must be selected for placing the bell, and prepared, as formerly explained, for the push buttons. One wire is run from here and spliced to the battery wire of the annunciator, as shown by the dotted lines in the cut, and the other wire is run direct to the instrument. A separate battery, consisting of six cells, connected in series, must be used. By running a splice from the annunciator battery wire, as shown at A, to this battery and running the

* Copyrighted, 1893, by David Williams.

wire B from this battery to the instrument the wiring is finished. We have now a complete return call system. When a guest rings a call from his room the clerk can instantly indicate to him that his call is receiving attention by simply touching the button on the fire alarm dial corresponding to the number of the room. In case of fire it is only necessary to release the lever, which will cause the bell in every room of the house to ring twice at each revolution, and continue to do so for a long time.

TRAPS AND VENTS.

THE MASTER PLUMBERS' ASSOCIATION of Detroit, Mich., held their annual meeting at the Builders and Traders' Exchange building, January 2. There was a very large attendance, and the following new officers were elected: President, James H. Crumley; vice-president, J. W. Partland; recording secretary, Thomas Norris: treasurer, R. Walsh; financial secretary, W. I. Bolt: sergeant-at-arms, E. J. Ryan; Committee on Sanitation, James Meathe, Samuel Dixon, Hugh McDonald, J. H. Crumley, John Scheatur, Sr.; Arbitration Committee, J. E. Lee, George Lane, J. W. Partland, James Meathe, Benjamin Guiney, Charles Dulleau; Apprenticeship Committee, John McLaughlin, James Cameron, J. E. Lee.

GEORGE RAPLEYE, New Britain, Conn., stove dealer and plumber, has bought out the business of the Automatic Light Company.

THE EXAMINING BOARD OF PLUMBERS of Brooklyn, N. Y., held their first meeting for the year January 5. Commissioners Roche, Gately, Shevlin, Doody and Goff were present. After hearing the report of Clerk Leete regarding transactions of the board for 1893, which showed a good balance in the hands of the city treasurer, they organized for 1894 by electing Chief Inspector of the Department of Health William J. Roche president, F. J. Gately secretary, James J. Doody treasurer, and reappointing George W. Leete confidential clerk.

A LARGE ADDITION will be built to the building occupied by Fleck & Bros., dealers in plumbers' supplies, at 44 North Fifth St., Philadelphia, Pa.

J. C. GREEN AND LEE CHURCHILL of New Berne, N. C., have formed a partnership for plumbing and tinning, and commenced the erection of a building for their headquarters.

THE WALLACE BROS. COMPANY of Lafayette, Ind., were incorporated recently, with a capital stock of $35,000. They will carry on a plumbing business and will contract for the laying of gas and water mains and sewers.

JAMES B. ALGER has sold his plumbing and steam fitting business on Bridge street, Great Barrington, Mass., to William A. Leonard, who has been in his employ. Mr. Alger has accepted a position as engineer at the Riverdale Cotton Mills.

AT THE ANNUAL MEETING of the Master Plumbers' Association of New Bedford, Mass., the following officers were elected: President, Frederick N. Gifford; vice-president, T. J. Gifford; secretary, Charles T. Maxfield; treasurer, Edward F. Penny.

T. F. MCCORMICK, Newport, R. I., has received the contract to supply the plumbing work at the new marine barracks at Coaster Harbor Island.

THE WATER COMMITTEE of the City Council of Jersey City, N. J., recently passed a resolution granting licenses to J. H. Campbell, W. H. Dickinson, Alfrend H. Wilson, H. Dorbrandt, M. D. Lilles, A. J. Jardine, B. J. Keilt and John McComb.

H. MARSHALL has leased S. Stern's store on the south side of the square at Lincoln, Ill., for two years and will move his plumbing stock there.

THE STATE CONVENTION of the Master Plumbers' Association of Ohio is to be held at Toledo, February 13 and 14.

THE FIRM of Knapp & Dillon, Massillon, Ohio, were recently dissolved, Mr. Knapp assuming the settlement of the business, with the expectation thereafter of retiring. Mr. Dillon will establish a shop at his residence and continue in business.

P. J. COLEMAN, Bristol, Conn., has removed his plumbing business from its location on North Main street into one of the stores in the new Linstead Block.

S. A. PECK, plumber, at Greenfield, Mass., has sold his business and stock of goods to S. J. Williams, who comes from Orange, and J. H. Knight of Athol.

THE Board of Plumbing Examiners of Haverhill, Mass., recently organized, with Dr. Croston as chairman and F. E. Sawyer, a well-known plumber, as secretary.

D. J. MALANE, a plumber of Binghamton, N. Y., has recently completed a fine job of plumbing in the block recently erected by Elliott Dauforth at Bainbridge, N. Y.

A FOUR-PAGE CIRCULAR is received from the Boston Paste Company, 46 Beverly street, Boston, Mass., devoted to the merits of Noah's improved machine paste, which they claim is used by plumbers extensively just the same as soil.

THE PORTLAND PAPERS of recent date publish the report of the Inspector of Plumbing, containing the following figures for the work done in the month of November:

Number of first inspections	115
Applications and permits granted	100
Water closets changed from direct to tank wash	50
Vaults removed	3
Final inspection and certificates issued	52

The report also refers to a number of places in Portland where the houses are in bad sanitary condition, particularly those built 15 to 20 years ago, in which the plumbing has not been altered, there being pan closets in the bathrooms and brick cesspools in the cellars. According to the inspector's report the owners and occupants of such houses are averse to making any changes, but it is to be hoped in the interests of sanitary science that if the conditions are as bad as he mentions they will be forcibly remedied.

THE ORDINANCE requiring plumbers to pass an examination and take out a license, adopted by the City Council of Richmond, Va., last September, has not been generally heeded by the plumbers, only two having conformed with its provisions at the first of the year. As a result several plumbers recently appeared before Justice Owens, to answer charges of violating the ordinance. They were discharged, as there was no testimony to show that they had done any work that would violate the ordinance, but stated their intention to become licensed as soon as possible.

THE MASTER PLUMBERS' ASSOCIATION of Cincinnati, Ohio, recently elected Louis Krouse president; J. J. Doud, first vice-president; J. A. Gibson, second vice-president; J. D. Sullivan, treasurer; George Miller, secretary, and A. J. Diehm, sergeant-at-arms. A banquet followed, at which President Krouse was presented with a gavel. Among those present were: Louis Krouse, James J. Doud, John D. Sullivan, George Mellor, A. J. Diehm, J. R. Gibson, F. E. Hopper, Thomas Canary, William Malden, B. Watterman, George W. Porter, A. Bollu, Robert Carroll, John Noonan, P. Ochlemmer, Thomas D. Lynn, Weber & Son, William A. Allison, William Attlessey, E. J. Nolan, William F. Wagner, J. H. Schonhoft, M. Burke, William Lawson, George Elzenhofer, James Manning, Sol Krouse, Charles Hicks, Albert F. Lorber, Mr. Carouthers of Louisville, Ky., and George Harrington.

PRESIDENT FINNERTY of the National Association of Master Plumbers has given notice that a meeting of the Executive Committee will be held in Boston, February 13, 1894.

THROUGH THE KINDNESS of E. J. Brady, 58 Warren street, New York. *The Metal Worker* received an invitation to the annual ball, given at the Central Opera House, by the master plumbers of New York on January 10. Though a light snow storm dampened the night the affair was in every sense a happy one.

The Metal Worker acknowledges an invitation, through the kindness of R. F. Brown, Roxbury, Mass., to the annual concert and ball of the master plumbers of Boston and vicinity at the Odd Fellows' Hall, Boston, on January 9. Though not present to participate in the highly successful entertainment, we know the Boston plumbers dispensed their hospitality with very enjoyable results.

THE PLUMBERS of Manchester, N. H., are agitating an action by the authorities to provide for an examining board of plumbers and the licensing of plumbers. Frank A. Lane and Rufus H. Pike are in sympathy with the movement.

D. L. YARRINGTON was the first plumber to obtain a permit to open a street in the city of Derby, Conn., under the recently passed law.

J. A. HUBLEY has retired from the firm of Longuiel, Hubley & Co., tinsmiths and plumbers, at Halifax, Nova Scotia, and the business will be carried on by Rupert W. Longuiel, under the title of Longuiel & Co.

Essays for the Annual Convention.

The following letter is being sent to the various master plumbers' associations by the Essay Committee of the National Association of Master Plumbers:

The Essay Committee of the National Association of Master Plumbers, appointed by the National Executive Committee at the last annual convention, respectfully invite your association, or a member of it in his own name, to prepare an essay for presentation to the convention to be held in the city of Detroit in June next.

The subject should be a practical question relating to the progress of the trade and the future advancement of it; explanation and criticism of new devices; special requirements for the supply of water and the skill employed by the plumber in the distribution and protection of it; method of house drainage and disposal of waste, adapted to meet the peculiar condition or situation; and the best plan for organization of master plumbers' associations and the proper limit of their action, would be subjects of particular interest.

It is necessary that the essay be placed in the hands of the committee not later than May 15, 1894.

Chicago Master Plumbers.

A large and enthusiastic meeting was held by the Chicago master plumbers, at their rooms, 197 Madison street, Monday afternoon, January 8.

The following officers were elected to serve during the year :

President, Paul Redieske.
Vice-president, Thos. Conway.
Secretary, Alex. Murray.
Treasurer, P. Sanders.
Sergeant-at-Arms, G. A. Larson.

As the Executive Committee is to consist of the above officers, retiring president and three other members, the following were elected to serve on the committee : P. M. Murphy, C. C. Breyer, Jos. B. Breem and the retiring president, T. P. Culloton.

The revised constitution and by-laws, as recommended by the Executive Committee, were duly adopted.

At the conclusion of the business meeting the members were regaled with a banquet, and speech making followed until a late hour.

Philadelphia Master Plumbers' Association.

The annual meeting of the Philadelphia Master Plumbers' Association was held at the Builders' Exchange, in Philadelphia, on Thursday evening, the 11th inst., the president, John E. Eyanson, occupying the chair.

After routine business a communication was read from the Journeyman Plumbers and Gas Fitters' Protective Association of Philadelphia, in which they express their belief that the Master Plumbers' Association is actively interested in the advancement of the plumbing trade and willing to co-operate in any movement to establish laws that would eventually place the trade in a position to which its importance among the industrial trades entitled it. In this belief they set forth the objects of their association, in order to give the master plumbers an insight into the work proposed to be undertaken by the journeymen, such objects being found in the constitution of the Journeymen's Association. The injury, both to the master and journeyman, by the absence of any uniform apprentice system was recognized, whereby so-called journeymen were turned out anything but competent mechanics, injuring the employer by inferior work and creating a feeling of distrust in the minds of the public, and it was the desire of the Journeymen's Association to bring to the notice of the master plumbers that great evil, and their hope that at no distant date they would hear of the Master Plumbers' Association taking some action in the matter.

The Journeymen's Association also recognized the injury to the employer by the journeymen doing work outside of working hours ; in other words, carrying on business to the detriment of the employer while employed by him during the day, and stated that their association would use its influence to discourage such practice. Attention was directed in the communication to the violation of Rule 1 of the Rules and Regulations of the Board of Health, by sewer contractors running drains from the sewer to the curb, and in some cases setting cesspools at the entrances of courts and alleys, there being no registered plumber responsible for the work. In this connection a resolution had been passed at a recent meeting, embodying the determination of the Journeymen's Association to use their best endeavors to adjust these grievances and to secure by State legislation a law making it compulsory for every journeyman plumber to pass an examination before a competent board of examiners, and, in case of failure, prohibiting him from undertaking any work on sewer, drain, soil or waste pipes, or vent pipes from same.

The communication was referred to the Conference Committee, and a reply was directed to be sent to the Journeymen's Association expressing the pleasure of the Master Plumbers' Association to learn of their willingness to co-operate with the master plumbers in elevating the art of plumbing and other matters relating thereto. In regard to apprentices the association, as a body, did not recognize any boy who left his employer for the purpose of obtaining higher wages from another master plumber ; and no member of their association would employ such a boy without the consent of his former employer, who in any case must be a member of their association.

The reply fully explained the position of the Master Plumbers' Association in regard to action on the suggestions contained in the Journeymen's Association's letter, and promised its support wherever practicable.

The special committee appointed to meet the Sub-Committee of Councils on the Ordinance of Councils for regulating the issue of permits for the opening of all paved streets and roads reported progress. The ordinance is as follows :

SECTION 1. *The Select and Common Councils of the City of Philadelphia do ordain*, That before any permit shall issue to remove the pavement or break into any paved street or macadamized road, the person or corporation receiving said permit shall deposit with the treasurer of the city of Philadelphia a sum equal to twice the cost of repaving the approximate number of square yards of paving likely to be removed or broken, at the rate of $3 per square yard, as security that the said person or corporation shall restore said street to good order and condition, and maintain the same for a period of two years from the completion of the work, or to pay the expense thereof, as shall be determined by the Director of the Department of Public Works. Upon the completion of the work one half of said deposit to be returned, and the balance, or so much as has not been used by the said director in keeping the said street in good order, to be returned at the expiration of the said two years.

SEC. 2. In all cases where the city shall do municipal work, directly or by contract, in any of the streets paved as herein referred to, it shall provide, if by contract, that its contractor shall *make* the deposit mentioned in section 1 hereof, and if by pay roll that it will restore the paving and maintain the same for a period of two years, the date of making such repairs to be of record: *Provided*, That permits to remove the pavement or break into any paved street or macadamized road shall cost $2.

All ordinances or parts of ordinances inconsistent herewith be and the same are hereby repealed.

The meeting then proceeded to the election of officers for the ensuing year, when the following were declared elected : President, John E. Eyanson ; vice-presidents, George F. Uber, Samuel W. Barnes, Frank P. Brown, A. G. Bond, G. W. Smith ; recording secretary, William S. Clark ; corresponding secretary, William S. Clark ; treasurer, William Harkness ; Board of Directors, John E. Eyanson, William Harkness, Charles L. Parmalee, William S. Clark, Albert M. Hicks, Frank P. Brown ; sergeant-at-arms, Samuel B. Fleming.

The members then adjourned to the exchange room, where a substantial supper was spread, and the remaindre of the evening was spent in social intercourse.

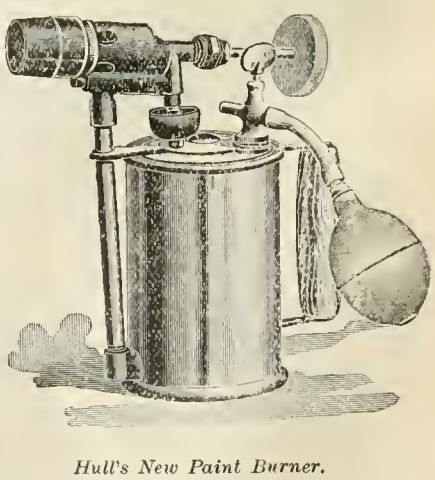
Alaska Handle for Drop Oven Door.

The Troy Nickel Works of Troy, N. Y., have added another to their long list of Alaska specialties and brought out a handle particularly adapted for use in connection with drop oven doors. It is substantially made, with that portion which comes in contact with the hand composed of coiled wire, thus rendering it cool and conveniently handled. The general arrangement of the parts of which it is composed and the means for connecting it to the door are so clearly indicated in the engraving presented herewith that a detailed description does not appear necessary.

Alaska Handle for Drop Oven Door.

Hull's New Paint Burner.

The accompanying illustration shows a new paint burner put on the market by M. L. Hull, 24 Broadway, Cleveland, Ohio, it being made inexpensive "to meet competition and the present hard times," according to the manufacturer's statement. The body is made of brass tubing, with cast brass top and bottom, all of bright brass. It is described as light, strong and substantial. The burner is the same as the maker puts on all his paint burners—that is, a cast iron nozzle, stuffing box to prevent leakage, wood handle, &c. The pump is the ordinary rubber bulb used on plumbers' furnaces, and is said not to be in the way when in use. The manufacturer points out that very little pumping is necessary, as the parts are so arranged that the contents will expand and produce a preasure without pumping. The handle is wood with brass brackets.



Hull's New Paint Burner.

The *Bankers' Magazine*, of London, comparing the values of stocks in 1893 with those of 1892, exhibits a shrinkage of over $300,000,000 in 334 leading securities.

ROOFING AND CORNICE.

Zinc Roofing.

The following description regarding the manner in which zinc roofing is laid abroad has been received from Theodore Philipp, Silver City, Idaho, and will be found of interest to many readers of *The Metal Worker:*

In answer to an inquiry in *The Metal Worker* some time ago, in regard to the method of laying zinc roofs abroad, I will give the readers a description of the same that it is hoped will be of practical use. In 1872 I was working for a firm in northern Germany, and in the town were 84 other tinshops, nine being at the head. In two years the firm I was with put on 16 zinc roofs for the Government and railroads under a guarantee that the roofs should not leak for three years. I had been working on a number of these roofs from start to finish, and had the fortune in 1881 to examine some of them. Although laid for some eight years, the roofs showed but a few small buckles, and the only change noticed was in the color, which was then black, caused by smoke and effects of the atmosphere.

When a zinc roof is to be put on, and the gutter is in the roof, as shown in Fig. 1, we would first place the gutter in position, bending in the inner edge 1 inch, as shown at A, and fasten to the roof by means of bent tin cleats 1½ inches wide, and nailed to the roof as at *a*. The finish at eaves can be made by nailing on strips of tin 2½ or 3 inches wide and any convenient length, allowing the strips to project over 1 inch, as shown at B in Fig. 1 or in Fig. 2. Over this strip the zinc can be bent as shown. Another method for securing the roof at eaves is shown in Fig. 3 at C, where the bent strip of tin extends under the roof boards. With the roof

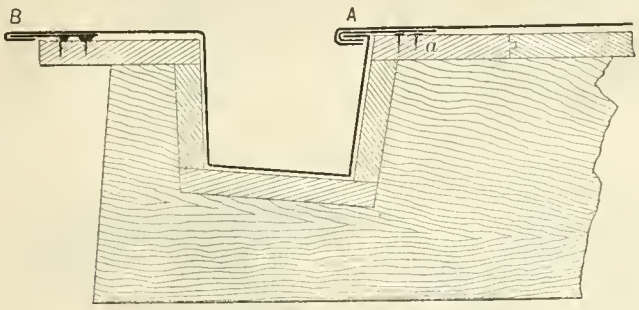


Fig. 1.—Method of Securing Roof at Gutter and at Eaves.

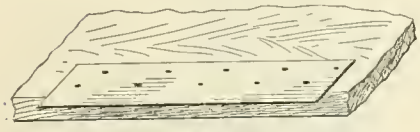

Fig. 2.—Strip of Tin Nailed at Edge of Roof.

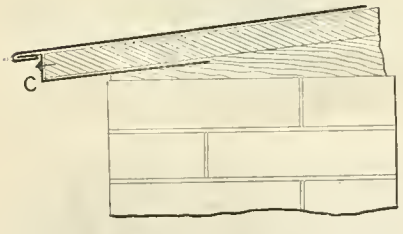

Fig. 3.—A Method of Securing Roof at Eaves.

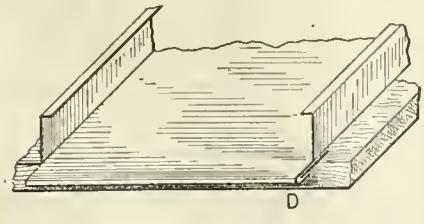

Fig. 4.—Sheet of Formed Zinc Applied to Roof.

Fig. 5.—Cleat Applied at End of Sheet.

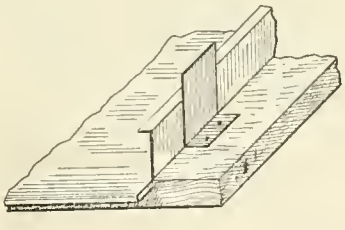

Fig. 6.—Cleat Applied to Zinc Sheet and Roof.

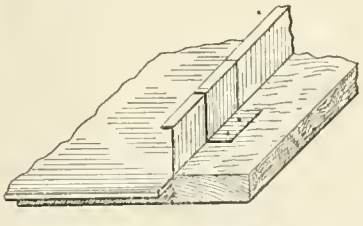

Fig. 7.—Cleat Bent Over Edge of Zinc.

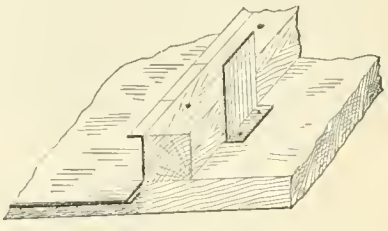

Fig. 9.—Cleats Placed Against Batten.

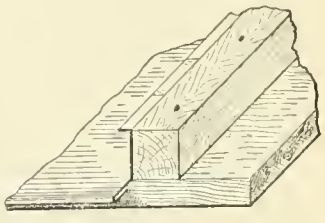

Fig. 8.—Batten Put in Place.

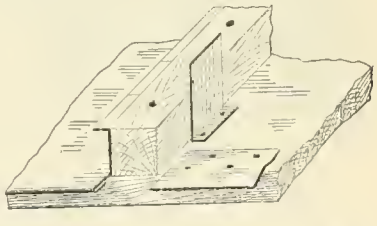

Fig. 10.—Second Strip of Tin Nailed at Edge of Roof.

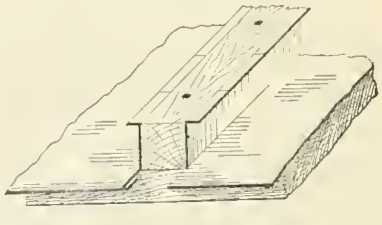

Fig. 11.—Second Sheet of Zinc on Roof with Cleats Bent Over.

ZINC ROOFING.

secured as shown at B and C hanging trough can be used.

The sides of zinc sheets are bent up 2⅜ inches and then over ½ inch, as indicated in Fig. 4. The lower edge of sheet is hooked over the tin strip, as at D, and the upper end turned over and cleated to the roof, as shown in Fig. 5, the cleats being about 8 inches long. This leaves the end ready to receive the next sheet, which is formed as above described and turned ½ inch for cross seams. Cleats are then nailed at the edge of sheet, as shown in Fig. 6, allowing them to extend 1 inch above edge of sheet, and bent over the edge, as in Fig. 7, thus securing sheet to roof without any nails being driven through it and so as to allow for expansion and contraction. Proceed in this manner until the first row of sheets is laid. Two-inch square battens are then placed against the sheets, as indicated in Fig. 8, and secured to roof by means of screws or nails, as may be desired.

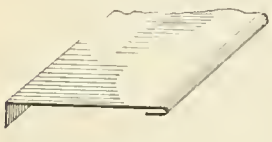

Fig. 12.—The Cap.

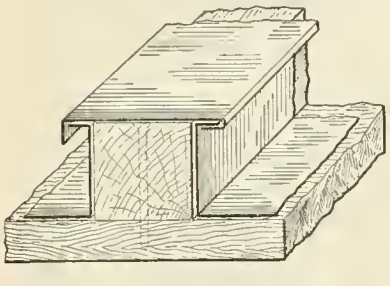

Fig. 13.—Cap Slipped in Place.

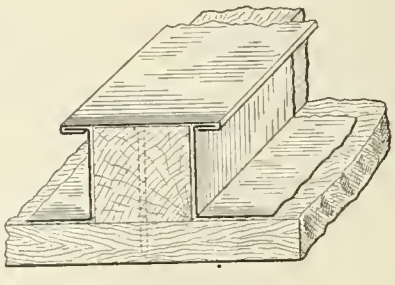

Fig. 14.—Edge of Cap Turned Over for Seaming.

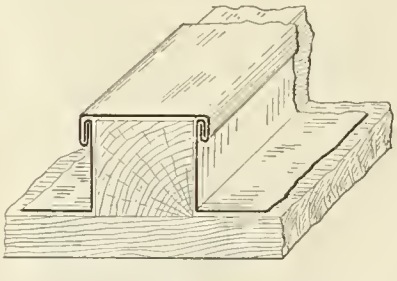

Fig. 15.—Cap Seamed Down at Sides.

ZINC ROOFING.

Cleats are then placed against the batten and nailed to roof, as shown in Fig. 9, and a strip of tin nailed to roof board, as in Fig. 10. If so desired the tin strips can be placed first, and thus under battens, being convenient for fastening to when ends of battens are covered, by soldering over square zinc caps bent over battens to facilitate soldering. The second lower sheet is then laid on the roof, being placed against the batten, hooked over edge strip, and cleats turned over edge, as shown in Fig. 11. After the sheets have been laid, and soldered if necessary, the 2 inch perpendicular seams included, take strips of zinc—say 4 inches wide by 3 feet long—and turn the edges over, as shown in Fig 12, one edge being bent over and the other at right angles. The strips are then placed over the battens, as shown in Fig. 13, each strip being allowed to lap over the other at ends, so the joints can be soldered if desired. The edges of strips are then to be turned over, as indicated in Fig. 14, using the square stake and mallet for the purpose, when they can be double seamed, as shown in Fig. 15. By this method a tight roof can be put on, and one that with good workmanship and material can be guaranteed for five years with safety. No. 12 zinc should be used, although lighter may answer under some circumstances.

A Sheet Metal Dragon.

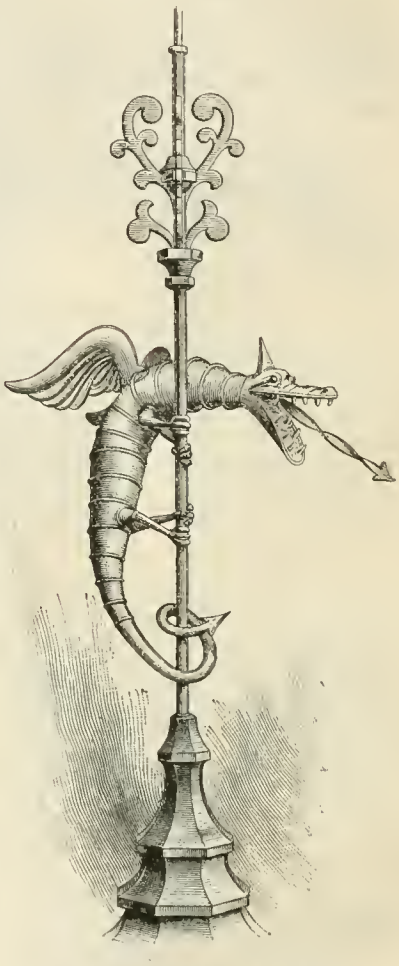
The subject of our illustration is a sheet metal dragon, made by L. C. Caul, Beeville, Texas, and reproduced from a photograph sent to us with the following description:

The design was furnished by G. F. Barber, an architect, of Knoxville, Tenn., and was on a scale of 3 inches to the foot. The dragon is made of No. 26 galvanized iron and mounted upon a 1¼-inch galvanized rod, and projects above the top of house tower 8 feet. It is attached to said rod by steel rods coming through the legs in such a manner as to permit it to revolve with the wind, thereby forming a weather vane. The steel rods entering the legs are met by a flat piece of steel 1¼ x ⅝ inches the shape of the back to which it is fastened by screws, through the back, which serves the purpose of strengthening the whole fabric. The dragon from tip of tongue to dart on end of tail measures 12 feet, and is 9 inches in diameter at largest part of body. The length of time occupied in making it is impossible for me to state, as during the time I was at work I was frequently called off to do other work, which interfered with steady work upon his dragonship. Work in my line, tin and galvanized iron cornice work, in these parts is yet in its infancy, as we are in that part of the great State of Texas that is just now being developed and coming to the front. In a few more years these parts will emulate the large cities in their architectural designs. Already several public houses and banks have been built that are ornamented with iron fronts and galvanized iron cornices, &c.

FLASHINGS.

Some specialties in the shape of metal roofing will soon be placed on the market by W. H. Mullins of Salem, Ohio. The designs were invented by W. R. Kinnear, president of the Kinnear & Gager Company, Columbus, Ohio.

J. H. Eller & Co., manufacturers of iron and steel roofing, Canton, Ohio,



A Sheet Metal Dragon.

state that their business, which was established in 1887, has increased in volume from 75 tons to 1000 tons per year. The extension has not been confined to any particular territory, as new customers have been found in all parts of the United States.

Rhodes, Dickelman & Co., Forest, Ohio, report that they have manufactured and sold about the same quantity of iron and steel roofing during last year as they did in 1892. Their output, including a line of galvanized specialties, has reached 600 tons per year, and their business has held up well during the off year, 1893. In addition to their line of staple goods they manufacture four styles of patented standing and double seam roofing.

The Cambridge Roofing Company, Cambridge, Ohio, report that their large output during the early months of 1893 has kept their average up to previous years. During the closing months and up to the present time business has been somewhat dull, but they are able to keep their force employed filling the wants of customers of long standing.

In spite of the severe business depression existing last year the business of the Central Expanded Metal Company, Pittsburgh, Pa., manufacturers

of expanded metal lathing and fencing, was considerably larger during 1893 than for the preceding year. In Eastern cities the demand for expanded metal lathing has been particularly heavy. In the West the demand is also showing gains, and the outlook in general for the year upon which we have just entered is promising.

WE HAVE RECEIVED with the compliments of W. J. Burton & Co., Detroit, Mich., an attractive calendar for the new year. It consists of a heavy piece of card measuring 10¾ x 14 inches and is provided with a metal eye at the top for hanging it up within convenient reach. The upper portion of the card is embellished with a picture by Detaille entitled "The Soldier's Dream." Below this appear in bold black letters the name and address of the company, with the statement that they manufacture metal cornices, ceilings, skylights and shingles. The 12 leaves for the months of the year are attached to the bottom of the card and give in addition to the usual statistics the various phases of the moon.

A POSTAL CARD with a grotesque sketch on the back of it is sent out by the Victor Mfg. Company, Newburyport, Mass., and calls attention in its way to the Victor roofing cement.

WE ARE INDEBTED to the Canton Steel Roofing Company, Canton, Ohio, for a very neat and serviceable calendar for the current year. It is not of undue size, nor of overgorgeous decoration, but is a simple desk calendar that will be useful to all who receive it. It is a leather frame, 6 x 4½ inches in size, with an eyelet for hanging up; the center of the frame being cut out, showing the monthly card calendar, there being a package of 12 in the leather pocket.

N. A. HALDEMAN & Co. of Philadelphia, manufacturers of corrugated painted and galvanized steel and iron roofing, have sent out to their friends a handy little pocket bank bill case. It is made of Russia leather, with a buff leather lining, and the firm's card appears in gold lettering on the inside flap.

THE numerous friends and acquaintances of James A. Miller will be interested in the news of his marriage, which was celebrated at Chicago on the 6th inst. The bride's name was Miss Martha Hall Shorey.

Herculean efforts are being put forth in New York City to meet the prevailing distress among the poor. The improvements decided on on the North River front and in Central Park are to be hastened, in order to afford work for the unemployed. Similar arrangements are being made by the municipal governments of other large cities where the distress is most acute; and the organized benevolence of private citizens is strained to the utmost to meet the pressing calls upon their charity. It is a hard winter, truly, for the majority.

Sir Edward Watkin, the English railway magnate and promoter of the English Channel tunnel, the great Watkin tower—now rising near London—and other gigantic schemes, is now actively engaged in pushing a project for cutting a canal across Ireland, from Dublin to Galway Bay, in order to shorten the route from England to the United States.

National Iron Roofing Association.

(By Telegraph.)

THURSDAY MORNING.

The National Iron Roofing Association met in St. Louis on Thursday morning, at 10 o'clock, in the Southern Hotel, with President C. H. Conner in the chair.

The following delegates were present:

T. C. Langenbach, Berger Mfg. Company, Canton, Ohio.
C. Holbrook, Canton Steel Roofing Company, Canton, Ohio.
G. H. Needham, Garry Iron & Steel Roofing Company, Cleveland, Ohio.
J. A. Topping, Ætna-Standard Iron & Steel Company, Bridgeport, Ohio.
James G. Battelle and
James Hicks, Cincinnati Corrugating Company, Piqua, Ohio.
A. L. Andrews, Globe Iron Roofing & Corrugating Company, Cincinnati, Ohio.
H. P. Lloyd, and
G. M. Verity, American Roofing Company, Cincinnati, Ohio.
Chas. Aldrich, and
R. B. Whittemore, Jr., American Roofing Company, St. Louis.
R. J. Hyndman, W. G. Hyndman & Co., Cincinnati, Ohio.
C. H. Conner, and
E. H. Conner, Chas. H. Conner & Co., Louisville, Ky.
R. B. Miller, Jas. A. Miller & Bro., Chicago, Ill.
Alex. Glass, and
E. C. Ewing, Wheeling Corrugating Company, Wheeling, W. Va.
Gustav Miller, St. Louis Corrugating Company, St. Louis.
E. E. Souther, and
A. G. Souther, E. E. Souther & Bro., St. Louis.
M. H. Crittenden, M. H. Crittenden & Son, Minneapolis, Minn.
E. C. Brainerd, Columbia Corrugating & Mfg. Company, Niles, Ohio, and Chicago, Ill.

The president's report was read and proved to be an interesting document. He reviewed the work of the past year and referred to the depressing effect which the panic had on general business during the last half of the year, and ventured the assertion that the iron roofing trade would compare favorably with any other line of business. He also made the statement that notwithstanding the innumerable failures which were recorded during the year 1893 not one roofing concern was included in the list. This is an excellent showing, and President Conner took occasion to congratulate the delegates on the excellent record made. He also recommended the adoption, with such changes as the members might desire to make, of the report of the Executive Committee, by which the new United States standard gauge is adopted and adjusted to the use of the iron and steel roofing manufacturers. He closed his address with the hope that a closer union and a more effective and beneficial organization would be the result of the meeting.

R. J. Hyndman, secretary and treasurer, then read the reports of his respective offices. Under the secretary's report he stated that three members had been added to the association since the last meeting, namely Chattanooga Steel Roofing Company, Chattanooga, Tenn.; Columbia Corrugating & Mfg. Company, Niles, Ohio, and Chicago, Ill., and O. K. Harry, Dallas, Texas. He reported that a correspondence had been kept up during the year with manufacturers outside of the association, and these accessions were the result of his labors.

As treasurer he reported a balance on hand, and that the association was free from debt.

J. G. Battelle, chairman of the Executive Committee in his report referred to the fact that the manufacturers of galvanized iron had already adopted the United States standard gauge, and urged the National Iron Roofing Association to do the same. At the October meeting a new price-list was compiled on painted roofing and siding to conform to the new United States gauge, which list Mr. Battelle stated was in the secretary's hands and would be submitted to the members for their final action.

The special Committee on Freight Rates, &c., reported that the effort to secure special classification on roofing tools did not succeed. On conductor pipes, elbows and fittings a reduction of one classification was secured. The general Freight Committee had nothing special to report.

AFTERNOON SESSION.

The important business of the afternoon was the adoption of a scale of prices to conform with the United States standard gauge.

This measure met with the unanimous approval of all the delegates.

The election of officers for the ensuing year resulted in the choice of the following:

President, E. E. Souther, St. Louis.
Vice-president, T. C. Snyder, Canton, Ohio.
Secretary and treasurer, R. J. Hyndman.

The Executive Committee appointed by President Souther is as follows:

Charles Aldrich.
J. G. Battelle.
W. T. Graham.

The midsummer meeting will be held at Niagara Falls, and the next annual meeting will be held in Cincinnati, on the second Thursday in January. Adjournment followed.

The evening was given over to the banquet tendered to the association by the St. Louis members at the Mercantile Club. The banquet room was beautifully decorated and about 65 sat down to enjoy the following:

Menu.

Blue points, half shell.
Sauterne.
Cream of asparagus.
Amontillado sherry.
Celery, olives, radishes.
Red snapper. Chambord.
Potato croquettes.
Sauterne.
Supreme of chicken à la Toulouse.
Peas à la Anglaise.
St. Julien.
Punch à la cardinal.
Mallard duck, fried hominy.
Lettuce.
Fruit, cheese, café noir,
Moet and Chandon.
Brandy.
Cigars.

Toasts.

The toasts of the evening and those who responded to them were as follows:

"Welcome".....Chas. Aldrich, St. Louis.

"Response".....C. H. Conner, Louisville, Ky.

"Our Guests"....E. E. Souther, St. Louis.

"The Rolling Mills and the Iron Roofers" W. T. Graham, Bridgeport, Ohio.

"The Past, Present and Future of our Trade".....G. E. Needham, Cleveland, Ohio.

"Co-operation and Association," H. P. Lloyd, Cincinnati, Ohio.

"The Trade Press".....C. H. Burton, St. Louis.

"Pot Pourri".....Jas. Hicks, Piqua, Ohio.

The banquet ended the eighth annual convention of the National Iron Roofing Association.

Sheet Iron Association.

The regular annual meeting of the Association of Iron and Steel Sheet Manufacturers was held in the *Times* Building, Pittsburgh, on Tuesday, the 9th inst The attendance of members was very large and considerable business was transacted. An election of officers was held which resulted as follows:

J. G. Battelle of the Piqua Rolling Mill Company, Piqua, Ohio, president.

W. T. Graham of the Ætna-Standard Iron and Steel Company, Bridgeport, Ohio, vice president.

John Jarrett, secretary and treasurer.

An Executive Committee was also appointed consisting of W. T. Graham and B. L. Caldwell of Ætna Standard Iron & Steel Company, Bridgeport, Ohio; N. E. Whitaker of the Whitaker Iron Works, Wheeling, W. Va.; B. F. Jennings of Jennings Bros. & Co., Limited, Allegheny, Pa., and W. C. Cronemeyer of the United States Iron & Tin Plate Mfg. Company, Demmler, Pa.

A resolution was adopted appointing John Jarrett and W. C. Cronemeyer a committee of two to watch after the tariff interests of the members, and at a suitable time both of them will appear in Washington and give testimony as to the probable effects the passage of the Wilson bill in its present scope would have upon the iron and steel sheet industries represented in the association. At the conclusion of the meeting of this association an informal meeting of the Association of Galvanized Sheet Iron Manufacturers was held, but no action of importance was taken.

Practical Application of the Pyrometer.

The growing necessity of uniformity in the quality of iron or steel products, says *The Iron Age*, has caused a closer study of scientific phases when metal of specified ductility is required. Old methods of judging by the eye are fast becoming obsolete, and with the increasing use of the pyrometer to ascertain and regulate temperatures of furnaces, the old secrets of managers and others, who have passed them from one generation to another, do not possess their former value.

The pyrometer is by no means a modern instrument, but its utility and value are being daily demonstrated. In annealing malleable castings, sheets of iron and steel and other iron and steel products it is required that a certain temperature be maintained in the furnaces for a given number of hours to produce a desired result. To accomplish this it has hitherto been the custom to train men in charge of furnaces so that they could make a tolerably accurate guess regarding the temperature by withdrawing a stopper and peeping into the furnace. This was a method full of uncertainties, and to make results more positive the pyrometer is now fast coming into general use.

For the benefit of those not having an available table at their command we print below the temperatures of iron, steel and other metals under various conditions according to the very latest scientific investigation:

Temperatures.

		Fahrenheit. Degrees.
Bright iron becomes	yellow	435
	red	500
	indigo	550
	gray	750
Tin melts		445
Mercury boils		660
Lead melts		612
Zinc melts		775
Silver melts		1,775
Copper melts		1,885
Gold melts		1,900
Iron bar, red in	a dark room	950
	ordinary office	1,075
	daylight, open air	1,450
Cast iron melts	white	2,075
	gray	2,220
Annealing	malleable castings	1,600 to 1,750
	sheet iron, No. 20 and lighter	1,600 to 1,700
	sheet iron, Nos. 18 to 10	1,750 to 1,800
Annealing glassware		800 to 1,000

	Centigrade. Degrees.	Fahrenheit. Degrees.
Bessemer Process:		
Running the slag	1,580	2,876
Running steel into ladle	1,640	2,984
Running steel into mold	1,580	2,876
Annealing furnace, ingot in	1,200	2,192
Ingot under hammer	1,080	1,976
Siemens-Martin Process:		
Gas from producers	720	1,328
Gas entering generator	400	752
Gas leaving generator	1,200	2,192
Air leaving generator	1,000	1,832
Fumes passing to shaft	300	572
End of fusion of charge, open hearth	1,420	2,588
Refining the steel	1,500	2,732
Running into ladle, first	1,580	2,876
Running into ladle, last	1,490	2,714
Glass furnace, between the pots	1,375	2,507
In the pots, refining	1,310	2,390
In the pots, working	1,045	1,913
Siemens, melted for casting	1,310	2,390
Blast Furnace, Gray Bessemer:		
Front of tuyere	1,930	3,506
At tapping	1,570	2,858

By preserving this table and carefully using a pyrometer those in charge of furnaces will avoid mistakes which are often very costly. It is frequently the case when new men are put to work at a furnace that they are entirely too energetic. The furnace is kept too hot and the material spoiled, annealing boxes are burned and general trouble results. On the other hand, an old employee, depending too much on his former success, may grow careless and keep the furnace at too low a temperature. The charge is drawn after the furnace is cooled down, the result is not satisfactory and the material has to go through the process a second time at the expense of the manufacturer. By using a pyrometer and enforcing a system of recording temperatures every hour these troubles can be avoided.

Tin Plate Trade Abroad.

J. L. Nash, of the firm of Henry Nash & Co., Liverpool, one of the most prominent tin plate houses in England, is paying a flying visit to this country. Mr. Nash speaks of the tin plate trade on the other side as being in the depths of depression. More than half the mill capacity is idle, and great distress exists among the operatives in some of the tin plate districts, owing to the long continued lack of employment. Yet, he says, the Welsh are characteristically hopeful and look on the brighter side, believing that better times are close at hand. The trade generally in England are anxiously awaiting developments in regard to tariff legislation in the United States, on the settlement of which the future of their business will mainly depend. Mr. Nash thinks that the duty proposed in the Wilson bill—namely, 1⅛ cents a pound—satisfies his countrymen in the trade, who would like to see it carried through. The manufacture of American terne plates has, he says, been a severe blow to that industry in Wales and has almost destroyed it. Hardly any terne plates are now shipped over here, and this material is rarely used elsewhere, except on a very limited scale in England for lining packing cases, &c.

SCRAP.

IT IS REPORTED that the Cleveland Tin Plate Company will build black plate mills at once, and that contracts have been placed for the machinery, the lucky bidders being a well known Youngstown concern.

THE PLANT of the New Castle Steel & Tin Plate Company, New Castle, Pa., is in operation to full capacity, with the exception of the tinning department, which temporarily suspended operations for lack of sufficient stock. The product of the sheet mill is large and the quality very satisfactory.

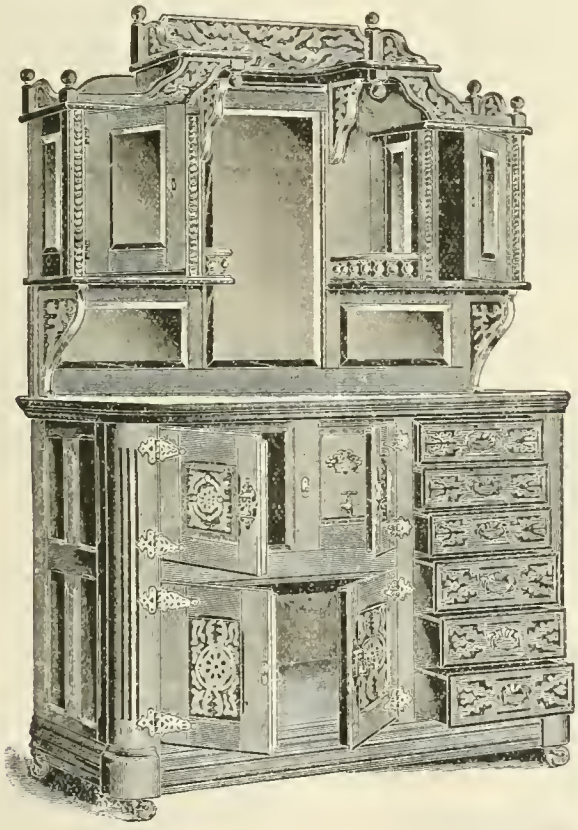
SECRETARY JOHN JARRETT of the American Tinned Plate Manufacturers' Association, leaves Pittsburgh in a day or two for the national capital, where he will address himself to the Senate on behalf of the association in regard to the new tin plate tariff.

EXPORTS OF TIN PLATES from Great Britain for the month of December were 23,000 tons, as compared with 26,000 in the previous month and 34,000 tons in December, 1892. Of this amount 14,000 tons were shipped to the United States, being a decrease of 1000 tons from the shipments of November and 9000 tons from those of December, 1892.

THE RETAIL STORE.

New Sideboard Refrigerator.

The accompanying illustration is a general view of a new sideboard refrigerator known as No. 038, put on the market this season by the Challenge Corn Planter Company, Grand Haven, Mich. It is a very complete and elaborate sideboard refrigerator, and is referred to as especially useful for a club house, though it makes a convenient dining room sideboard as well. One



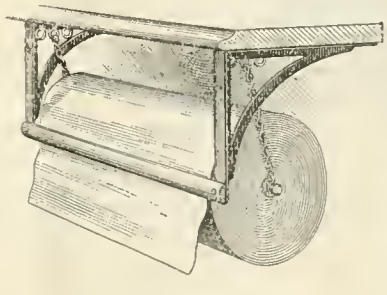
New Sideboard Refrigerator.

side of the refrigerator has drawers, as shown in the cut, for the storage of table linen, silverware and such articles, while on the other side is the refrigerator proper, which is made the same as in the other refrigerators of this concern. The water cooler, faucet and cup holder are in a recess, to which there is a door, as shown, so that they are entirely hidden when the door is closed. The cooler itself is a drawer which can easily be taken out and cleaned the same as any ordinary dish. The sideboard top has two cabinets, with glass panels in the ends and glass doors in front for the display of bric-a-brac, &c. Between these cabinets is a large French plate mirror. The wood is elaborately carved, as shown, and the trimmings are of bronze, while the whole is furnished with patent casters, floor plates and locks.

Charles B Nash, a prominent stove dealer in Portland, Maine, died on the last day of 1893 at the age of 58 years. He was a native of Raymond, and was the last of five brothers, four of whom were for years prominent in the retail stove trade. We understand that for 33 years the late Mr. Nash occupied a store on Fore street, where he conducted an extensive business.

A Novel Roll Paper Holder.

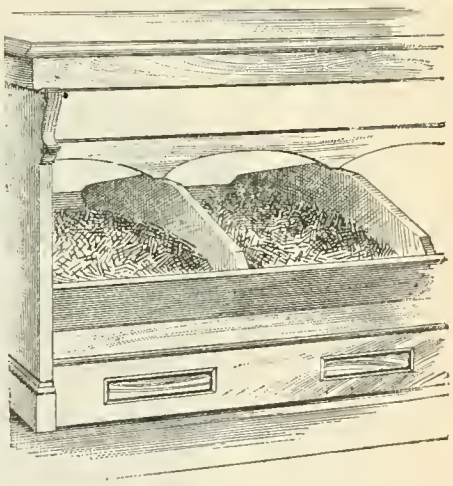
To avoid marring a handsome counter top of quartered oak by putting a paper holder on it, Widenor Bros. of Belvidere, N. J., made one to be placed in the rear of the counter, as shown in the accompanying cut. The material required for the device consists of a pair of 5 x 6 plain shelf brackets; a piece of $\frac{7}{8}$ inch half oval iron, three inches longer than the paper roll; two $\frac{3}{4}$ x $\frac{3}{16}$ inch stove bolts; two pieces of No. 10 jack chain, each 4 inches long, and six No. 108 screw eyes. The cost of these is put at 10 cents, and about an hour's time was required to construct the holder. A hole was drilled at each end of the half oval iron and countersunk to receive the stove bolts. The iron was bolted to the end of each bracket to form a cutter, and the brackets screwed to the underside of the counter at the proper distance apart. The screw eyes were put into the counter at the inner edge of the brackets, three in a row; and to corresponding eyes on each side the pieces of chain were hung. A wooden roller with a 1½ x $\frac{3}{16}$ inch oval head rivet in each end was put through the center of the roll paper; and on the rivets the chains were hooked. As the paper roll becomes smaller, the chains are hooked into eyes nearer the front, thus always keeping the roll swung against the cutter with sufficient force to allow of tearing the paper off. The holder may be put under any part of the counter which is most convenient: the counter in the illustration is cut off to show the holder to the best advantage.



A Novel Roll Paper Holder.

Double Nail Bins.

We give herewith an illustration of Nail bins used by Frank Alexander & Co., Staunton, Va. They are located under two 20-foot counters, and are open on both sides. Our correspondents consider this arrangement advantageous, as Nails can be weighed from either side, and customers can select the Nails from their side of the counter better than they can describe what they want. Each bin contains two kegs of Nails, and the space between the bin and counter is sufficient to allow a keg of Nails to be thrown in, thus saving the trouble of first emptying them into a scoop. These bins the firm consider more convenient than any other design they have seen. It is suggested that if desired the bins can be made smaller, or that each bin may contain two kinds of Nails, the sizes being separated by a partition running lengthwise of the bin.



Double Nail Bins.

The Darling Filters.

Darling Filter Company, 26½ South Water street, Cleveland, Ohio, are offering the filters represented in the accompanying cuts. The Self Cleaning filter, shown in Fig. 1, has a glass casing, which is used where the water pressure is not over 75 pounds to the square inch; where more than that a nickel casing is used. The manufacturers state that the filter never has to be taken apart to be cleaned and that a feature peculiar to this filter is the forcing of the cleaner against the porous tube, so that by revolving the goose neck at the top of the filter a few times the tube is cleaned. One of the valves at the bottom of the filter is for carrying off the accumulated dirt and the other valve is for supplying the water to be filtered. The point is made that through the glass casing the dirt can be seen accumulating on the porous tube and also disappear in cleaning. The filter has been tested in Cleveland, St. Louis, Kansas City and at other points. The report of an analytical chemist at Kansas City states that a chemical analysis and microscopical examination showed that all suspended matter, as well as a portion of the organic matter, had been removed and that the water was free from microbes existing in the unfiltered water. The manufacturers claim that the filter is absolutely germ proof, that it will filter from 10 to 15 gallons of water per hour, and that it is cleaned in three minutes, without shutting off the water or taking out the tubes. Fig. 2 shows the Little Darling filter, which is taken apart for cleaning. This is done by simply unscrewing the screw at the top of the filter, lifting the nickel casing out and brushing off the porous tube. The Little Darling is shown in Fig. 3 attached to a water cooler. The cooler is provided with two reservoirs, one for ice and the other to hold 3 gallons of filtered water. It also has an automatic valve for closing the filter when the reservoir is full. This arrangement is designed for use where a large quantity of filtered water is required.

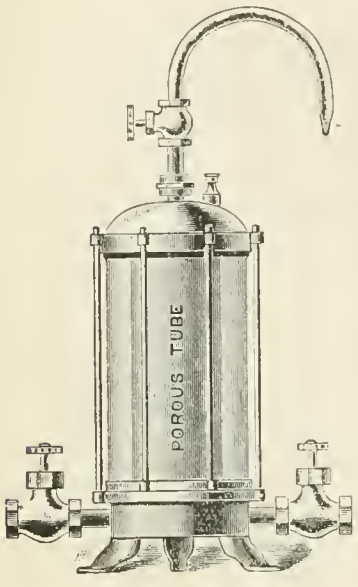


Fig. 1.—Darling Self Cleaning Filter.

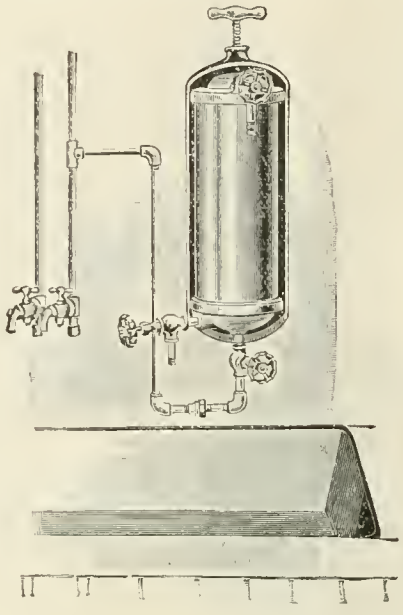

Fig. 2.—Little Darling Filter.

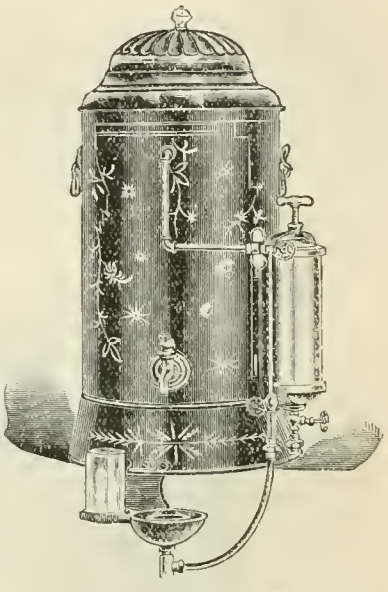

Fig. 3.—Little Darling Filter and Water Cooler.

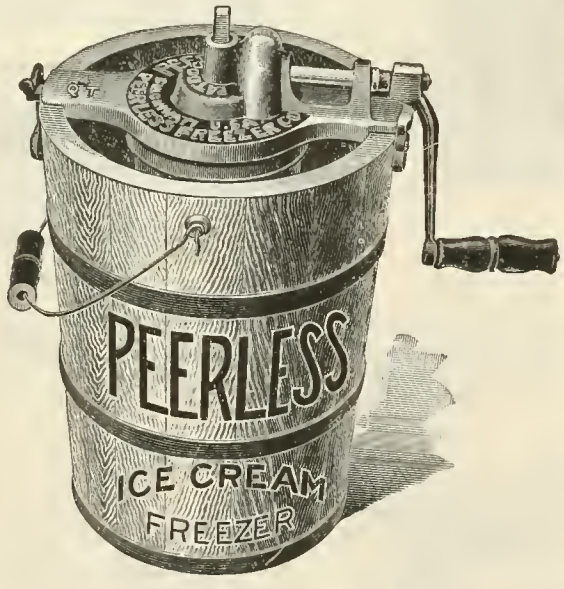


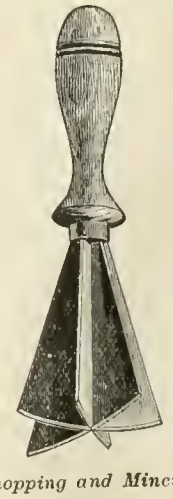
New Peerless Ice Cream Freezer.

New Peerless Ice Cream Freezer.

Peerless Freezer Company, 28-38 East Ninth street, Cincinnati, Ohio, J. C. McCarty & Co., 97 Chambers street, New York, agents, have improved their freezers as represented herewith. Besides covering the gearings, additional leaves have been placed on the dasher frame, which, it is explained, disintegrates the cream more rapidly and thoroughly, and provides for the better circulation of air through the same. The middle wheels, instead of being cast separately, as formerly, are now cast in one piece and in such form as to provide an automatic reservoir for receiving oil drippings. It is stated that its present form also makes the apparatus salt water or oil proof—that is, permits neither of these elements to enter into the cream chamber. The standard heretofore passing through the cast tub top now engages with the middle wheel, leaving no opening whatever for salt, water or oil to get through into the cream. The manufacturers claim that the freezer is full size, that it has as many motions as are practicable, that the whole machine now requires fewer parts, is easily put together, less liable to get out of order, and that the tubs on each size of the freezer are unusually heavy.

Victor Chopping and Mincing Knife.

The cut here shown represents the Victor chopping and mincing knife, being offered by the Clauss Shear Company, Fremont, Ohio. The blades are of such a quality of steel as to hold an edge, and may be sharpened with a file when necessary. The position of the handle, it is stated, is such as to make chopping easy, the knife doing a large



Victor Chopping and Mincing Knife.

amount of work in proportion to the labor expended. It will cut fruit and potatoes into neat pieces for frying and preserving ; one stroke giving, if desired, six equal pieces of fruit or potatoes. It is also recommended for making steak tender, by cutting the fiber and not bruising it. The manufacturers claim that the knife is strong, simple, cheap and durable, and that it is easy to clean and sharpen.

Columbia Washing Machine.

The Columbia washing machine, illustrated herewith, is put upon the market by the Richmond Cedar Works,

Columbia Washing Machine.

Richmond, Va. The washer is made of selected Virginia white cedar as best adapted for resisting the action of water, and is provided with heavy castings, all castings, hoops and trimmings galvanized to avoid rust, which stains clothes. The bottom and sides are corrugated on the inside of the machine, and, it is stated, the corrugations are so evenly tapered off where the bottom joins the side of the tub that no cracks are left for any fabric to catch in, nor in which dirt may collect. The point is made that the bottom is in the large end, to prevent clothes from wedging.

The Monarch Grate Guard.

The accompanying illustration represents a grate guard, introduced by the Cincinnati Mfg. Company, 211 Walnut street, Cincinnati, Ohio. As shown in Fig. 1, the guard is made from wire

Fig. 1.—The Monarch Grate Guard.

rod of No. 4 gauge, so formed and bent as to readily admit of its being placed in position over the top bar of a grate, as in Fig. 2, to which it adds a depth of 3½ inches. The loops in the guard are placed sufficiently close to each other to prevent the live coal from falling out. The guard is designed to provide an extra capacity for grates that are not deep enough to fulfill the requirements made upon them. The

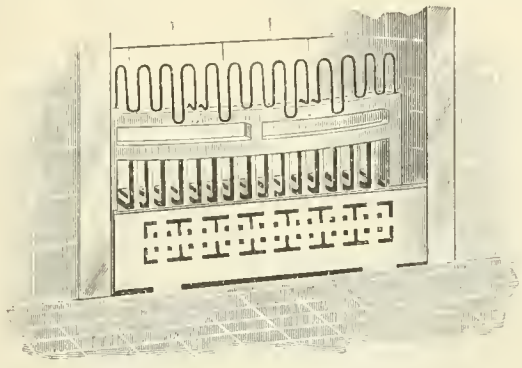


Fig. 2.—Grate Guard in Position.

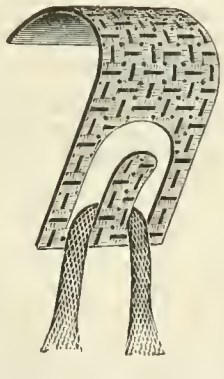
guards are made in four sizes, for 20, 22, 24 and 26 inch grates. The manufacturers claim that the guards are strong, light, durable and thoroughly practical.

Picture Hanger.

Julius Berbecker & Co., 65 Duane street, New York, are marketing the picture hanger or molding hook as here shown. These hooks are made in but one size and of one pattern, and it is claimed that they will fit any mold-

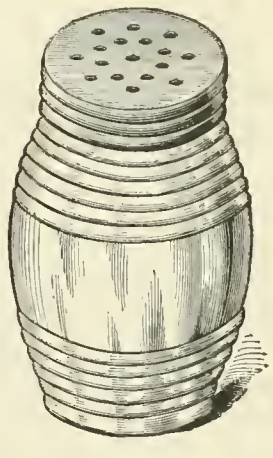


Molding Hook or Picture Hanger.

ing from 1 to 2 inches. One of the principal features to which attention is called is their adaptability to almost any molding, and at slight cost. They are made of steel, brass finished. Another point emphasized is that should a wire break or become detached the wire will not draw through or allow the frame to fall.

Tack Salt Shaker.

Chicago Tack Company, 7700-7800 Woodlawn avenue, Chicago, are putting up carpet tacks in shakers, as shown in the accompanying illustration. The shakers are of crystal glass, with metal tops, perforated for salt or pepper. The salt and pepper shakers are the same, except that the perforations in the cap of the pepper are smaller than the salt. The shakers are designed for table use when emptied of tacks. The goods are packed, half salts and half peppers, in half gross cases, filled with carpet tacks made by the company which they refer to as being of fine



Tack Salt Shaker.

quality. The packages are designed to retail at 5 cents each.

THE SIXTH DINNER of the Hardware and Metal Trades of New York will be held under the auspices of the Hardware Club at Sherry's, on Tuesday evening, February 27. Tickets, at $5 each, can be obtained from A. D. Clinch of Underhill, Clinch & Co., 94 Chambers street. The opportunity of securing tickets is first offered to the members of the Hardware Club, and the committee in charge of the dinner are desirous of hearing as early as possible from those who are intending to purchase tickets. The number of tickets issued will necessarily be limited, so that it will be wise for those who desire to attend the banquet to send in applications at an early day. It is hoped that the gathering will be a representative one, as has heretofore been conspicuously the case, and that the trade outside of the city and throughout the country will be present in gratifying numbers.

OHIO LANTERN COMPANY, Tiffin, Ohio, are getting out a new side lift Lantern, which they predict will prove a successful competitor with any similar goods now offered. A full line of their goods is carried in stock at their New York address, 81 Chambers street, W. W. Pryor & Co., agents.

STOVE TRADE NOTES.

Stove Trade Reminiscences.

A correspondent, who evidently reads with a great deal of interest what our old friend "Jeems" has to say, sends, under the *nom de plume* of "Old Mack," the following letter:

I have always taken great interest in the effusions of "Jeems," your valuable correspondent, and in *The Metal Worker* of January 6 he gives the sayings of "ould Tim," which he thinks should be buried with the past. Not so, think I, for I stand by Tim because I am of the old stock. While hundreds of young men have come to the front in the stove business, I do not see that that should be a proper cause to switch off the fine old ones or their expressions, altogether. Now let "ould Tim" and old Mack just sit down and compare a few notes of 50 years ago about the stove business in New York City. Tim, do you recollect when J. L. Mott kept a store at 23 Bowery, for if you do not, just come down to Cliff and Beekman streets, and see what has come of it? If my recollection is correct I am not at fault in pointing out where the acorn was planted from which sprung this great oak. About Tim's working for Cunningham in Water street, that may be so. All Mack's recollection of Cunningham was when he kept a stove store in Grand street, just east of Joshua Underhill's place of business. There was great competition between them in stove selling; and when one would throw in an extra pipe head the other would go one better, and so it came to pass that if the customer would stand out long enough, telling what the other store would do, he very likely would get a large portion of the tinware of the seller. About this time James put his saddle log stove on the market. Does Tim recollect that? No small vessel, in its galley, was complete without one of them. I might go on with the questioning indefinitely, but *The Metal Worker* might get tired, as "Jeems" seems to have quit twaddling about stoves, &c., as they appeared 50 years ago.

The Boynton Furnace Company.

195 and 197 Lake street, Chicago, are issuing a very handsomely printed card referring to their remarkably large line of heating apparatus. They are prepared to meet the demands of the trade for hot air furnaces and low pressure steam and hot water heaters to suit any requirements. The card illustrates some of the leading types of their furnaces, of which they make over 100 styles and sizes, and also presents illustrations of steam and hot water heaters. One side of the card is devoted to a statement of the comparative and approximate heating capacity of the Boynton Furnace Company's coal and wood furnaces. It often happens that information is specifically desired as to the size and style of furnace adapted to economically and efficiently heat a house of a certain size, or a number of schoolrooms or a large single room, store, church or public hall. Such information is here given, arranged in tabular form, so that it is a comparatively easy matter to select the style and size desired. These tabulated statements are based on the experience of many years in the use of the company's apparatus under all conditions, and are therefore not merely theoretical estimates. The card will be found worthy of preservation by the trade for frequent reference.

The Chicago branch of the company is under the management of J. H. Manny and C. E. Manny, through whose untiring efforts their business steadily increases.

ODD PLATES.

We are indebted to the Troy Nickel Works, Troy, N. Y., for a copy of the 1894 catalogue of Alaska goods, which is being distributed to the trade. This is the thirteenth annual catalogue and price-list and in it the manufacturers state that they have added to their line many improvements during the past year. The Alaska line of specialties are referred to by the makers as "strong and durable, yet light and convenient to handle." These goods, as our readers are aware, have met with an extensive sale, not only in this country but abroad, and in the catalogue which the company issue for 1894 illustrations are presented showing the general appearance of the various styles turned out. All Alaska goods are fully covered by letters patent, and in offering them to the trade the Troy Nickel Works call attention to the following points: 1, that the "gooda will not become hot and impossible to handle;" 2, "they will not become loose and rattle," and, 3, in the knobs the tension of the spring locks the nut and prevents its turning and allowing the knob to become loose.

J. E. Allen, in former years connected with the New York store of Richardson & Boynton Company, has reentered the employ of that concern and assumed the management of their Boston store, at 94 Union street. Mr. Allen is well known to the trade and comes back to his first love with renewed enthusiasm and the good wishes of his associates.

W. F. Habicht is visiting the trade in Pennsylvania and Clark B. Smythe the trade in Virginia in the interest of Novelty stoves, Challenge Iceberg refrigerators and New Process and Splendid Novelty gasoline stoves, handled by F. M. Borden & Bro., Philadelphia.

George W. Gardner died at Troy, N. Y., Friday, January 5, in his seventy-seventh year. He was born in Canaan, Columbia County, and the greater part of his life was spent in the foundry business, he being for 17 years general manager for the Fuller & Warren Company, Troy, N. Y. He was afterward engaged in the manufacture of stoves on Green Island, near the city of Troy. Mr. Gardner was very ingenious and was the inventor of many little contrivances, which he used in his foundry work. He was a Mason, was an active fireman before the days of the Fire Department, and was a member of several volunteer companies.

Every stove plate foundry in the city of Albany, N. Y., is now shut down for the annual inventory and repairs, and this throws about 1000 men out of employment. Most of the foundries are said to have a large stock on hand on account of the poor trade caused by the general depression. Some of the smaller foundries, especially those doing job work, are running on short time. However, the proprietors are hoping for a brighter outlook soon.

"Jewel Gasoline Stoves" is the title of the 1894 catalogue which is being distributed to the trade by George M. Clark & Co. of Chicago, Ill. Its make up shows evidence of careful arrangement, the printing being neat, and the binding is in attractive covers. In offering Jewel gasoline stoves for the thirteenth time the manufacturers call attention to new features and improvements which have been incorporated in their lines for the season of 1894. The process stoves have been improved by the addition of a shield which is removable, protecting the brass tubes above the stove top; there is a large burner on the step of the step stoves and in the oven of cabinet ranges; a cast iron shield to protect the small tubes near the burner caps; a removable strainer wire at the filling funnel; the tank is finished in brass instead of copper; large nickel-plated Jewel name plate below the tank and a two-burner process stove made without step. In connection with single generator stoves, No. 85 is highly ornamented and has new oven doors, while No. 95 is made with a lower door. Among individual burner stoves there is a new line of Jewel juniors, a new line of Jewel-Acmes, while all Jewel junior and Jewel-Acme stoves are furnished with Jewel lay down safety tanks with brass bottoms. The Jewel junior and Jewel-Acme low stoves are listed with lay down tanks at the price of stationary tank stoves of last year. The Jewel goods are illustrated and described at great length, particular attention being given to the special features which are provided. In the way of stove furniture, ovens, cookers, waffle irons, toasters, flat iron heaters, broilers, &c., a varied assortment is presented.

"The Charter Oak Almanac for 1894" is the title of a 48-page publication which reaches us from the Excelsior Mfg. Company of St. Louis, Mo. In addition to a calendar for the year there is given an astronomical storm chart covering 12 months, together with astronomical phenomena, &c., for the period named. Scattered through the volume are illustrations of a varied character, while there is to be found more or less of that class of literature known as light reading. As the pamphlet is issued primarily for advertising purposes, it is natural to find that it has a great deal to say about Charter Oak stoves and ranges. Numerous receipts

for the housewife constitute another feature of the almanac, which will prove interesting to the recipient.

THE AUBURN STOVE FOUNDRY COMPANY of Auburn, Maine, have commenced the work of repairing the buildings recently damaged by fire, and it is the expectation to have the plant again in running opreation next month.

THE INDIANA STOVE WORKS of Evansville, Ind., have set aside from their profits the sum of $1000 to be used as a sick or accident fund for the benefit of their employees. Those who by reason of illness or accident are unable to work will be paid a certain weekly sum, the married men receiving $5 per week, unmarried employees $3 and apprentices $2. In order that all may be treated fairly it is stipulated that the benefits named are to be paid after the beginning of the second week of continuous illness. It is also understood that no employee shall be entitled to a benefit for illness brought on directly by, or attributable to, himself, or to accident or disability that may result from the transgression of any of the laws of the city or State. It is further atipulated that the sum of $1000 shall be the maximum amount to be paid in benefits during 1894, and "should the sum named be exceeded before the close of the year, the payments of any and all benefits shall immediately cease." The benefits we understand, are applicable only to those who have been in the employ of the company for at least one year. In the circular which the company have issued to their workmen, they state that they deem it best to exclude from the benefits named any transient helper, as it is their aim to benefit only their regular employees, and the hope is expressed of being able to so conduct their business relations as to enable them to operate their works by men whose names and faces will always be familiar and in whose advancement the company may ever take a deep interest.

THE ECLIPSE STOVE COMPANY of Mansfield, Ohio, will be represented on the road during 1894 by the following traveling salesmen, who will cover the territory named: C. A. Munsell, in Western New York, Western Pennsylvania and Eastern Ohio; J. S. Cadot, in Western Ohio and Eastern Michigan; M. J. Weldon, in Western Michigan and Indiana; W. J. McKay & Co., in Cook County, Ill.; B. H. Cook, in Northern Michigan; H. D. Bell, in Illinois; J. C. Bump, in Wisconsin; the Townley Stove Company, in Southwestern Indiana and Southern Illinois; Charles Baldwin, in Iowa, Missouri and Nebraska, and H. E. Cook, in Minnesota and the Dakotas.

THE ROUND OAK STOVE WORKS of Dowagiac, Mich., resumed operations the first of the year with a force of about 300 men.

THE STOVE FOUNDRIES in Taunton, Mass., have been closed recently for the purpose of taking account of stock and making necessary repairs. The Weir Stove Company and the foundry of O. G. Thomas are expected to resume operations shortly, but according to local papers there seems to be a doubt about the immediate resumption of operations at the plant of the Cobb Stove and Machine Foundry.

THE WROUGHT IRON RANGE COMPANY of St. Louis, Mo., have for some time past been making active preparations for their exhibit at the Midwinter Exposition in San Francisco, Cal. They also intend, in the course of the next few weeks, to open a branch store in the city named, so that they can ship their goods to that point by the carload and thus secure the advantage of better rates of freight than they would be able to obtain on less than carload lots.

THE GRANDER STOVE WORKS of Royersford, Pa., according to press dispatches, expect to resume operations in all departments of their works on January 20.

THE DANGLER STOVE & MFG. COMPANY, Cleveland, Ohio, furnish us with a copy of the illustrated catalogue and price-list of gasoline, vapor stoves and ranges, which has just been issued from the press. It is a volume of 48 pages, neatly printed and bound in colored paper covers. The side title is embossed in letters of old gold upon a black ground. The frontispiece is a bird's-eye view of the company's works, following which is an announcement to the trade. The volume is the fifteenth annual catalogue which the company have issued, and in it attention is called to new goods and improvements which have been incorporated in their leading specialties. The construction of the New Delight is referred to as being substantial, convenient and attractive, as well as greatly reducing the possibility of accidents. The company say they will continue to manufacture a full line of single generator and individual burner stoves with the new frame and design which has proven so popular; also high and low junior stoves, as well as half high, with lay down tanks. Directions are given for the care of gasoline stoves, together with a telegraphic code, price-lists, &c. The stoves are illustrated and described, and directions for operating the Dangler process stove and lighting the Surprise burner are presented. The assortment shown is an extensive one, and is followed by stove furniture of interest in this connection. The Dangler radiator with the burner at the bottom of the center tube opposite a small door in front, and the Dangler gas range with water heater extension and step are features of the catalogue.

HENRY E. AND ARTHUR JANES, the senior and junior partners of Janes & Kirtland of this city, have returned from a month's sojourn among the wild woods of Maine, where all business cares were laid aside, and where, "roughing it" in true huntsman's style, they were both greatly benefited. We had the pleasure of a general and hearty invitation to call at their establishment, where they have on exhibition in one of the large plate glass windows two heads of the *Alces Americanus* or American moose. These animals stand 8 feet in hight and have antlers that spread 5 feet. They are very finely mounted, and prove the greatest attraction ever seen in the local stove district.

THE FAVORITE STOVE & RANGE COMPANY, Piqua, Ohio, favor us with an advance copy of their spring supplement, which is a beautiful example of the printer's art. The front cover is embellished with a combination design wrought in colors of delicate shade, and while largely typographical is rich and artistic. The matter includes the name and address of the company, a *fac simile* of their trade-mark and the statement that the spring supplement shows a new line of wood and coal and wood cooking stoves. Across the top of the cover is an oblong panel carrying a design consisting of sprays of flowers, birds and butterflies, while in one corner is the date 1894. In offering this supplement to the trade the company express their appreciation for past favors and refer to the additions made to their manufacturing capacity during the year 1893. These included a large engine house, a 200 horse power Corliss engine, two boilers of 125-horse power each, new japanning ovens, a building 50 x 200 feet, molding floors 100 x 112 feet, together with considerable new machinery. The goods, which are illustrated in the supplement are known under the name Favorite, and are finished in first class style. All the latest improvements are incorporated, including those features which in the past have rendered the favorite line of stoves so popular with the trade. The construction intended for burning coal and wood is made in four sizes, with ovens ranging from 19 x 19 inches to 21 x 21 inches, water fronts being provided for all sizes. The Favorite, for wood only, is made in the same number of sizes as the one just referred to, with ovens of equal dimensions. The last page of the cover is devoted to a handsome bird's-eye view of the works of the Favorite Stove & Range Company, the entire depth of the buildings being 1270 feet.

THE FULLER & WARREN COMPANY, Troy, N. Y., favor us with special advance sheets for their 1894 illustrated catalogue, showing a new furnace made in 20 different modifications and sizes. This line of heaters has been brought out to meet the great demand for a powerful, simply constructed, easily regulated, low price hot air furnace. It is referred to as being economical in fuel, absolutely gas and dust proof, and as having large ash pit, chain dampers arranged so that the fires may be regulated from the floor above, steel dome and radiator, constructed of polished wrought steel, extra heavy, and all parts exposed to the direct action of the heat; clean out door for casing made extra large, and casing rings with patented device for bolting together. The entire furnace is said to be easily set up and operated. Attention is also called to the hot water heating attachment as used in connection with their furnaces. We understand that the company will soon issue to the trade their complete furnace catalogue.

JAMES LAWRENCE, bookkeeper for Sam S. Utter, has recently had the appearance of his counting room greatly improved by a new carpet and a brand new high polished mahogany desk. The surroundings are beautified with ornamental railing, bronzed in gold, and of a high order of finish. "Jimmy" is one of the most sociable of companions and has the faculty of knowing how to tell a good story. The genial Sam says he is one of the most accurate accountants in Beekman street. Jimmy has invented several short cuts in doing addition, known as the chain rule, by which four columns of figures may be added at once; also a new method of averaging and computing interest at any rate.

THE RINGEN STOVE COMPANY of St. Louis, Mo., have issued an 1894 catalogue of Quick Meal gasoline stoves, which they manufacture in great variety. The volume is of the usual size and style issued in previous years by this concern, and within the covers are found illustrations of goods which have been improved for the coming season's trade, as well as those which the company have recently placed on the market. The frontispiece is a general view of the company's new building on

Chauteau avenue, while in their address to the trade they refer to the sales of Quick Meal stoves for 1893, the figures being 71,316. The statement is also made that the 1894 line of Quick Meal evaporating stoves has been vastly improved in appearance and that all cabinets are now provided with a base, greatly enhancing the general effect. The backs have been beautified by the substitution for the somber black of marbleized panels and surrounding a pair of tile in polished brass frames. The dial plates, heretofore separate, are now combined in one nickel plated shield, which carries the number of the stove. All junior stoves have been provided with turn down tanks. A number of testimonials with regard to Quick Meal stoves are presented, after which we find illustrations of evaporating and single generator styles of Quick Meal goods. Special attention is invited to the Quick Meal torch No. 6, for gasoline, which is a recent addition to the company's assortment, and also to the Quick Meal paint burner, for gasoline, which has been brought out as a great improvement over all others. The handle is adjustable, turning loosely on the tank, so that the flame may be thrown in any direction without inconvenience in holding the apparatus.

We are indebted to the Phillips & Clark Stove Company of Geneva and Troy, N. Y., for a calendar of the same general make up as that which they sent out in the early part of 1893. It is in the shape of a card easel, to the lower portion of which is attached a calendar, diary and memorandum combined. There are seven spaces to a page, giving one for each day of the week, and ruled with lines for purposes of memoranda. A page is devoted to information of a useful character, such as rates of domestic and foreign postage. There are also given yearly calendars for 1894 and 1895. The upper portion of the card carries the name and address of the company, together with a *fac-simile* of their trade-mark. The arrangement of the calendar is such that it may be used as an easel on the desk, or it may be suspended upon the wall by a cord provided for the purpose.

J. B. Oldershaw of 628 North Eutaw street and Nos. 400–402 Druid Hill avenue, Baltimore, Md., is directing the attention of the trade to a stove possessing many interesting features of construction. Under the swinging dome or cover is a 7-inch boiler hole, which may be utilized for heating water or cooking, if necessary. This cover is back of the center and immediately over the direct flue damper. The base of the stove at the back is perforated for the purpose of admitting air from the floor to an air chamber, which is formed by a Russia iron half body extending from the sides and around the back. This construction makes an air chamber 2½ inches wide, which extends to the top of the stove. The air chamber is continued over the fire to the perforated front, on which there is a pipe collar and damper to suit with an ornamental top, the latter and the damper being movable. When used as a double heater the stove is provided with a pipe which is fitted to the collar on the fret work front and extending to a register in the floor above. When the damper is opened the entire back of the stove is brought into requisition to heat the room overhead. The heating pipe is in front of the center of the stove, and, it is claimed, does not interfere with the boiler hole or swing cover. The stove is referred to as being neither round, square nor oblong and as a new departure in construction and design.

The Aurora Vapor Stove Company of Cleveland, Ohio, favor us with a copy of a well arranged catalogue just issued by them relating to gas and gasoline stoves. The lines of goods covered are made under the name Aurora, the leading place being given to an evaporating range having two burners in the top and one in the shelf or step at the side. The stove has a cast iron top, front and base and drop oven door. Several sizes of Aurora evaporating stoves are shown, followed by the New Aurora range, provided with the company's hot generator and patent concentric burners on the top and shelf. The ovens are heated by double burners 18 inches long, cross slotted, the upper one being especially intended for baking and the lower one for broiling. The top, front, posts and base are of cast iron and the sides and back of cold rolled steel, all japanned, while the door centers are nickel plated. Both the ovens are asbestos lined. A variety of junior stoves are presented, together with special instructions relating to the Aurora evaporating stoves. The closing portion of the catalogue is devoted to Aurora gas stoves, of which a large line is shown. The New Aurora furnace, North's ventilated broiler, Aurora ovens and sad iron heaters are illustrated and described. There is also presented a telegraphic code for ordering goods by wire and a price-list. The company state that since their catalogue was placed in the hands of the printers they have concluded to add a high nickel plated shelf to their regular high gasoline stoves.

Southard, Robertson & Co., Water street and Peck slip, New York City, are distributing circulars of their Columbus and Waldorf ranges. The former is a six-hole stove for coal or wood and embodies the modern features. It is sold with ornamental cabinet base, or with plain bottom, having a wide hearth and high legs, to which a fancy leg skirting can be bolted. The oven in the various sizes measures 15 x 15 x 10¼ inches. The Waldorf is made heavy and durable, has a large ventilated oven, patent extension flue strip for regulating the heat and draft in the bottom of the oven, extra heavy covers, patent oscillating grate, large ash pan and patent oven door opener. It is made in portable form or for brick work and with right or left hand fire box. The oven measures 20 x 20 x 12½ inches and the top surface of the stove 28 x 38 inches.

Charles B. Hotchkiss, for a long time manager of the New York department of the Barstow Stove Company, will during the ensuing year look after the interests in the city of New York and adjacent territory of the Danville Stove & Mfg. Company of Danville, Pa.

The Magee Furnace Company of Boston, Mass., are the assignees of a patent granted December 12 to Frank A. Magee of Chelsea, Mass., for an improved type or form of water front for use in connection with stoves or ranges. The location of the water front is changed to some extent from that usually employed, so that a relatively small section of its fire pot wall can be touched by the fire in process of combustion. In connection with the water front or back are one or more extensions into the fire pot upon a line with the surface of an ordinary fire, these projections being hollow and connected with the cavity of the water front, and are claimed to materially increase its heating capacity. The extensions may be cast with the front or made independdently and united by screw connection.

The Matthews Mfg. Company of Worcester, Mass., have issued, under date of January 8, an announcement to the stove trade calling attention to the fact that the stove knobs which they manufacture are made under patent No. 475,880, granted May 31, 1893, to Ambrose T. Matthews. This is said to be the latest invention of Mr. Matthews, and differing materially from anything heretofore invented in the line of stove knob bases, covering a very important point, that of economy in cutting stock, thereby reducing the cost of production. The company also state that they own the right to manufacture under the Bennett patent issued March 20, 1883, and the Matthews patent dated December 21, 1886, which enables them to produce the best stove knob in the market at the lowest possible cost without infringing on any other make. The announcement is also made that satisfactory settlement was made for all infringing knobs sold by the company last year, which carries with it the right to use the same. Catalogues of the company's stove knobs and hinge pins are being mailed to the trade by the company's agent, Henry Gleason of New York.

E. D. Purves, representing Southard, Robertson & Co. of New York, will call on the trade in New Jersey, Pennsylvania and the South in the interest of the house.

The Howard Stove Company, Beaver Falls, Pa., have made a voluntary reduction in the rent of houses occupied by their workmen. Rents are reduced $3 per month.

The Wrought Iron Range Company of St. Louis, Mo., are sending out a little pamphlet of pocket size relating to their exhibit at the World's Columbian Exposition, on which they were awarded six gold medals. The front cover of the pamphlet is a *fac-simile* of the official ribbon issued by authority of the World's Columbian Exposition and indicates for what the premiums were awarded. The list covers family ranges, hotel ranges, charcoal broiler, steam table and carving table, malleable iron water back with safety valve, and general display of hotel and family ranges. The pamphlet illustrates and describes these goods and presents a bird's-eye view of the company's factory at St. Louis, and also their branch works at Toronto, Canada.

Robert White, who died at Utica, N. Y., recently, aged 55 years, was an old employee of Rathbone, Sard & Co., Albany, N. Y. The remains were accompanied to the latter city by a delegation of Utica molders and the Molders' Union of Albany attended the funeral.

The Buckwalter Stove Company of Royersford, Pa., resumed operations on Tuesday, January 9, after a brief shut down.

The Kernan Furnace Company of Utica, N. Y., have filed with the Secretary of State at Albany a certificate of the increase of their capital stock from $20,000 to $50,000.

Rathbone, Sard & Co., Wabash avenue and Randolph street, Chicago,

will shortly issue their vapor stove catalogue for this season. Their line of such stoves will this year be more extensive than ever. They not only propose to continue in the vapor stove business but expect to secure a larger share of the trade than in past years. Improvements have been introduced in their line which they believe will be appreciated by their customers.

THE MICHIGAN BRYCE FURNACE COMPANY have been organized at Grand Rapids, Mich., to manufacture and sell the Bryce self-feeding warm air furnace in that State. A. H. Blanchard is president; S. T. Bryce is vice-president, and A. M. Kuhn is secretary and treasurer.

GEO. N. PICKSTOCK, who for the past 11 years has represented J. S. & M. Peckham in Western New York, has connected himself with the Syracuse Stove Works, Syracuse, N. Y., to represent them in the territory above mentioned. Mr. Pickstock has won for himself many friends in the trade, and the Syracuse Stove Works congratulate themselves on acquiring so popular a representative to show their line of Welcome stoves and ranges.

THE J. F. PEASE FURNACE CO. of Syracuse, N. Y., have discontinued their agency at 82 Lake street, Chicago. Arrangements have not yet been made for a new agency, but it is understood that the company have no intention of withdrawing from the Chicago field.

THE following salesmen will represent the Syracuse Stove Works, Syracuse, N. Y., for the year 1894: R. Daggett, C. H. Ingham, C. B. Hill, E. A. Wilbur and G. N. Pickstock.

A tremendous explosion occurred on the night of January 9 at the works of the Portland Electrical Zinc Company, Fish Point, Portland, Maine. The general manager, Parker Choate, was badly burned and otherwise injured. The damage to the works is estimated at $5000.

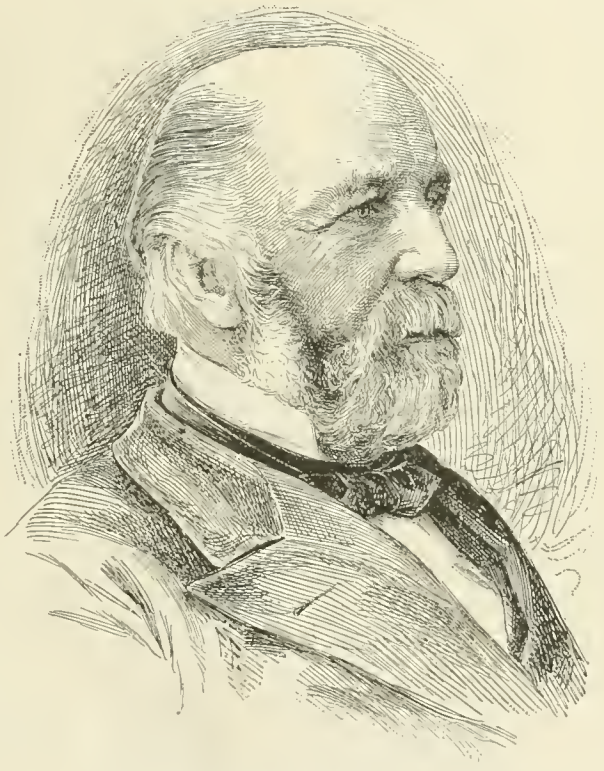
Darius Davison, the naval architect, is, it is said, working on the plans of a ship that is, he says, to be the coming Atlantic liner. The vessel is to be 1000 feet long, 80 feet wide, 70 feet in depth, and to have a displacement of 45,000 tons. She will be moved by four propellers driven by a 50,000 horse-power engine, and the distinctive feature of the ship is a projecting bow and stern, each 150 feet long, an entirely new departure in marine architecture.

The Alps are to be pierced by another railway tunnel. This time it is the Simplon that is to be attacked, by a company recently formed in Switzerland for the purpose. The work is estimated to cost $15,000,000 and to occupy five and a half years.

Sidney Shepard.

As announced in a recent issue, Sidney Shepard, whose portrait we present herewith, died at his residence at New Haven, Oswego County, N. Y., on the morning of December 26. Mr. Shepard was among the oldest and most prominent citizens of Buffalo, he having moved to that city in the spring of 1836, when he was 22 years of age. The business which he started then has since developed into the present houses of Sidney Shepard & Co. of Buffalo, and C. Sidney Shepard & Co. of Chicago.

Mr. Shepard was born at Cobleskill, Schoharie County, N. Y., September 28, 1814. He was descended from Ralph Shepard, who came to this country from England in 1635, while on the maternal side his ancestor was William Hamilton, who came from Glas-



SIDNEY SHEPARD.

gow in 1668. Mr. Shepard's father, who was a physician, was well known throughout Schoharie County, and his grandfather, Hosea Hamilton, was a surgeon in the Revolutionary War and a personal friend of General Washington. At the age of 14 years he left school and took a position as a clerk in a hardware store at Dansville, N. Y. He subsequently removed to Rochester, where he remained until the spring of 1831, when he associated himself in business with a brother in Bath. This enterprise proving successful enabled him to remove to Buffalo in 1836 and purchase a hardware store and found the business which still bears his name. He subsequently established the sheet metal ware manufactory on Clinton and Union streets, and in 1849 became the owner of the Shepard Iron Works, on Ohio street, Buffalo.

Mr. Shepard resided in Buffalo and continued in the active management of his affairs until 1865, when he handed over the control of his Buffalo interests to his partners, and after spending several years in foreign travel returned to this country and purchased the old family homestead of his wife, at the village of New Haven, where he afterward resided.

All of the business enterprises of Mr. Shepard were successful in an eminent degree, and the concerns with which his name is associated attained a very high commercial standing. Mr. Shepard, however, was not content with these achievements and sought a wider field for the exercise of his business ability. He was among the earliest to put faith in the possibilities of the electric telegraph and invested largely of his wealth in the stock of the Western Union Telegraph Company. He was a director of that company until within a few months of his death, when failing health compelled his resignation. He was also prominent in railroad affairs, and was a director in the Mobile & Ohio and Jersey Central roads, in which he held large interests.

Mr. Shepard had been a member of the First Presbyterian Church of Buffalo for over 50 years. He was married in 1851 and his widow and two sons, Charles Sidney and Ralph Hamilton, survive him. Mr. Shepard gave away much during his life, though few, even of his most immediate associates, were acquainted with the extent of his benefactions, for they were bestowed in such a way that they were often known to none but the recipients, and at times even they were not made aware of the source of the gifts. He was not an indiscriminate giver, but exercised the same care and judgment in his charity which he applied in his business affairs. Regarding the personal character of Mr. Shepard, in business and in private life, we will quote the words of one who knew him: "Though Mr. Shepard withdrew some years since from active interest in the Hardware and Metal trades, yet the impress which he made upon all who were associated or acquainted with him during the many years that he was prominently identified with these lines, is a very lasting one. He possessed an exceptional genius for organization and great executive ability. He was a close student of events and had the elements of progressiveness and conservatism happily united in his character. His adherence to the strictest principles of integrity was rigid and unswerving. His disposition was genial and inspiring and his memory will be treasured by all who enjoyed the privilege of knowing him."

A motion has been brought forward in the English House of Commons asking that a committee be appointed to inquire into the management and expenditure of the British section of the Columbian Exposition. Assertions are made that the signatures on certain documents were forged.

THE matter of heating the Court House, at Delano, Minn., is being considered by the local authorities.

TRADE REPORT.

The Iron Market.

Pig Iron.—The sensation of the week in the New York market has been the announcement of a reduction of prices on the part of the Lowmoor Iron Company of Virginia, whose Iron ranks among the highest in quality in this and in the New England markets. The prices announced are $12.50 for No. 2 and $13 for No. 1 Foundry. The Lowmoor Iron Company have taken this step in defense of their trade, but it is not proposed to contract ahead heavily at the low figures made. As yet the other leading makers of the equivalent highest grades of Northern Iron have not followed suit, nor are the facts stated yet so generally known that the producers of the cheaper grades have had a chance to take action. It is probable, however, that the course pursued will bring matters to a crisis, at least so far as this and tributary markets are concerned. We quote: Standard brands, $13 @ $14 for No. 1; $12.50 @ $13 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $13.50 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12 for No. 3; $11.50 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

Our advices from Philadelphia indicate that, in the Pig Iron market sellers are firmer on good brands of No. 1 Foundry, which is relatively in small compass. Additional furnaces are blowing in, however, and as the owners intimate their willingness to meet the market, the chances for any material improvement in prices are thought to be not very strong. Lower grades are in full supply, with prices somewhat irregular and in spots a little weak. Buyers could be found for good sized lots nevertheless, providing that $11 @ $11.25 would be accepted for good all Ore Irons, Philadelphia delivery, or at less than $11 for an ordinary grade. As a rule, bids are about 50¢ below sellers' ideas, so that there is not much actual business to report, and while they may yet come together on a compromise, the question for the present is still undecided. General quotations for seaboard deliveries are about as follows:

No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

In the Chicago market inquiries for Coke Iron have been much more numerous since last report, covering large and small quantities, and coming from all classes of consumers. Sales of small lots have also increased in number. There is, however, no immediate prospect of an improvement in prices, as competition is keen on all orders coming up. Lake Superior Charcoal is extremely quiet, and transactions are confined to small lots only. Bankrupt stocks are being offered low and thus cause reports which are current of a decided break in makers' prices, but they insist that they have not found it necessary to yield, and report sales at about the prices given in our quotations. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.30 @ $15.50
Local Coke Foundry, No. 1	13.00 @ 13.50
Local Coke Foundry, No. 2	12.50 @ 12.75
Local Coke Foundry, No. 3	12.00 @ 12.50
Local Scotch	13.50 @ 14.00
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 13.75
Southern Silvery, No. 2	@ 13.25
Southern Coke, No. 2	11.90 @ 12.15
Southern Coke, No. 3	11.40 @ 11.65
Southern, No. 1, Soft	11.90 @ 12.15
Southern, No. 2, Soft	11.40 @ 11.65
Tennessee Charcoal, No. 1	16.00 @ 16.50
Tennessee Charcoal, No. 2	@ 15.00
Alabama Car Wheel	18.00 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

The past week in Southern markets shows little change over the preceding one, there being scarcely more than a car lot trade in Pig Iron for current delivery, and some of the furnaces are becoming anxious for customers, but they are too careful to urge stocks when there is no disposition to buy. The gloomy reports which come from Pittsburgh and other districts have a detrimental effect upon our market, and there seems to be a tacit understanding between buyers and sellers that prices shall be nominally unchanged for the present. Quotations are as follows:

Southern Coke, No. 1	$11.75 @ $12.00
Southern Coke, No. 2	10.75 @ 11.00
Southern Coke, No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—The best statistical showing made up to the present time has failed to stimulate business in the slightest degree. With business dull and tariff uncertainties perplexing, prices have followed in the wake of the fluctuations in the London market, despite steady, although slow, depletion of stocks in first hands on this side of the Atlantic. As against 20.50¢ @ 20.60¢ quoted a week ago, cash prices for 10-ton or larger lots are 20.20¢ @ 20.25¢ at the present time. The foreign depreciation keeps the American price below the import cost, on the basis of lowest London quotations, and little Tin has been landed except in bond. The available supply at current quotations is comparatively moderate in consequence, but apparently more than sufficient to satisfy imperative trade requirements, the jobbing demand being extremely light, and stocks in dealers' hands of fair proportions. Prices for small lots rule generally at 21½¢ @ 22¢ ℔ lb for Straits Pig, with ¼¢ @ 1¢ advance on Bars.

Copper.—Business in Copper is virtually at a standstill. No improvement has taken place in the demand for any variety of this metal, and dealings have been confined almost wholly to small lots for prompt or immediate future delivery. Were it not for the remarkably large quantity of Copper exported last year the market would doubtless show poorer form. As it is, there are evidences of rather soft undertone and reasons to suspect that current production is running considerably ahead of deliveries. Still the accumulation is causing no unusual pressure to sell and values hold remarkably steady in the face of the dull condition of trade. Lake Superior Ingot is offered by several sellers at 10¼¢, and in remote instances quotations of as low as 10.15¢ @ 10.20¢ have been made. Jobbing prices for small lots of Ingot and Sheet Copper show no change.

The Bureau of Statistics returns give exports of Copper during the 11 months ending November 30 as follows:

	1893.	1892.
Ore.	Tons.	Tons.
To United Kingdom	39,344	44,796
To Germany	1,043	1,462
To other Europe	....	168
Totals	40,407	46,426
Ingots, Bars and Old.	Lbs.	Lbs.
To United Kingdom	33,6 6,042	2,874,969
To Germany	15,796,167	5,699,940
To France	25,259,573	6,756,681
To other Europe	44,186,789	10,913,996
To other countries	723,748	99,206
Totals	119,602,319	26,344,792

Pig Lead.—Through a reduction in the price to 3.20¢ sales of about 500 tons were made at 3.20¢ during the early part of the week. Additional lots were subsequently offered at the same rate, but buyers responded very feebly, and later requests for bids of 3.15¢ were disappointing as an inducement to purchase. The market has thus shown weaker form than at any time since prices broke below the 3.50¢ mark. Consumers are very indifferent, and jobbers only take such an amount of Lead as will keep their stocks in satisfactory shape. The latter look for no revival of interest in this metal until some better prospects open out in the building trades. Prices for jobbing quantities of American Pig are quoted at 3¾¢ @ 4¢ ℔ lb. There is no change in quotations for Lead Pipe or Sheet Lead.

Spelter.—Lower prices are again to be recorded. Ordinary Western brands

have been sold at 3.50¢ @ 3.55¢, and the better sorts have commanded merely the ordinary premium. It does not appear that the concessions made have expedited business in the slightest degree. To the contrary, the market, besides showing weakness, is surprisingly dull, with nothing in the way of surroundings indicative of any decided change for the better in the immediate future, since European as well as home markets have shown a downward tendency. Jobbers' price for Western Spelter in small lots is 4¼¢ ₱ lb, with the usual premium on fancy brands.

Tin Plate.—The revival of demand for Tin Plates which in ordinary times develops after the first week in January has as yet failed to materialize, although spot sales of small quantities have been rather more numerous and a little more inquiry is noted by jobbing houses. Consumers take only such goods as absolute wants dictate and manifest little interest in forward deliveries, although the latter have, in some instances, been offered at specially low prices for February and March shipment. Prices all along the line are somewhat soft, and for good sized orders buyers can, as a rule, command a material shading of quoted rates. The trade is, in a word, in a condition of restless uncertainty, awaiting the fate of the new tariff bill. The general aspiration is that whatever changes are made in the Tin Plate duty may be made quickly, as otherwise business will continue at the present low level, if it does not go from bad to worse.

A London cable dispatch to *The Iron Age*, dated January 10, reports that the British Tin Plate market continues quiet. Inquiries are few and orders are limited. Many American offers have been refused owing to lowness of limits at which buyers seem disposed to enter large contracts. Liverpool quotations are given as follows:

IC Charcoal, Alloway grade	12/3 @ 12/9
IC Bessemer Steel, Coke finish	11/3 @ 11/6
IC Siemens " " "	11/6 @ 11/9
IC Coke, B. V. grade, 14 x 20	11/3 @ 11/6
Charcoal Terne, Dean grade	10 9 @ 11/

A later cable message to Bruce & Cook reports that the quarterly meeting at Birmingham on Thursday, January 11, was poorly attended. Buyers' views were much below those of sellers as to prices, consequently little business was done.

THE AUTOMATIC FAUCET COMPANY have been incorporated to manufacture Automatic Faucets in Brooklyn, N. Y. The directors are Max Ruben, Louis Sanders and Jas. L. Jensen, of that city. Capital, $5000.

WATERBURY BRASS COMPANY, Waterbury, Conn., and 296 Broadway, New York, announce, under date of January 1, that they have just completed extensive brass rolling and wire mills to replace those destroyed by fire in January, 1892. They have placed in these mills new and improved machinery, which will enable them to meet the requirements of the trade on manufactured goods.

Chicago Report.

Scrap.—The supply of Old Iron and Steel is much more abundant and prices are very weak, with dealers not inclined to buy anything but bargains. Dealers furnish the following list of nominal buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	7.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3⅛¢
Pipe Lead	....	2⅛¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—Trade continues extremely dull and prices are cut in the effort to move stocks. Carload lots of 12 net tons or over are still nominally quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

THE SCOTTDALE IRON & STEEL COMPANY, LIMITED, of Scottdale, Pa., manufacturers of Iron and Steel Sheets, are adding two new Sheet mills to their equipment and buildings to cover same. The addition of these two new mills requires the erection of two additional Sheet heating, two Bar heating and one annealing furnace, which are now under construction. This firm are also putting in one of Warren Webster & Co.'s feed water heaters and purifiers of 1500 horse-power. The excavating has been completed and the materials are now on the ground for the foundations. New foundations are also being put in under the large Sheet mill engine and fly pit wheels, and a new wrought iron shaft is being added to one of the fly wheels to replace an old one. Other necessary repairs are also being made.

A COMPANY has been organized at Portland, Maine, to manufacture metal goods, with $35,000 capital stock. O. D. Thomas is president and G. W. Jeffrey treasurer.

CONDITION OF THE

Hardware Trade.

IT IS as yet too early in the year to expect a marked improvement in the volume or the tone of business, but it is pleasant to note the active preparations which are being made for the trade of the coming months, and the disposition to take a cheerful view of things. Reports indicate that mills and factories are starting up, showing not only that the manufacturers are preparing for business, but are giving employment to operatives and thus setting in motion the wheels of trade in many diversified fields. Travelers are also being sent out, as jobbers and manufacturers are desirous of securing orders, thus contributing their part toward the resumption of normal activity. It is, of course, too early as yet for them to be sending in many orders, but we are advised that they are beginning to be heard from and in a fairly satisfactory manner. Notwithstanding the complaints which were made of trade in the past year, and especially of the last half, it is pleasant to note that the volume of business in many cases is reported as comparing favorably with ordinary years, and a great majority of concerns are doubtless in a position to push energetically for success in the year on which we have entered. It is also an excellent sign that there is a disposition to take a cheerful view of the situation, and while not entertaining unreasonable expectations in regard to the volume of business for the next month or two, the trade are disposed to avail themselves of the opportunities presented and to move with enterprise in the prosecution of their interests. This is certainly not the time for reckless expansion or speculative buying or for the abandonment in any way of the careful, conservative policy which has characterized the trade for some months, but it is desirable that the trade at large should contribute their part and do what they can in the direction of promoting the general prosperity. To this end it will be well for the jobbing trade in their larger purchases and for the retail trade, whose orders, though separately small, aggregate an enormous volume, to avoid the mistake of undue caution, and begin to buy more freely. It would seem that the time has come for the merchants who are in a financial condition to do so to replenish assortments which have become too much depleted and broken, and for each to cultivate his own field, whether it be large or small, so that goods may soon be moving with old time freedom.

Advices from Chicago.—Some of the jobbing houses now have their salesmen out on the road and are feeling rather encouraged by the orders thus early received for seasonable goods for spring delivery, such as Screen Doors, Wire Cloth and other

articles in the same category. The retailers are reported to be carrying very light stocks of all classes of goods, but are buying only to the extent of their immediate wants. Wire Cloth seems to be in considerably better condition than last year at this time. The price was then $1.35, but is now $1.50 on small lots or $1.45 for 25 rolls and upward. Manufacturers of Wire Cloth have adopted a new policy, and now only allow the Chicago rate of freight. Last year they delivered to the Missouri River. This change places Chicago jobbers in a better position for the Western trade. Collections are good and money seems to be more plentiful among retailers. Heavy Hardware jobbers report better inquiries from their customers, but the volume of business is still light. They consider prospects encouraging for a better trade in a short time.

Notes on Prices.

Wire Nails.—There are evidences of a slight quickening in the demand for Wire Nails, and a fair number of orders are being received by the manufacturers from both the larger and the smaller trade. A new year having been entered upon, and the business of 1893 closed, there is a disposition to prepare for future business, and the trade are accordingly replenishing their stocks. The mills are pursuing a conservative policy and avoiding undue accumulation of Nails, some of them being stopped for the present and others diminishing their output considerably. Prices remain as at the last report, the market being represented by the quotation of $1.10 for carload lots at mill, a figure from which a concession of 5 cents is sometimes made on attractive orders. Small lots from store are held at $1.35 to $1.40.

Advices from Chicago.—It would appear that $1.15 Chicago is now the bottom price on factory lots of Wire Nails. The manufacturers who have been disturbing the market by low offers for spot cash made no impression, and as quite a number of factories are shut down, the others are able to maintain their prices. The active companies are well supplied with orders and are in receipt of steady inquiries, which promises considerably better business in the near future. They are quoting $1.20 Chicago on ordinary lots. Jobbers report a growing demand for carload lots of Wire Nails from their customers. They are discouraging this business, however, as they do not think it good policy to overstock the retail trade. They quote, in a regular way, $1.30 to $1.35 for small lots from stock.

Cut Nails.—The Cut Nail manufacturers are in general adhering to the low prices with which December closed, the quotation of 90¢ in carload lots at mill being a representative one, from which concessions are made in some cases. The demand is only moderate, but some orders are being received. Small lots from store, in New York, are held at $1.20 to $1.25.

Advices from Chicago.—An improved demand is noted for Cut Steel Nails and manufacturers are pleased at the receipt of orders from sections which have for some time been handling Wire Nails exclusively. They expect to sell more Cut Nails this year than last. Prices on factory lots are maintained at $1.15 to $1.20, Chicago. Small lots from stock are quoted at $1.25.

Barb Wire.—The Barb Wire market is in substantially the same condition as at our last report. The demand is moderate and prices are somewhat uneven. Galvanized Four Point may be quoted reguarly at $2.05 at mill, with 5 cents off in carload lots. Painted at mill is held at $1.65, with 5 cents off in carloads.

Advices from Chicago.—The Barb Wire trade is rather quiet in this immediate section, but heavy business is reported to be under way in the Southwest and especially in the Indian Territory. Prices of carload lots of Galvanized are $2.25 to $2.30, Chicago, while jobbers ask $2.40 for small lots from stock.

Curry Combs.—The American Curry Comb Company, Troy, N. Y., and 33 Chambers street, New York, have issued a supplement to be attached to their catalogue of January 1, 1893. It represents a number of recent additions to their line of Curry Combs, illustrations of which are given. The company have also been issuing revised quotations on their entire line.

Very nearly all the leading manufacturers are acting in concert in the matter of prices, and as a result most of the low quotations which were outstanding have been withdrawn, and the market is thus somewhat higher and characterized by a decidedly firm tone.

Pattern Dowels.—Standard Pattern Dowels, manufactured by W. S Hawker, Broad and Adria streets, Philadelphia, Pa., are sold at a discount of 25 per cent. from the following list:

Inch.	Per doz.
1/4 Dowels	$0.35
3/8 "	.55
1/2 "	.75
5/8 "	.90

Curling Irons.—The Columbian Folding Curling Irons, recently introduced and manufactured by the American Curling Iron Works, 72-74 Market street, Chicago, are sold at $18 per gross net.

Milk Can.—The S. & P. Milk Can, manufactured by the Stuart & Peterson Company, Burlington, N. J., recently placed on the market, is sold to the retail trade at $6 net each, from which price a discount is made to jobbers.

Sheet Zinc.—Revised quotations on Sheet Zinc have been issued by the Matthiessen & Hegeler Zinc Company, La Salle, Ill., under date January 1. The price of $4.50 per 100 pounds is announced for Sheet Zinc in 600-pound casks of the thicknesses between Nos. 9 and 15, inclusive, of the widths between 32 and 46 inches, and of the lengths between 84 and 90 inches. The following are the extras in cents per 100 pounds:

Nos.	5	6	7	8	9	10	11	12	13	14	15
32 to 40 x 84	55	35	20	05	.....	.....	.....	.....	.....	.....	.....
32 to 46 x 84 to 90	....	....	....	....	none	none	none	none	none	none	none
52 x 84	....	....	170	70	60	50	35	35	35	35	40
50 x 84	..	....	110	55	40	25	15	15	15	20	20
48 x 108	...	....	90	65	55	35	15	15	15	20	20
48 x 96	....	....	75	35	30	15	15	15	15	15	15
48 x 84	190	100	60	20	15	05	05	05	05	05	05
36 x 108	120	105	55	30	25	15	15	15	15	15	15
36 x 96	100	50	30	20	15	05	05	05	05	10	10
30 x 84	80	50	40	20	10	10	10	10	10	10	10
28 x 84	90	60	45	25	20	20	20	20	20	20	20
26 x 84	105	70	55	30	25	20	20	20	20	20	20
24 x 84	115	80	65	15	10	05	05	05	05	05	05

Bright Wire Goods.—The market for Bright Wire Goods continues an open one, with a decidedly active competition between the different manufacturers. As a result, prices have been crowded down until they have reached a figure which is referred to as lower than the goods have previously touched.

Tacks.—The Tack market is in a better condition than for a long time. In casks of 100 pounds of the usual numbers 30 cents extra per 100 pounds is charged and other charges for small lots are as before. The following revised discounts are announced:

Discounts.	First Class. 15 600-pound casks, and upwards	Second Class. 10 to 14 600-pound casks.	Third Class. 5 to 9 600-pound casks.	Fourth Class. Under 5 600-pound casks.
Special	8 per cent.	8 per cent.	8 per cent.	8 per cent.
Cash with order	3 "	3 "	3 "	3 "
Quantity	3 "	2 "	1 "	0 "
	14 "	13 "	12 "	11 "

All discounts are computed straight when money accompanies the order. The quantity discount is added to the special discount in all cases. If remittance is received within ten days of

date of invoice the cash discount will be only 2 per cent. instead of 3 per cent. and not computed straight. Each order is strictly subject to the quotation of the class to which it belongs.

Shrinkage Rule.—The Improved Shrinkage Rule, manufactured by the Thompson Hardware Company, Lowell, Mass., is sold at $2.50, net, each.

Glass.—There is no change in the condition of the Glass market, trade being of a from haud to mouth character. Factories are making only enough Glass to supply demanda and are not stocking up to meet orders during the annual summer shut down, as is usual at this aeason of the year. Local business with jobbers is quiet, a condition of trade not unexpected at this season of the year. Architects are reported as being engaged on a large amount of prospective building, which, if carried through to completion, will create a large demand for Glass. Plate Glasa factories are starting up, with reduction of wages in most cases, some having orders in hand sufficient to keep them employed for some time. Quotations by jocal jobbers are from 80 and 10 and 5 to 80 and 20 per cent. discount for single strength in 100-box lots, and 85 per cent. discount direct from factory. French Window Glass is quoted at 75 and 10 and 5 to 80 and 5 per cent. discount. Quotationa from Western Window Glass and Plate Glass factories remain unchanged, as quoted in our last issue.

Old Metals.—The local market for Old Metals continues dull, with prices on the same low level at which they have now remained for many weeks. Even these low prices are no inducement to any one not in absolute need of material, and dealers are consequently more or less hampered with stocks, which they are not inclined to supplement. The following quotations represent about the prices paid in New York for moderate quantities:

Heavy Copper	℔ lb		7¢
Light and Tinned Copper	℔ lb		6½¢
Heavy Brass	℔ lb		5¢
Light Brass	℔ lb		4½¢
Lead	℔ lb		3¢
Tea Lead	℔ lb		2¾¢
Zinc	℔ lb		2½¢
No. 1 Pewter	℔ lb		14¢
No. 2 Pewter	℔ lb		6¢
Wrought Scrap Iron...℔ gross ton		$7.00 @	$8.00
Heavy Cast Scrap...℔ gross ton		8.00 @	9.00
Stove Plate Scrap...℔ gross ton		4.00 @	5.00
Burnt Iron, ℔ gross ton...		2.50 @	3.00

Old Rags, Paper, &c.—No marked improvement in the demand for this material is noted. The market remains quiet and prices more or less nominal, the following being approximately those at present ruling in New York:

No. 1 White Rags	℔ lb	3¼ @	3½¢
No. 2 White Rags	℔ lb	2¼ @	2½¢
Mixed Rags	℔ lb		¾¢
Blues and 3ds	℔ lb	1 @	1¼¢
Hard Sized White Shavings	℔ lb	2¼ @	2½¢
No.1 White Book Shavings	℔ lb	2 @	2⅛¢

No. 1 Manila Paper	℔ lb	1 @	1⅛¢
No. 2 Manila Paper	℔ lb	⅝ @	¾¢
Bogus Paper	℔ lb		½¢
Common Paper	℔ lb		⅜¢
Straw Chips	℔ lb		⅛¢
Binders' Clippings	℔ lb	½ @	⅝¢
Jute Butts	℔ lb	1⅞ @	2 ¢
No. 1 Jute Bagging	℔ lb	1 @	1¼¢
Mixed Bagging	℔ lb	¾ @	1 ¢
No. 2 Bagging	℔ lb	½ @	¾¢
Hemp Twine	℔ lb	2 @	2¼¢
Manila Rope	℔ lb	2¼ @	2½¢
Jute Rope	℔ lb	1½ @	1¾¢
Mixed Rope	℔ lb	¾ @	⅛¢

Old Rubber.—Market narrow and prices irregular. The following quotations are those nominally ruling for Old Rubber delivered in this city:

Car Springs, ton lots, ℔ lb.	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@	.03
Rubber shoes, less than carloads, ℔ lb.	0.02¼ @	.03⅛
Large Hose, ℔ ton	@	9.00
White Wringer Rolls, ℔ lb.	@	.04¼
White Syringes, ℔ lb.	@	.05

Trade Notes.

McLane & Schanck, Lineaville, Pa., send us a four-page circular of a Maple Evaporator which they manufacture for the trade. It is said to be so constructed as to require little coal, and is cheap and durable. The circular presents a general view of the device, together with instructions for setting. Another feature is a price-list of the Evaporators together with Sap Buckets Syrup Cans, Gathering Tanks, &c.

Among the corporations chartered at Harrisburg, January 5, was the Merchant Company, incorporated in Philadelphia, to manufacture Iron or Steel, with a capital stock of $400,000. The incorporators are Clarke Merchant, Henry W. Merchant, Leslie Chase, Dallas Sanders and J. Estelle Merchant, all of Philadelphia.

The Britton Rolling Mill Company, Cleveland, Ohio, issues a notice to the trade emphasizing the fact that it is not their company that has changed its name. They say that the Britton Rolling Mill Company is still the Britton Rolling Mill Company, and that it manufactures Iron and Steel Plate, sheared and universal rolled; also Soft Steel Sheets as light as No. 20 gauge.

The Fred. J. Meyers Mfg. Company expect to have their new plant, at Hamilton, Ohio, in full operation by the end of this month. They have two very large and complete buildings with ample grounds and excellent railway connections. The buildings are completely furnished with machinery for the manufacture of their well known line of goods.

The Wainwright Mfg. Company of Boston have transferred to the Taunton Locomotive Mfg. Company, Taunton, Mass., the right to sell and manufacture the goods which they have supplied for several years past. For four years the Taunton Company have manufactured all of their Heaters, Condensers, Expansion Joints and Corrugated Gaskets under a manufacturing contract. They are thus thoroughly acquainted with the various requirements of customers and with the technical and engineering features of the business. The present agents will continue the sale of the goods on behalf of the Taunton Company.

During 1893 the Eagle Iron & Steel Company, Ironton, Ohio, manufacturers of Bar and Sheet Iron and Steel, turned out 11,520 tons of Bars and 1869 tons of Sheets. This is a little less than the average production of this concern for the year 1892.

W. J. Gordon is calling the attention of the trade to his Automatic Body Seamers, Combination Presses and Dies and Can Makers' Tools. A leading feature in the Seamers he is making is the practicability of seaming the bodies of cans in one operation. One of these Seamers has just been shipped to Bayer & Co. of Baltimore.

The Thatcher Furnace Company, 33 Peck slip, New York, publish in this issue a page advertisement, in which they direct the attention of the trade to their specialties, including the Scorcher and Thatcher Hot Air Furnaces.

From the Cincinnati *Inquirer* of January 7 we learn that the name of F. H. Lawson has been canvassed as a Republican candidate for Mayor. Mr. Lawson is a member of the firm of F. H. Lawson & Co., the well-known Tin Plate dealers, and is spoken of in very high terms.

THE METAL WORKER.

NEW YORK AND CHICAGO.

Saturday, January 20, 1894.

DAVID WILLIAMS, - PUBLISHER

BUSINESS OFFICES:

NEW YORK.....96-102 Reade Street.
PHILADELPHIA.....220 South Fourth Street.
BOSTON .....146 Franklin Street.
PITTSBURGH..... Room 509 Hamilton Building.
CHICAGO..... 59 Dearborn Street, cor. Randolph.
CINCINNATI.....Rooms 22-24 Pickering Building
ST. LOUIS.....Bank of Commerce Building.
CLEVELAND.....312 The Cuyahoga.

BRITISH AGENCY: The Ironmonger, 42 Cannon street, London, England.

The Index of *The Metal Worker*, Volume XL, July-December, 1893, is now ready and may be obtained on application to David Williams, publisher, 96-102 Reade street, New York; or to 220 South Fourth street, Philadelphia; Room 509 Hamilton Building, Pittsburgh; 59 Dearborn street, Chicago; Rooms 22-24 Pickering Building, Cincinnati; Bank of Commerce Building, St. Louis; 146 Franklin street, Boston, and 312 The Cuyahoga, Cleveland.

Instruction in Sheet Metal Pattern Cutting.

Reference was made in *The Metal Worker* of October 28 and November 18, 1893, to the possibility of a class for instruction in sheet metal pattern cutting being added to the trade school of the Pratt Institute, Brooklyn, provided a sufficient number of candidates for membership were forthcoming. It is now gratifying to be able to announce that Professor Richards, of the Pratt Institute, has decided to inaugurate a class for sheet metal work next fall. It was at first proposed to commence the class with the new year, but it was believed that a better start could be made by postponing it to the beginning of the regular Pratt Institute season of 1894-95, as a better attendance could probably be secured at the later date, and the course of instruction could be carried out uninterruptedly through a six months' session. Professor Richards has intimated that he expects to be thoroughly prepared to make an effective start next fall; but he particularly desires that applications from candidates for instruction should be forwarded to him as soon as possible, in order that he may be able to calculate the size of the class for which it will be necessary to arrange. We trust that such of our readers as are interested in this matter, and who desire to obtain the advantages held out, either for themselves or others, will not fail to notify Mr. Richards accordingly at the earliest possible date. Applications should be made, either by letter or in person, to Prof. C. R. Richards, director of the Department of Science and Technology, Pratt Institute, Ryerson street, between DeKalb and Willoughby avenues, Brooklyn, N. Y. Judging from the thoroughness with which other trades are taught in the Institute, we are convinced that the new sheet metal pattern class will prove an equally efficient means of education in that particular handicraft.

Machinery and Hours of Labor.

One of the effects of improved machinery has been a reduction of daily hours of labor in many branches of manufacture. Perhaps a more accurate statement would be that the increased employment of such machinery has rendered it possible to shorten hours of labor without unduly restricting the supply of anything wanted by the population of the world, and, seeing this possibility, labor has demanded and in many instances has obtained the reduction. Whether the effect of the change thus wrought will ultimately prove beneficial or hurtful all round, it is yet too early to determine; but it seems certain that to a great number of workmen who expend the time thus gained in saloons it cannot have been much help to an improved mode of living, or have conduced greatly to their growth in skill in their respective trades. Saloons are bad schools at best; and now that night schools, free reading rooms and libraries are made accessible to most workmen, it would seem that if, as a rule, their desire for a higher plane of life was urgent, the multitudes of saloons that flourish now in all our large cities, and subsist on the patronage of labor would not long continue so prosperous, and that when hard times like the present come, there would not be so many glad to accept as a charity the bread they are unable to purchase.

Western Banks.

An event of considerable importance to the Northwest is the resumption of the Marine Bank, commonly known as the Mitchell Bank, at Milwaukee. The failure of this great institution last summer did more to shatter confidence in the stability of the banks of that section than any other event. It had stood the storms of a half century and was deemed impregnable, having behind it what were popularly supposed to be unlimited resources. When it collapsed there is little wonder that depositors in smaller banks clamored for the immediate payment of their accounts. The great majority stood the shock safely, and since then business has slowly improved until now the conditions are favorable for the reorganization of the most conspicuous victim in the Northwest of the financial depression. The repairing of the ravages of the panic thus proceeds, even though slowly, and times are shown to be steadily growing better.

An Improvement In the Business Situation.

There can be no doubt, says *The Iron Age*, that the tide is turning in the business affairs of this country. From every quarter come indications of a slight improvement, although thus far the iron and metal trades have participated but little in it. Reports from some financial circles prove that money is again beginning to flow into investment channels. It is a well-known fact that municipal and kindred bonds are finding quite a ready sale at fair prices. The effect has already been witnessed in the larger demand for pumping machinery, cast iron pipe and supplies for water works extensions.

A somewhat surprising fact brought out by a number of interviews with the presidents of some of the leading savings banks of New York is that money is flowing back into those institutions. In spite of the widespread distress among the working classes the deposits during December and thus far in January have exceeded the withdrawals, and in some of the large institutions from one-half to two-thirds of the loss of deposits during the runs of the summer have been recovered. Of course, this merely means that the more thrifty among savings banks depositors have regained courage, and are tired of losing interest. Although much cannot be expected for a long time to come from foreign investors, who have been shocked again by such happenings as the Atchison receivership, yet it is true that houses with European connections have had some orders lately for bonds, which have been unsalable for many months.

Manufacturers in the staple lines also note increasing inquiry and are doing a better business. No one claims that the normal demand has even been approached, but the shrinkage has stopped and tentative, timid expansion has begun. No one is sanguine as to the rate of progress which we may attain in the next few months. There are too many adverse influences at work to admit of rapid recovery. But after the long period of trial and disaster it is joyful tidings that the business situation is improving, slight though that recovery may be. Iron manufacturers are generally convinced that the actions of certain concerns in the trade have needlessly pounded values to the present extraordinary level of prices. Has it occurred to buyers and sellers alike how sudden the recovery is likely to be when the ruthless raiders withdraw even temporarily from the field?

THE LETTER BOX.

Fails to Bake on the Bottom.

From W. S., *Guelph, Ontario.*—Will some of the readers of *The Metal Worker* answer this question: We are selling three or four lines of coal and wood ranges, and we find in some cases they will not bake on bottom of oven. We can get a good fire and they will bake on top of oven, but the bottom is quite cool. In some cases we have put in other stoves and they work well. If any of your readers can give us a pointer they will greatly oblige us.

Note.—We hope our readers will embrace the opportunity to give their experiences on the trouble in question. The principle involved in baking is that the air that enters the grate in passing through the coals is heated and with the burning gases must pass to the bottom of the oven with sufficient rapidity to raise the bottom of the oven to a high temperature. If their principal heat is imparted to the top of the oven and lost before it gets to the bottom, naturally, baking cannot be done on the bottom of the oven. The fire is located considerably above the bottom of the oven and the heat has to take an unnatural or downward passage to reach it. This can only be effected by a strong draft in the chimney, drawing the hot gases down to the low point quickly. Just why stoves of similar construction should operate successfully where others have failed cannot be determined, except by a careful study of the small details. A change in the size of the pipe, a more careful connection with the chimney, so that no air can enter into it, or some other similar and apparently slight change might bring a successful result. As a rule, where a stove fails to bake on the bottom, those of long experience endeavor to improve the draft in some way.

Removing Oil from Brass.

From H. R. R., *New York.*—Please advise me through the columns of *The Metal Worker* if you know of a liquid that will remove oil and grease from brass and which is not so inflammable as benzine.

Answer.—We presume our correspondent has thought of turpentine, but there is the same objection to it as there is to benzine, because of its inflammability. We think if he will try a more or less strong solution of ammonia in water he will find it to work satisfactorily. Strong ammonia would be uncomfortable to handle and we believe it has some effect upon brass, though we doubt if it would attack it to any noticeable degree. Mixing it with water, however, would remove this possible danger and make it more conveniently handled and at the same time remove the grease. For that matter any strong solution of alkali would be effective if ammonia is not suitable.

Tempering Gun Springs.

From C. L. M., *Harrisonburg, Va.*—Some time ago the question was asked how to temper gun springs. The following description of my method may prove of interest. I first take the spring to be tempered and fit it in the lock, to see that it fits properly. Then heat to an even cherry red and drop it in water. Next take about four pounds of lead, heat it until it will just burn the shavings that you can scrape from a hammer handle with a knife. They must curl up and burn slowly. Put a piece of wire around the spring and hold it in the lead until the lead chills around the inside of the ladle. Take the spring out and let it cool slowly, and you will have a good, even temper. With a little practice the spring can be given any temper required.

Pipes from Tank.

From D. W. A., *New York.*—The illustration in *The Metal Worker* of December 23, of a wind mill tank of "M. T. C.," Riverside, Cal., shows the overflow going down the outside of the tower, which is tapered. Therefore, the pipe would be on the same angle, which would throw the end of the nipple inside of the tank down, so that the top of the nipple inside of the tank would be lower than the bottom of the nipple at the elbow, and therefore make a trap, as shown in Fig. 2. It is not likely that any air is between A and B in Fig. 1, because your correspondent has had water running through the pipe, and it would never empty below the line A B after once being filled. The reason it runs through the overflow after being started from the house main is that the friction in the 360 feet of pipe is so much that the water rises in the overflow and forces part of the air out by bubbling up through the tank at C. Then, when the tap between the house main and overflow is shut, the water in the overflow would fall down to A, drawing enough of the water over at C to act as a syphon and force the rest of the air down through the pipe and out at B. If a small hole, $\frac{1}{8}$ of an inch or larger, is bored at D, it would allow the air to pass out at any time. If desired, a small pipe could be put in this hole, level with the top of the tank, but I do not think it is necessary.

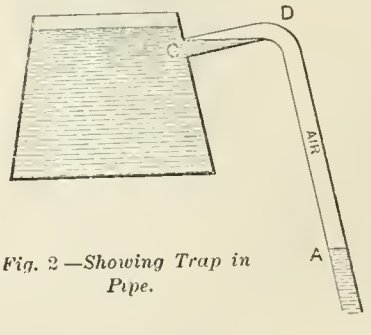

Fig. 2.—Showing Trap in Pipe.

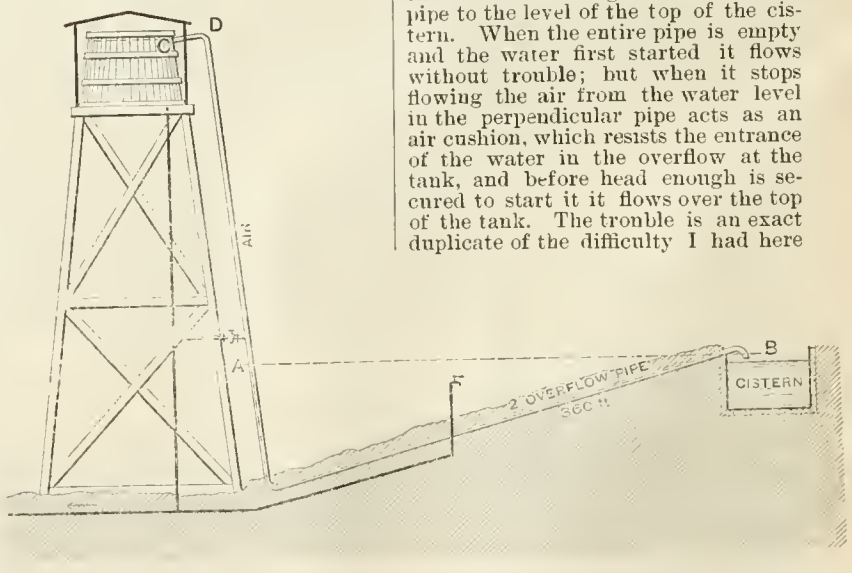


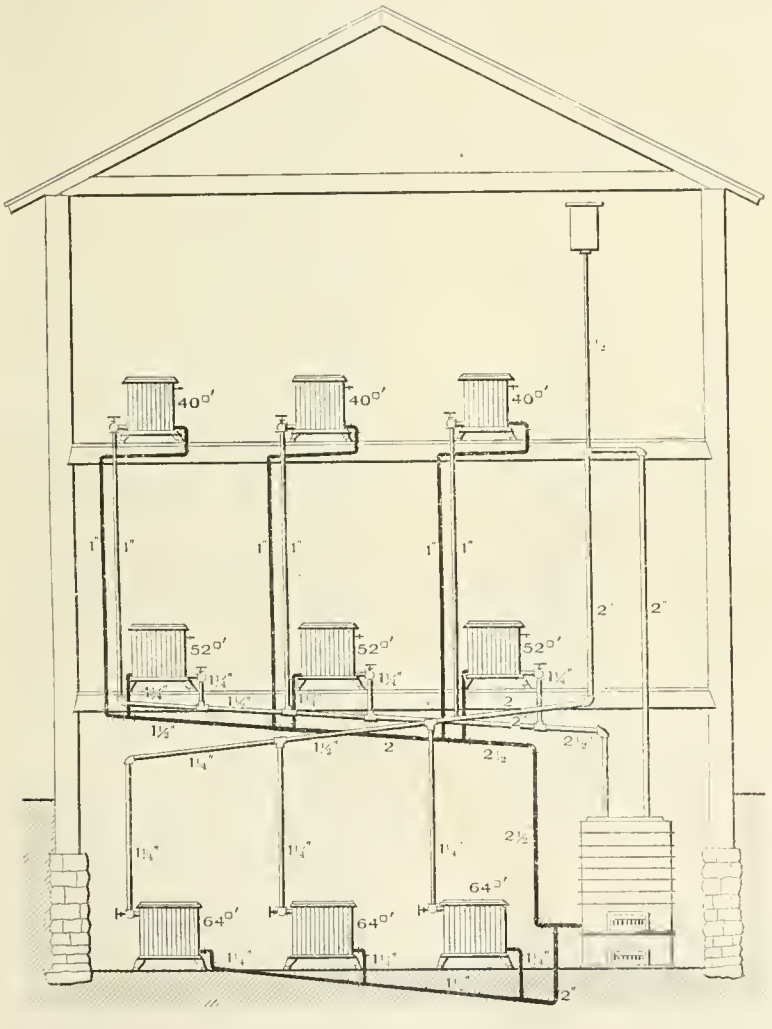
Pipes from Tank.—Fig. 1.—Showing Arrangement of Pipes.

From W. E. W., *San Diego, Cal.*—I think "M. T. C.," Riverside, Cal., whose letter appeared in *The Metal Worker* of December 23, is having trouble because the pipe is air bound, the water standing in the overflow pipe to the level of the top of the cistern. When the entire pipe is empty and the water first started it flows without trouble; but when it stops flowing the air from the water level in the perpendicular pipe acts as an air cushion, which resists the entrance of the water in the overflow at the tank, and before head enough is secured to start it it flows over the top of the tank. The trouble is an exact duplicate of the difficulty I had here with the same kind of an outfit, and which I remedied by disconnecting the overflow pipe from the tank and putting a tank about 30 inches deep on the top of the pipe to cistern and letting the overflow from the tank empty into it and thereby getting head enough to start it. The pipe entered the small tank at the bottom and the arrangement worked perfectly.

Piping a Hot Water Job.

From R. E. M., *Philadelphia, Pa.*—Being somewhat interested in the subject of hot water heating, I wish to ask your readers for their views on piping a piece of work having three radiators on the same level as the boiler, three on the first floor above and three on the second floor above. From the construction of the work it seems to me that it would be very difficult to get proper circulation.

Answer.—This appeal seems to be directed to our readers, and we hope they will embrace the opportunity to discuss the subject of getting circulation through radiators on a level with the boiler. We take the liberty, however, of submitting the following plan for piping such a house as described, presuming that the radiators are one above the other and all on the same side of the heater. As shown by the illustration, probably the simplest way for the first and second floor would be to take a 2½-inch flow pipe from the heater, rising 1 inch in 10 feet, toward the extreme end; taking a 1¼-inch branch from the top of the main to the first radiator on the first floor above the boiler. Then reduce the main to 2 inches and take a 1-inch riser to the first radiator on the floor above. Take another 1¼-inch connection from the top of the main to the second radiator on first floor; continue the main the same size and then take a 1-inch riser to the second radiator on the floor above; then reduce the main to 1½ inches and take a 1¼-inch connection to the third radiator on the first floor; then reduce the main to 1¼ inches, and continue to a point where it turns up, with a reducing ell to a 1-inch riser to the last radiator on the floor above. Place an air valve at the highest point on the return end of all the radiators on the first and second floors. The return mains should be carried alongside of the flow mains, receiving the return connections from the radiators, all being the same size, with a fall toward the heater of 1 inch in 10 feet. The radiators on a level with the heater should have a separate main, using a 2-inch syphon connected from the top of the heater and running up to the ceiling on the first floor, turning with an elbow and a nipple into a T. Take ½ inch air pipe from the top of the T to expansion tank located on the upper story above the highest radiator. Then from the bottom of the T carry the main 2-inch pipe down to the cellar ceiling, running across and falling toward the furthest radiator, with a fall of at least 1 inch in 10 feet. From the side of the main take a 1¼-inch connection to the top of the first radiator, then reduce main to 1¼-inch pipe and take another side connection to the top of the next radiator; then reduce the main to 1¼ inches, running over and dropping down to the top of the last radiator. The returns should connect at the bottom of the radiator on the opposite end. The return connections should be of a size to correspond with the flow connections, and the main should increase in size to correspond with flow main and fall 1 inch or more in 10 feet toward the heater, rising suddenly into the return of the heater. It will not be necessary to place air valves on cellar radiators, but a quick opening valve on the flow connections on all the radiators would be an advantage.



Piping a Hot Water Job.

Fails to Heat First Floor.

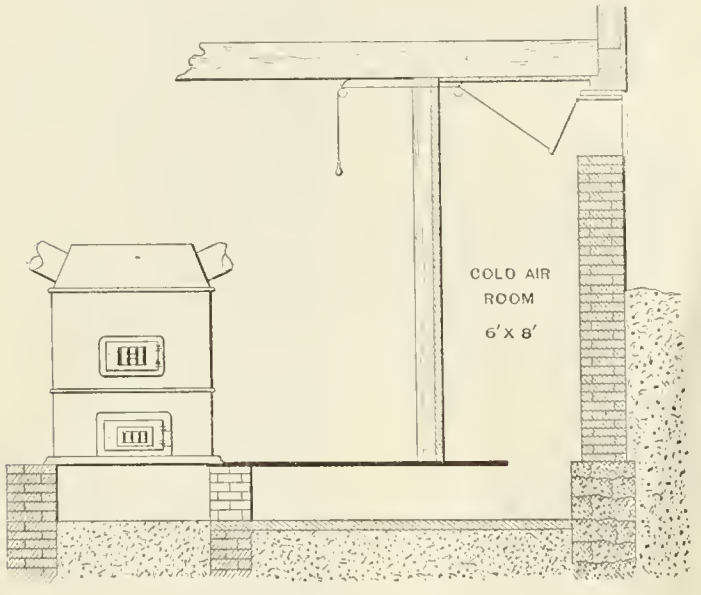
From A. G. D., *Marlton, N. J.*—I apply to The Letter Box for information on the following: One of my customers has a fireplace heater that does not work as well as it ought to. It fails to heat the parlor, which is a room 12 x 20 feet, with an 8 x 10 register opening about 5½ feet from the floor. The hot air flue is brick, 8 x 8, with a cut off in it just 4 inches above parlor register. When the cut off is opened the heat warms two rooms on second floor nicely. It also heats a room 12 x 20 that it is in, but fails to heat the parlor, and I would like some information as to the cause through The Letter Box.

Answer.—As we understand the statement of our correspondent, the fireplace heater is in one room, which is 12 x 20 feet, and the flue that leads from it has an opening in another room on the same floor. The difficulty of heating a room on the same floor has been experienced by all who have set fireplace heaters. Our correspondent's flue capacity is 64 square inches, while his register capacity is only 53, which shows that the register in the parlor is too small, when the cut off is closed, to force all the heat into that room. The register should always be somewhat larger than the capacity of the flue to allow for the friction of the air passing through it. The location of the room to be heated has another influence. If it is on the north or west side of the heater some difficulty will be experienced in getting the air to pass into it. The register being placed so near the ceiling has a tendency to create an up draft from the heater and bring the current into the room; but if there is no sufficient outlet for the air, it is hardly probable that the strength of the current from so short a flue would overcome the resistance of the air that is already in the room to the entrance of more. The parlor could be heated more readily if a register was placed in the floor and a pipe connected with the base of the fireplace heater, so that some air would be drawn from the room to supply the heater and make room for the hot air to enter. We should, however, particularly recommend our correspondent to consult the manufacturers of the heater, who are interested in the success of the apparatus and are in the best position to give advice.

Loss of Heat from Furnace.

From C. J. A., *Denver, Col.*—Replying to the inquiry of "C. E.," New York, in *The Metal Worker* of November 18, who says his customer's furnace heats the cellar, there are several reasons for a furnace heating the cellar, and one or more of the following causes may be the difficulty: 1, improper location of furnace; 2, hot air pipes being too long and too small; 3, poor air supply; 4, construction of furnace casing; 5, lack of ventilation. Any one or more of these would result in the furnace radiating its heat in the cellar. The erection of a heating plant to suit the various conditions and to conform to the different constructions met with has to have careful consideration by the heating man, and the success of the furnace, so far as the work installed is concerned, depends upon his skill and knowledge. The furnace should be located as near the center of the house as possible, and the proper arrangement of hot air flues and registers should be carefully considered before work goes in.

They should be located with a view to getting the air into the rooms the shortest and most direct way. Their sizes should also be considered. The most exposed and remote rooms should have the largest pipes, while upstairs apartments should have smaller pipes for same sized rooms, the difference being about one-third. This difference is because of their hight and the rapidity with which hot air ascends. I would advise all registers for first story being in the floor and those for second story in side wall. It is expected that connection of ample capacity has been made with the several rooms to insure good work, and the proper fittings have been made. It is assumed that the furnace is of sufficient size to heat the house to the desired temperature in coldest weather. Its casing is an important factor. "C. E." describes one quite efficient to avoid loss of heat in cellar, provided its construction is such that it fits the furnace, *i. e.*, permits sufficient air to pass through between it and the furnace, and that the bonnet has ample space—at least 6 to 10 inches—between its top and top of radiator for an air reservoir. There should be at least 2 feet between top of furnace bonnet and under side of joist, 2½ feet being better, to insure longest pipes proper elevation. The cold air supply is of vital importance. There should be a cold air room built, about 6 x 8 feet for an eight or nine room house, with duct leading from same to furnace, and outside opening to admit cold air equal to combined sizes of all hot air pipes leading from the furnace. The outside opening should be covered with coarse wire screen and provided with regulating damper, all as per sketch. This will insure a positive air supply. As the rooms to be heated are full of air when we commence to heat them, it is necessary that there should be some provision for ventilation. A well ventilated room can be much quicker and better heated than one that is not ventilated, showing conclusively that if there is no way for the air to escape, the hot air pipes will stop bringing in hot air and establish a circulation with other rooms connected with the furnace, and by so doing the furnace would overheat the cellar.



Loss of Heat from Furnace.

Computing Furnace Capacity.

From C. J. A., *Denver, Col.*—In reading The Letter Box of your valuable paper of September 16 and December 23 I noticed inquiries for some simple way of finding the number of cubic feet of space that can be heated by a furnace having a given size fire pot and grate surface. I am a believer in a free exchange of opinions based upon practical experience that will help the dealer and pave the way to overcome some of the unnecessary evils that are met in every day competition, by educating the inexperienced furnaceman to figure on a furnace of ample capacity to do the heating of the job upon which he is called to estimate. The dealer having made himself familiar with the building and all its requirements, must then determine the size furnace capable of heating it. It is expected that the dealer knows the heating capacity of each size of the furnace that he handles, as the successful heating of a building lies in having ample capacity in the furnace, just as successful ventilation depends upon the size of the pipes or flues. The small size furnace and small pipes for feeding fresh and drawing off the foul air are the source of many failures. The size of furnace need not always be in ratio to the size of building, as much depends on the exposure, material of walls and the glass surface. While I know of no rule used by manufacturers in basing the heating capacity of the several different sizes and constructions of their furnaces, the generally considered important question is, What is the amount of the heating surface? It is not the amount of surface in a construction, but its relative value as heating surface in proportion to the size of the firepot. The general opinion is that the furnace which heats the largest amount of surface with a given amount of fuel, all things equal, is the most economical. Good heating surfaces, exclusive of the firepot, are those so located in the furnace that the products of combustion will be compelled in passing over them to impinge against and heat them. They must be of such form and so arranged that the air in passing through the furnace without being retarded will be compelled to impinge against them, for practically only that portion of the air passing through is heated which comes in direct contact with the hot surfaces. It has been my experience in selling and placing furnaces that those give the best results which have their surfaces located as described, or nearly so, with their radiator construction such as will compel the products of combustion to make an indirect passage through a drum, and not allow a direct passage from the firepot to the chimney. This keeps the radiator part of the furnace as hot or hotter than its firepot. A furnace which is constructed so that the firepot when in operation is its hottest part does all or nearly all the heating from the firepot. Air coming into a furnace at the bottom and passing over the hottest surface first is heated to such a temperature that the surfaces above cannot impart heat when the air already has a higher temperature than they have. Air increases in volume according to the degree of temperature to which it is heated. It must be understood that air is not heated by radiation, but by contact.

While I do not claim the following formula is a satisfactory one for all the different kinds of furnaces, and may be varied from 10 to 25 per cent. in regard to area of hot air pipes and cubic contents to be heated in residence work according to conditions, I do claim it a good one to figure furnace capacity in general work.

The firepot should be round and of a depth equal to two-thirds its diameter at top, and its grate at least within 4 inches of the diameter of firepot. For instance, to find the heating capacity of a furnace having a casing 45 inches diameter, with firepot 24 inches and grate 20 inches, square one-half the diameter of the firepot and multiply the product by 3½, and the result will give the area of the number of 10-inch pipes or their equivalent that the furnace will supply. The area of firepot multiplied by 40 will give the space in cubic feet that the furnace will warm. The following table will make my method more clear:

Table of Furnace Capacities.

Diameter of casing.	Diameter of firepot.	Number of 10-inch pipes.	Area of fire pot.	Area—cubic feet.
In.	In.	Sq. in.	Sq. in.	
36	20	4 = 312	314	12,560
40	22	5 = 390	380	15,200
45	24	6 = 468	452	18,080
50	26	7 = 546	531	21,240
55	28	8 = 624	616	24,640

Annealing Sheet Iron.—II

Past and Present Methods of Annealing Sheet Iron and Preparing It for the Market.

BY AMBROSE BEARD, CAMBRIDGE, OHIO.

Another furnace of recent design is that illustrated in Fig. 5. This furnace works with good effect. Instead of being fired at the side, as is usually the case, it is fired at the back. Note fire chamber A. The flame passes over the bridge with a down draft to passage B. It then divides and passes along the sides of the furnace and enters the annealing chamber D, through ports C. When in operation the furnace is made air tight by means of brick lined door, E. The smoke stack F is placed between two furnaces and it serves each in common. Boxes are loaded on track H and are moved forward upon the wrought iron carrier G. The idea in using this carrier is to take a loaded box to any furnace that is empty

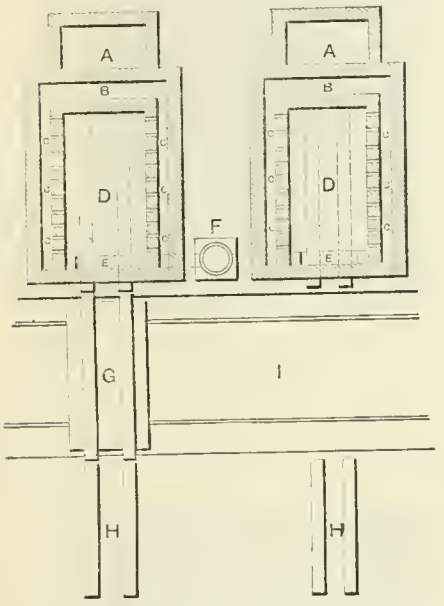


Fig. 5.—Ground Plan of Single Box Annealing Furnace Used for Sheet Iron and Black Plates for Tinning.

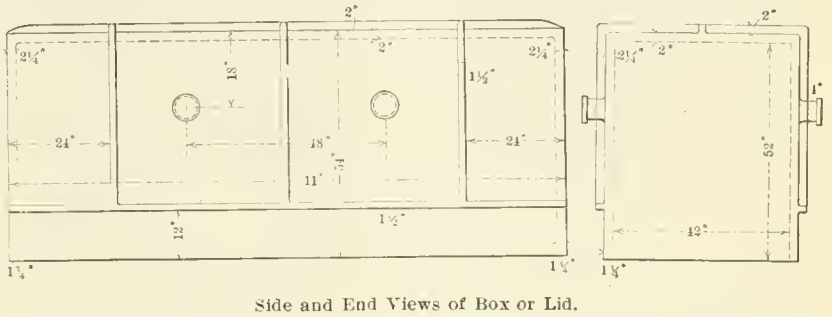
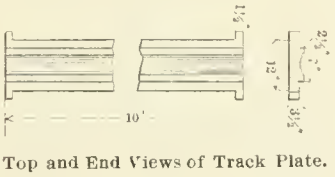
or *vice versa* to any vacant loading place. Any number of furnaces may be placed in line and operated in this manner. Carrier G is made very strong of I beams, with tracks fixed upon it of the same section as those inside the furnace and at the loading place. If it is required to move a box from one furnace to another, it is placed on the carrier G and drawn in either direction on rails laid in the sunken pit I. To insure perfect action it is desirable to allow the ends of the track plates on the carrier to overhang the sides of the pit about 6 inches, sufficient play being allowed to avoid obstruction. In following this plan all boxes or lids may be raised at one point, thus saving the expense of several hoisting devices. The boxes and their contents can be easily moved in any direction by using a strong chain attached to a fixed double purchase crab. Furnaces built in a similar manner to Fig. 5 are used extensively for annealing black plates for tinning.

Furnace Equipment.

After an annealing furnace is built there is considerable outlay required before it is ready for work. In Fig. 6 designs are shown of track plates upon which the weight is moved backward and forward, the carrier upon which sheets are piled, and the box, lid, or cover, as it is variously termed, which protects the sheets during the process and prevents oxidization. The only point upon which there is any wide divergence of opinion among mill managers is the respective use of cast and wrought iron boxes. There are many claims made in favor of each, but, as a matter of fact, both kinds are used in about equal proportions. The foundry man will argue in favor of cast iron boxes and the boiler maker will urge the use of wrought iron boxes. The equipment illustrated is used in the following manner: After the track plate is properly laid, cast iron balls

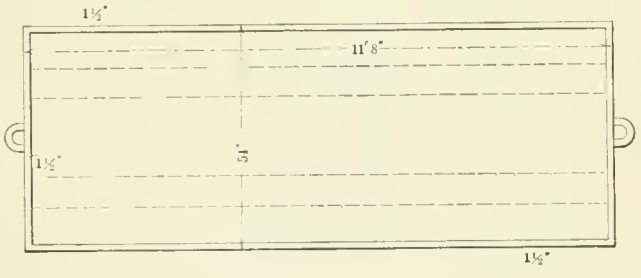


Side and End Views of Box or Lid.



Top and End Views of Track Plate.

End View of Carrier.



Top View of Carrier.

Fig. 6.—Annealing Box and Carrier.

are placed in the groove, about two feet apart, and upon them the carrier is set, the carrier having a groove on its under side corresponding with the groove in the track plate. Between these two grooves are the solid cast iron balls, made of a smaller size than the groove in the track plate so as to avoid binding. When the carrier is loaded with sheets, carefully piled so that the edges do not lap each other, the box is raised, then lowered over the pile of sheets until it rests firmly and squarely on the carrier. Air is then excluded by placing sand around the bottom of the box, and it is drawn into the furnace, where it remains for 18 hours or longer until properly annealed.

The means employed to raise and lower boxes vary. Generally a steel frame crane is used, as it can seldom get out of repair and is considered safe. Other hoists are used, which are generally constructed according to some local idea. To move the loaded boxes in and out of the furnace all that is necessary is a crab or winch. A loaded cast iron box, together with its carrier and contents, will sometimes weigh 25 tons. In double furnaces the total weight passed in and out would be 50 tons. This mass is usually moved by four men, two at the crab and two watching the balls to prevent them from locking if allowed to run loose, as they would sometimes do when the bed of the carrier is not level.

The equipment of annealing boxes illustrated in Flg. 7 is that used in annealing black plates for tinning. The method of operating is the same as described for sheet iron, except that it is on a smaller scale.

In both cases here referred to the life of an annealing box depends very much upon the treatment it receives. If it is subjected to extreme heat it will burn, and if, while hot, it is subjected to sudden cold it will more than likely crack. In some mills boxes burn out in three to four months, if made of cast iron, but the writer has known instances when boxes have lasted as long as nine months without a crack and six months longer after a patch of wrought iron was riveted on, making a life of fifteen months before becoming useless. If proper care is exercised when a box load of finished iron leaves the furnace and it is uncovered at a time when the rays of heat can be felt at a distance of three or four feet, the sheets will present a good color. If unloaded too soon they will turn red, and if allowed to get perfectly cold the center will be gray and the edges blue. Upon this the color very much depends. If proper care is taken a uniform color is easily obtained.

Experimental Annealing.

There has been a great deal of talk indulged in by sheet mill managers regarding the possibilities of radical

changes in annealing methods, but nothing of a very encouraging nature has yet developed in this line. It seems that, for the present at least, the art has reached a stationary condition. If no other reason can be advanced to support this theory, the reason that business is not in a condition at present to warrant experimental expenditure will hold good. Within the knowledge of the writer, the only steps taken toward making important changes in the acknowledged best method were attempts to anneal sheet iron without using a cast or wrought iron cover. If this could be accomplished and results obtained equal to those of the present practice, it would be a valuable innovation; but experiments have not demonstrated that this can be done. A furnace built with a lining of fire brick tile, around which the flame passed without entering the annealing chamber, has been tried, but the result of annealing was not of a successful character. There is really no serious cause for complaint as regards the modern method. It is cheap and effective, but slow. It is necessary to count on at least a week for filling a special order of box annealed sheet iron after the specification reaches the mill, even if the rolls are in condition to receive it, but it is safer to count on ten days. It is easy to figure on one day for rolling and three days for annealing, cooling and shipping, and this can be done, but with a book full of orders, each as urgent as the other, and exigencies to be met with, it is best to allow the full limit of time. Now, if some man can suggest or introduce a method of annealing sheets perfectly without using boxes and do the work as fast as sheets are rolled it will be worth looking into.

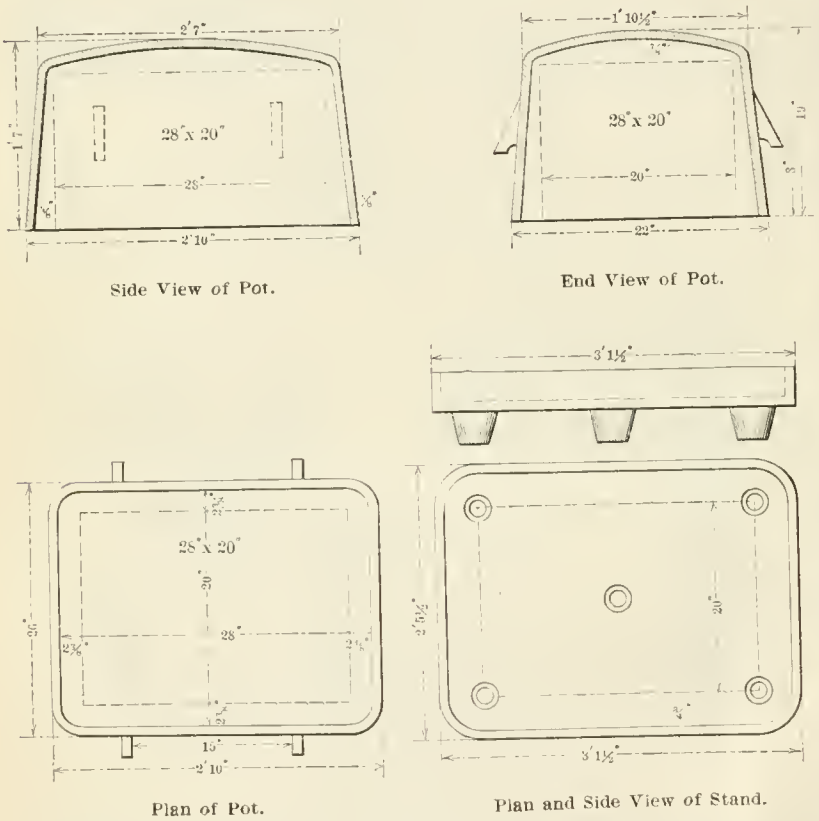


Fig. 7.—Cast Iron Annealing Pot and Stand for 28 x 20 Plates.

Pointers for Shippers.

The last man to handle sheet iron before it leaves the mill is not free from responsibility. The material may reach him in the best possible condition, but unless he takes proper care it will soon be in an unfit state for shipment. It is often the case that a shipper will allow workmen to sit upon piles of finished iron to eat their meals, spilling coffee, grease, &c., over the iron. This is a reprehensible practice. The greatest possible care should be taken to keep the sheets clean. A buyer may not say anything about it, but he will appreciate the fact that the mill sending out the neatest looking shipment must be best managed.

In marking bundles there is a great deal of difference noticed when the material reaches the warehouse of the jobber. It is a great mistake to cover the top sheet of a bundle with paint marks. Fig. 8 is a specimen of a daubed bundle.

The marking on this bundle is scattered all over it. The roller's chalk marks and name are still left upon it, and its general appearance is unsightly. A bundle marked in this manner would carry a bad reputation for the maker wherever it went. The tinner would tell the jobber not to send any more like it, and the jobber would place his orders elsewhere. It is not necessary to scatter the marks and brands. They should be concentrated at one end of the bundle, as shown in Fig. 9.

No other marks are necessary. The D in the left hand corner represents the roller's initial, so that if any complaints are made by the consumer regarding defects the trouble can be traced. It is as necessary to exercise care in shipping sheet iron as it is in shipping any other class of goods. A shipper should keep his warehouse tidy, and stack his bundles so that he can find a required size at a moment's notice. He should keep an account of all iron received and all iron shipped, and when January 1 comes he can check his inventory in ten minutes instead of having to employ half a dozen men for a week to move the material. The shipper who watches these points is casting bread on the waters. It has taken time and trouble to get the finished product to his department, and he cannot be too careful in applying the finishing touches.

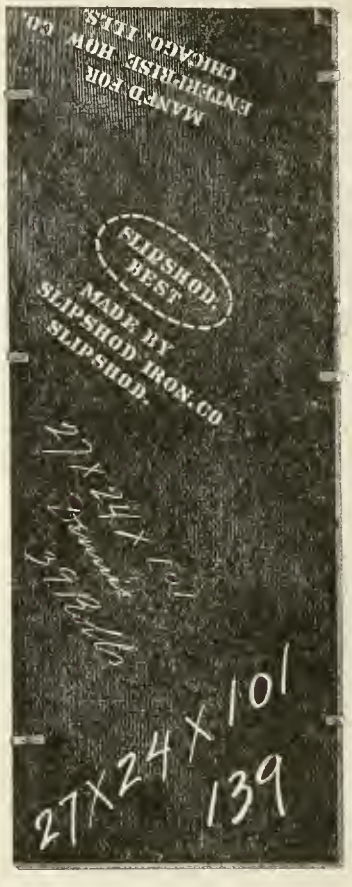

Fig. 8.—Improper Method of Marking Sheet Iron.

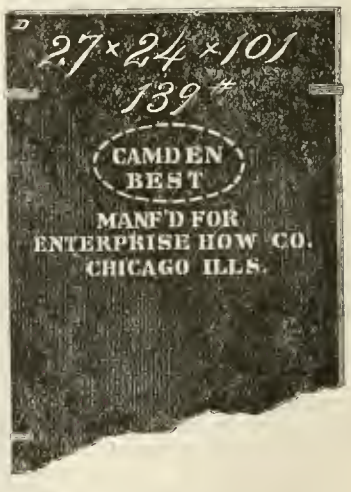

Fig. 9.—Correct Method of Marking Sheet Iron.

[THE END.]

Germany's naval experts have decided that the best color to paint their cruisers and torpedo boats, in order to make them as difficult of observation as possible, is a kind of dirty buff. They recommend that the whole of the vessels should be uniformly coated with this color, and that nothing on their decks or upper works should contrast with it.

PLUMBING and GAS FITTING.

Domestic Electrical Work.—VII.*

By W. A. W.

Burglar Alarms.

We have shown what an important part electricity may play in the saving of human life by giving timely warning in case of fire. There is yet another danger that it is well to guard against—the midnight prowler, who enters the dwelling while all its inmates are asleep and plunders everything within reach, not infrequently ending with assault or murder. This danger is even more to be feared than fire in some instances, for here we have all the cunning of which human nature is capable to guard against.

There is for this no more reliable protector than electricity. It is a ceaseless, never sleeping sentinel, always on duty and ever ready to give warning at the slightest attempt at intrusion.

In installing a system of burglar alarms, it should be born in mind that it is both safer and more agreeable to scare a burglar off than to fight him off, and the system that will most successfully accomplish this comes the nearest to being perfection; at least, that is the writer's view of it. Another point to look after carefully is to conceal all wires, batteries, &c. Knowing full well that the average burglar is possessed of a great deal of ingenuity and cunning, too much importance cannot be attached to this part of the work. The writer has found burglar alarm systems installed in quite pretentious dwellings where the battery was set on a shelf at the head of the cellar stairway, and the switch placed on the inside of the cellar door casing, with no connection on the cellar door or windows. A burglar entering this house through the cellar would at once divine the object of this battery and switch, and if he was possessed of the slightest reasoning power would, before proceeding further, disconnect these and keep silent the obnoxious bell. A system installed in this manner is simply ridiculus. It is worse than none at all, for while the occupants are sleeping in fancied security a burglar may be ransacking the house, and next morning burglar alarms in general will be condemned as useless "fakes." The writer cites this case in order that the beginner in this class of work may guard against committing a like folly.

The battery, annunciator and switch should be located in the chamber occupied by the head of the house. The battery and switch can be placed in a closet which opens into this room only, so that nothing but the annunciator need be seen, and in no other part of the house should the slightest suspicion of a burglar alarm be visible. In addition to the ordinary door and window connections, electric burglar alarm floor matting may be used. This is an article that beats the craftiest of burglars or sneak thieves. The latter is perhaps the hardest of all dishonest persons to guard against. He is watching your every movement, sneaking in as you go out and sneaking out as you come in, leaving no trace behind him except the loss of what he has pilfered. But this electric matting watches his footsteps and gives warning of his presence. This is placed under the carpet, and no sign of it is visible on the surface. It can be put in front of doors, under windows, in the center of the room, on the stairway; it can be so placed that it will be impossible to step from one room into another without causing an alarm. In order to make the scaring off plan more effectual, where gas is used an automatic electric gas burner may be included in the circuit in each room, so that at the first attempt to enter the house the gas is automatically turned on and lighted, and it is safe to say that any burglar will take to his heels with the ringing of a bell in the house and the light of a gas jet flashing in his face.

Fig. 14 shows a burglar alarm circuit with five connections. The heavy lines indicate the battery wire and the light lines the return wires. The dotted line indicates the wire running from battery to annunciator to operate the continuous ringing attachment (with which every burglar alarm annunciator should be provided). A is the annunciator and B the battery. Where more than one opening is connected from the same room all the return wires from that room should be spliced together and but one wire run to the annunciator and connected to the name or number corresponding to the room.

A switch must be connected to the battery wire so that it can be switched off to permit of the opening of doors and windows during the daytime. For window connections there is perhaps none better than what is known as the ventilating window spring. It possesses the advantage of permitting a room to be ventilated in warm weather without interfering with the alarm. By raising the window a little higher than it is intended to be left and then drawing it down to the desired hight, say, for instance, so that a man cannot crawl through without moving it, the alarm is in proper position. The window can at any time be closed entirely without in the least disturbing the alarm, but the slightest upward movement of the window closes the circuit and sets off the alarm.

The burglar alarm system just discribed is the one usually adopted for nearly all classes of buildings, but there are cheaper as well as more expensive systems. A cheap, and at the same time very serviceable system, may be installed in the following manner: Make a complete circuit about the

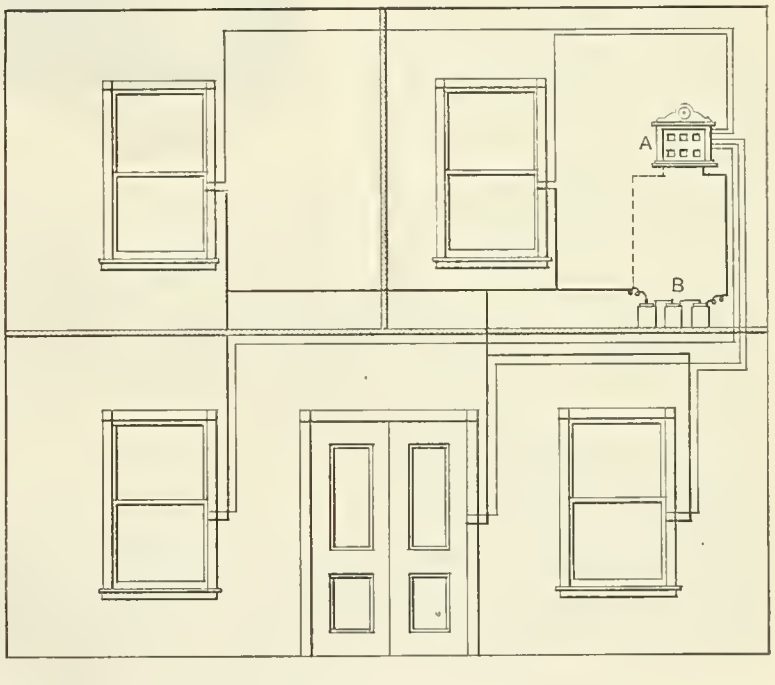

Fig. 14.—Burglar Alarm Circuit.

building with the wires. Use an ordinary electric bell (a large size, however). Start one wire from the battery, the other from the bell, terminating their ends in one of the connections. Now from each door or window connection run one wire and splice to the return, and one to the battery wire; then running a wire from the battery to the bell completes the job. This makes a very inexpensive alarm, and will indicate an attempt at housebreaking just as effectually as a more expensive system, the only inconvenience being that there is nothing to indicate in what part of the house the attempt is being made.

The most perfect, and in some cases almost indispensable, system is the combination annunciator and automatic clock work cut out. With this instrument the system may be so arranged that where servants or others arise earlier than the family the clock work automatically cuts out the desired sections at any hour it is set for, so that doors or windows may be opened in such parts of the house with out disturbing any one where the annunciator is located.

* Copyrighted, 1893, by David Williams.

Thus far the work described has been such that the intruder could not gain access to the system of wiring without first causing an alarm. We have, however, another class of work wherein the electrician must exercise even more caution in installing the apparatus—that is, safe and desk alarms. It may be desirable to protect a safe or desk so that its improper opening will cause an alarm, and here the only reliable system to use is the closed circuit system. The safe breaker is very clever and he may have opportunity of discovering the wires of an electric alarm, which by properly cutting he may render useless and proceed with his work undisturbed if the open circuit is used. With the closed circuit this last recourse is denied him. If he disturbs the circuit in any manner by cutting a wire or disconnecting the battery the alarm is sure to sound; if he opens the door of the safe or the desk the same thing will happen; he is confronted with a case of "hands off." All connections used in this work must, of necessity, operate just opposite to open circuit connections—that is, on being disturbed, they must open the circuit instead of closing it.

An ordinary electric bell is used, the battery consisting of one open and one closed circuit. The open circuit battery is connected with the bell in the usual manner of putting up an electric door bell, except that the circuit is continuous without any break. The closed circuit battery is connected with the alarm connections and the coils of the bell, and when in position for work is also a continuous circuit without break. Note, however, that this circuit is connected only to the coils of the bell, so that the current from the closed circuit battery will circulate continuously through the coils. This will cause the armature (which carries the hammer) to be held tightly against the magnet, thereby keeping open the open circuit battery by holding the armature away from the contact screw. The moment, however, any of the burglar alarm connections are tampered with and the closed circuit opened the armature is thrown back by its spring, and coming in contact with the screw closes the open circuit battery, causing the bell to ring until the current is switched off or the battery runs down. One important advantage this system possesses is that if anything gets out of order it rings an alarm at once.

To Organize Maine Plumbers.

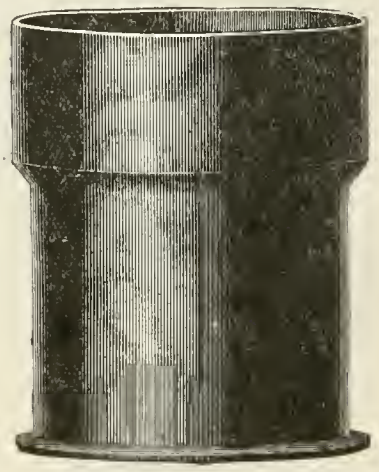
Daniel G. Finnerty, president of the National Association of Master Plumbers, is sending out the following notice to the master plumbers of the State of Maine:

To the master plumbers of Maine who feel the need of organization to insure a higher class of workmanship, more harmonious relations between each other, and such protection as only the National Association of Master Plumbers can extend, I wish to say: In company with the State vice-president of Maine, Jno. B. Smith of Lewiston, I will visit Bangor, Monday, January 22, and hold a meeting at the Bangor House at 3 p.m.; Augusta, Tuesday, January 23, meeting at the Coney House, 3 p.m.; Lewiston, Wednesday, January 24, meeting at Hotel Atwood, 9 a.m.; Portland, Thursday, January 25, meeting at the Preble House, 2 p.m.

Master plumbers in cities and towns adjacent to either of the above cities are most cordially invited to be present and take an active part in the proceedings, intended for their mutual benefit. An association of master plumbers will be formed in each of the above cities, and every master plumber is invited to affiliate.

Cold Drawn Brass Ferrule.

The illustration presented herewith shows a plumbers' brass ferrule, made by Randolph & Clowes, Waterbury, Conn. Being made by a new process, these ferrules, it is said, are perfectly smooth and true in size and shape,



Cold Drawn Brass Ferrule.

which saves the plumber a great deal of time and labor. They are made from seamless drawn brass tubing, which prevents the possibility of blow holes or sand holes. Manufactured in this way, it is said that they have greater strength and are of light weight. Their smoothness enables them to be tinned readily, or they are furnished already tinned when desired.

Master Plumbers at the Trade School.

At 3.30 p.m. last Tuesday Superintendent John Delehanty assembled the day class in plumbing in the lecture room of the New York Trade School to meet the committee from the Master Plumbers' Association of New York. R. Fulton Cutting explained, on behalf of the school trustees, that this committee was interested in seeing that the class received such instruction as would make them qualified plumbers, and had given much time and thought to the assistance of the trustees. The members of the committee are Edward Murphy, Col. Geo. D. Scott, Frank Reynolds, Thos. J. Tuomey and James Muir, who were all present and made addresses. Mr. Murphy outlined the examination that would be made at the close of the term, so that the class might know what to expect and prepare for it, and their ability to pass a good examination would be evidence of a store of knowledge that would be daily needed by them as working plumbers. James Muir contrasted the opportunities of a young man learning a trade now and in the past, counseling the class to make much of the chance to draw upon the experience stored at the school. In their work after leaving they would never again be able to readily find valuable information, but would be left to their own resources and expedients. Colonel Scott advised them to study the construction of buildings, so as to be able to meet the requirements, rather than to adopt one system of plumbing for all work and to depend on some one else to lay out their work. Frank Reynolds explained the high grade of work that had been done by the classes in the past, and encouraged the new class to follow the instructions given and they would be able to keep their work up to the standard. Mr. Tuomey made no address other than to greet the class. Among others present were Mr. Brady of Byrnes & Brady, Harry Brill and J. Stanley Thomas.

Kelly's Frost Proof After Flush Water Closet.

Thomas Kelly & Brothers, 124 Franklin street, Chicago, are putting on the market Kelly's Frost Proof After Flush Water Closet, which is herewith illustrated. The trap and valve are placed below the floor, which is presumably so constructed that all danger from frost is avoided. When the closet is occupied the inlet side of the valve is opened and the discharge side closed, thus allowing the water to pass up into the tank as far as the water pressure will condense the air. With a pressure of 40 pounds the tank will be filled two-thirds full of water. Upon the seat being released the weight causes it to raise, and the connecting chain lowers the valve weight, thus opening the outlet valve and closing the inlet. The pressure of compressed air in the tank drives the

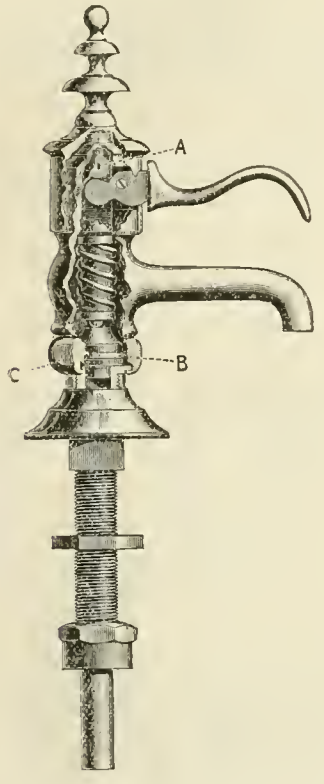
Kelly's Frost Proof After Flush Water Closet.

water into the closet with sufficient force, it is pointed out, to thoroughly flush it and wash its contents into the sewer. The lower the tank is placed the greater will be the force of the after flush. It will be seen that the

tank contains water only when the closet is in use, so that there is no chance for it to freeze.

The Porteous Self Closing Basin Cock.

The accompanying illustration shows a broken view of the Porteous self closing basin cock, manufactured by the American Brass Works, Cincinnati, Ohio, and recently put on the market. Referring to the illustration. A is a



The Porteous Self Closing Basin Cock.

wheel in the slot where the lever works and which causes very little friction, thereby being easily operated. B is a loose seat or disk, which may be lifted out by unscrewing the nut C. In this way a new seat may be inserted and the cock can be repaired at small expense. All the joints are said to be metal to metal, with no rubber used in putting the cock together, the only non-metallic material employed being the washer on the end of the stem.

TRAPS AND VENTS.

THE MASTER PLUMBERS' ASSOCIATION OF HOLYOKE, MASS., has chosen T. J. Carmody president and Charles P. Lyman secretary and treasurer. There are 12 plumbing firms in the local association.

THE MASTER PLUMBERS' ASSOCIATION OF NEW BRITAIN, CONN., has made arrangements to attend the State convention to be held in Hartford on February 15.

M. W. RYAN & CO. are a new firm in the plumbing business at 1114 Adams street, Toledo, Ohio. Mr. Ryan has an experience of 30 years and has done the work on many fine buildings in that locality.

A CORRESPONDENT STATES that the outlook for plumbing in Philadelphia is brightened by the extension of the trolley system of street car service. They are required to pave and repave all streets before putting down their tracks, and owners of property not heretofore connected with the sewers are compelled to make connection before the new pavements are put down.

ZACK & MYLIUS have bought a lot on North Broadway, Aurora, Ill., and will begin building operations at once. They will occupy the new structure with their plumbing business.

A MEETING of the Master Plumbers' Association of Cleveland, Ohio, was held in the rooms of the Builders' Exchange in the Arcade recently, and considerable routine business was transacted. The following officers for the ensuing year were elected: President, G. S. Papworth; vice-president, D. H. Roberts; treasurer, S. W. Burrows; secretary, L. Bonesteen; sergeant-at-arms, W. H. Cleveland; delegates to the State convention at Toledo, February 14, J. Schneeberger, W. H. Henderson, D. H. Roberts, W. J. Warden, Charles Streever. The advisability of the enactment of a State law regulating plumbing was strongly urged.

THE Brockton, Mass., board for examining applicants for plumbers' licenses, consisting of Dr. Frost, Clarence L. Mitchell and T. J. Kinney, had 14 applicants before them last week.

THE TORONTO STEEL CLAD BATH & METAL COMPANY, LIMITED, Toronto, Canada, distribute a very pretty illustrated catalogue relating to their Steel Clad baths. The cover, with lettering and embossed design, is printed in gold and red, giving a handsome effect. There are illustrations of the Steel Clad bath, with descriptive particulars and table of sizes and prices. Also a varied line of bath and basin cocks and other specialties.

ONE who is taken as an authority on trade education in England, H. H. Cunynghame, in championing the cause of technical lectures for workmen in that country, remarked recently that it was an absurd idea to imagine that mere "book education" would make a good workman. Steadiness and application he considered of infinitely greater value to the workman than any amount of literary instruction. As reported in the London *Plumber and Decorator*, he remarked further as follows: "Surely it is better for a plumber to solder straight than to spell correctly. I honor the plumber who spells badly, if only he solders well! Of course, it is best to do both well, but if a man is to gain a livelihood as a mechanic, it is necessary that his attention shall be concentrated on mechanics."

AT THE RECENT MEETING of the Board of Freeholders of Mercer County Prosecutor Bayard Stockton made application for an appropriation to ventilate the court room. Before the meeting Prosecutor Stockton appeared before the Court House Committee and explained in detail a plan to ventilate the room at a small cost. The intention is to conduct fresh air into the room by a number of pipes and circulate the air by electric fans. The Prosecutor estimates that the much needed improvement can be completed for less than $300.

THE MASTER PLUMBERS' ASSOCIATION OF NEW BRITAIN, CONN., recently elected the following officers: President, P. J. Toomay; vice-president, S. W. Damon; secretary, Fred Horsfall; treasurer, J. B. Weiant; trustees, Messrs. Damon and Brady.

THE MASTER PLUMBERS' ASSOCIATION OF TOLEDO, OHIO, elected officers for the ensuing year as follows: President, John A. Waite; vice-president, James W. Gould; secretary, Wm. G. Wacker; treasurer, Frank J. Kern; Executive Committee, James W. Gould, James Locke and Thomas Manlon. The Toledo association will entertain the State organization at its annual meeting, to be held February 13,

C. C. ERHARD has leased the north room of the Willaman-Schworm Block, on South Erie street, Massillon, Ohio, and on February 1 will open a plumbing and steam fitting establishment. Mr. Erhard is a son of Karl F. Erhard.

ADAMS & RIDER, Helena, Mont., have purchased the entire stock of the Helena Steam Heating & Supply Company, and have added it to their already large line.

NEARLY all of the business transacted at the recent convention of the master plumbers of the State of Massachusetts at Boston was in executive session. Eighty-three delegates were present, and a committee consisting of the presidents of the local associations was appointed to carry out the plans of the convention. The next convention will be held at Holyoke, Mass., on the second Tuesday in May. Though the association is but nine months old, the State is well represented and steps are to be made to increase the membership.

THE RECENT BALL of the Boston Master Plumbers stands first in honor of those given by the association. Fifty couples from out of town enjoyed the supper and took part in the dance.

STATE VICE-PRESIDENT DEEDY of the Massachusetts Master Plumbers of Worcester was at Waltham on the 18th to organize an association of master plumbers.

VICE-PRESIDENT JOHN MITCHELL of the National Association of Master Plumbers has been elected president of the New York Master Plumbers' Association and has a good corps of officers to extend the good work of this association.

JAMES F. TRAYNOR, one of the enterprising plumbers of Wilmington, Del., recently paid a visit to the trade in New York.

THE SHUSTER FOUNDRY COMPANY, Philadelphia, Pa., announce by a blotter sent to the trade, the "Plumbers' Vest Pocket Health Office Register," issued by them in 1890, has been so popular that it will be reissued this year with a full and complete price list. An invitation is extended to visit their plant to see the new and labor saving soil pipe fittings that can be best appreciated on examination.

THE LEXINGTON PLUMBING COMPANY of Lexington, Ky., recently elected the following officers: M. P. Lancaster, president; J. T. Slade, vice-president; W. Scanlon, secretary; E. D. Sayre, treasurer; J. H. Davidson, general manager; S. T. Campbell, superintendent. Directors: J. T. Shelby, T. D. Mitchell, R. D. Williams, J. W. Sayre, J. H. Davidson, M. P. Lancaster, J. T. Slade.

CHARLES SCHLOESSER, 1782 Lexington avenue, New York, is the recording and corresponding secretary, and Alexander Bryant of Macdonald & Co., 296 Third avenue, is the financial secretary of the Master Plumbers' Association of New York for the new year.

THROUGH the kindness of the newly elected financial secretary, John Kelly, we receive a list of the officials of the Brooklyn Master Plumbers' Association for the ensuing year: President, Martin Fallon, 53 DeKalb avenue; vice-president, Charles W. Evans, 5 Reid avenue; recording secretary, Wm. J. Gault, 509 DeKalb avenue; financial secretary, John Kelly, 99 Smith street; treasurer, Geo. B. Lewis, 660 Fulton avenue; marshal, John J. Keenan, 39 Raymond street; sergeant-at-arms, Oscar O. Sawkins, 357 Court street. Trustees: Edwin Hayward, George Cummings and Joseph Zoll.

PECK BROS. & Co., manufacturers of fine brass goods, sanitary specialties and plumbers' supplies, 259 Wabash avenue, Chicago, have just completed a thorough renovation of their showroom. It will well repay any interested plumber or architect who wishes to see the latest achievements in sanitary plumbing to call and examine this display. It can be frankly said that the window arrangement as a whole is one of the finest and most attractive, showing judgment, taste and an unlimited stock to select from. The floor of the window is covered with cream colored tile, having a deep rich border of arabesque pattern, forming a suitable setting for the onyx and choice marble lavatory and drinking fountain display. Among the articles shown are the new Boyd lavatory; the Triple Jet syphon closet; enameled iron bath (Roman shape), handsomely decorated in colors, and the solid porcelain English bath. On all the above goods are shown the firm's nickeled brass fixtures in special design. The whole display is finely set off by an elaborate network of brass at least 10 feet high, showing in plain relief in the fret work the words "Peck Bros. & Co."

THE A. Y. MCDONALD COMPANY, 168 Lake street, Chicago, have secured the agency of the Perfection Cleanout Company, Haverhill, Mass., and will carry a full line of cleanouts in quarter bends and straights, for 2 to 6-inch pipe, in both standard and extra heavy qualities. These cleanouts have a screw clamp to hold the cover in its place and make it fit tight. The hole is large enough to make the full width of the pipe accessible.

AN ADJOURNED MEETING of the Board of Health of Paterson, N. J., was held last Monday evening, for the purpose of hearing the views of the master plumbers on the bill to be submitted to the Legislature to be enacted as a law for the government of plumbing throughout the State. As a result the Master Plumbers' Association have been asked to appoint a committee to confer with the Board of Health and journeymen plumbers who drew up the bill, and a meeting will be held at the office of Dr. Leal of the Health Board next Monday night. Plumbers from different parts of the State have been present at the meetings.

D. W. YARBROUGH has bought the interest of his partner, T. R. Stephenson, and will continue the plumbing business in his own name at the old stand, 18 East Hunter street, Atlanta, Ga. Mr. Yarbrough is a well known Atlanta young man. He is a practical plumber, having had nine years' experience, and is a graduate of the New York Trade School.

THE CITY OF ALBANY, GA., has passed an ordinance for regulating plumbing and house drainage that is up to the ideas of the time.

ASHTON & GERAGHTY, Waterbury Coun., have been awarded the contract for plumbing the parochial residence of the Sacred Heart Church.

GEO. FOX, JR., has opened a plumbing establishment in the basement of the Sons of America Hall, south of railroad, at Wayne, Pa., and still retains his office on North Wayne avenue.

D. S. PAUL, a plumber, of Atlanta, Ga., so it is reported, is designing plans for the erection of a tower 1150 feet in hight for the Atlanta Exposition.

MORE THAN 100 DELEGATES are expected to attend the State Convention of Master Plumbers, at Toledo, Ohio, on February 13, and the local association are busy preparing for their reception and entertainment. If the weather permits the delegates will be taken for a drive. One of the famous theatrical entertainments of the Owl Yacht Club will be another diversion. The State officers are: L. Poplowsky, Cleveland, president; Robert Raitz, Toledo, vice-president; C. C. Dewstoe, corresponding secretary, Cleveland; L. E. Huddleson, financial secretary, Columbus; William Halley, treasurer, Columbus. These, with John A. Waite, Toledo; D. N. Kelley, Columbus, and H. M. Stowe, Marion, comprise the Executive Committee.

British Tin Plate Exports for 1893.

The returns of the British Board of Trade for December, 1893, include the following statistics of the exports of tin and terne plates from Great Britain for that month and for the entire year as compared with those for the two previous years:

Shipments to.	Exports in month of December, in tons.			Exports for entire year, in tons.		
	1891.	1892.	1893.	1891.	1892.	1893.
United States	13,536	23,417	14,031	325,143	278,477	255,583
Russia	5,317	4,434	2,723	30,802	27,914	30,526
Germany	405	394	268	2,704	3,951	3,137
Holland	329	377	522	4,830	4,386	5,323
France	868	655	823	6,242	9,433	11,321
Portugal (Azores and Madeira)	418	408	256	4,618	5,183	5,861
Italy	764	448	326	8,332	6,873	4,004
Roumania	..	....	....	3,988	4,560	4,286
Brazil	508	434	141	4,810	6,073	4,340
Argentina	93	418	245	3,572	3,085	3,302
East Indies	761	453	790	4,148	4,507	6,198
Australasia	1,348	734	1,012	10,497	7,927	7,704
British North America	1,727	969	1,195	19,935	14,826	16,000
Other countries	2,336	1,287	1,492	18,958	18,238	21,648
Totals, in tons	28,410	34,428	23,824	448,379	395,449	379,233

It will be seen from the above table that the total shipments of tin and terne plates to the United States last year were 22,894 tons less than those in 1892, while they in turn fell short of 1891 shipments by 46,666 tons. Taking into consideration the trade depression of last year, which unquestionably caused a material curtailment of imports, and setting it against the increase in consumption of tin plates which develops annually in the United States, it is fair to infer that they would about balance each other. The deficit in imports for the year 1893 would, therefore, be filled by the plates of domestic manufacture, which have been produced to about that amount during the year.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

BIDS WILL BE RECEIVED by Philip T. O'Brien, chairman of Building Committee, up to January 24, for a warming, ventilating and sanitary closet system to be used in a four-room school house to be erected at Clinton, Mass.

LYNCH & WOODWARD, Boston, Mass., are installing the heating plants in the Industrial Trust Company's new building, at Providence, R. I., and the handsome residence of Mrs. Leopold Morse, at Danvers, Mass., using Exeter radiators.

JOSEPH L. WHELAN, the plumber, of North Broad street, Elizabeth, N. J., has the contract for the plumbing and gas fitting in the new building being erected for John F. Rogge.

DUFFEY BROS., 117 Sutter street, San Francisco, Cal., are one of the representative plumbing houses of the Pacific Coast, and make a specialty of fine work and goods. One of the contracts completed by them last year was the erection of all of the plumbing fixtures and sanitary work for the Midwinter Fair Buildings. Another large contract which they filled was at the University buildings at Palo Alto.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until February 13, for a low pressure return circulation steam heating and ventilating apparatus for the United States Post Office building at Fremont, Neb. Drawings and specifications may be obtained from the Supervising Architect, Washington, or at the office of the superintendent, at Fremont.

THE KELLY & JONES COMPANY, 48 to 52 North Clinton street, Chicago, have contracts for steam heating in the Calumet Club Building, Michigan avenue and Twentieth street, and the Aldine Apartment Building, Aldine street and Evanston avenue.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until February 8, for low pressure steam heating and mechanical ventilating apparatus, elevator power boiler, &c., for the United States Court House and Post Office, &c., building, at Troy, N. Y. Drawings and specifications may be obtained from the Supervising Architect, at Washington, or from the superintendent, at Troy.

THE ILLINOIS HEATING COMPANY, 88 Lake street, Chicago, are to furnish hot water heating plants for the residences of W. J. Bridgeman, Woodlawn avenue and Forty-sixth street; James Hay, Homan avenue and Adams street; T. A. Norton, Austin, Ill.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, are to furnish two horizontal tubular boilers and steam heating plant for the Pulaifer Building, Calumet avenue and Twenty sixth street. The boilers are also to supply power for pumping, elevator and electric light service.

THE DEPARTMENT OF PUBLIC PROPERTY of Easton, Pa., at a meeting held January 12, decided to advertise for proposals for steam and hot water plants for heating the three engine houses.

The framers of the Wilson bill, says the Troy *Times*, having classified hydraulic hose, which is used exclusively for extinguishing fires, among articles of wearing apparel, no doubt will remodel that extraordinary measure so as to include hydraulic rams and spinning mules in the live stock schedule.

ROOFING AND CORNICE.

The Sanders Skylight Chart.

BY H. M. SANDERS.

The following is a description with illustrations of a chart I have used for scale, and for the purpose of illustrating its working I have used a pitch of skylight that is about 7 inches to the foot; but any other pitch of skylight is equally applicable. For practical use in the shop the chart should be drawn full size in order to secure accuracy in laid out, as regards spacing off and locating the position of the bars. As the chart indicates, all measurements are taken from the curb line of the skylight.

It will be observed that the chart is triangular in form and its base, A B

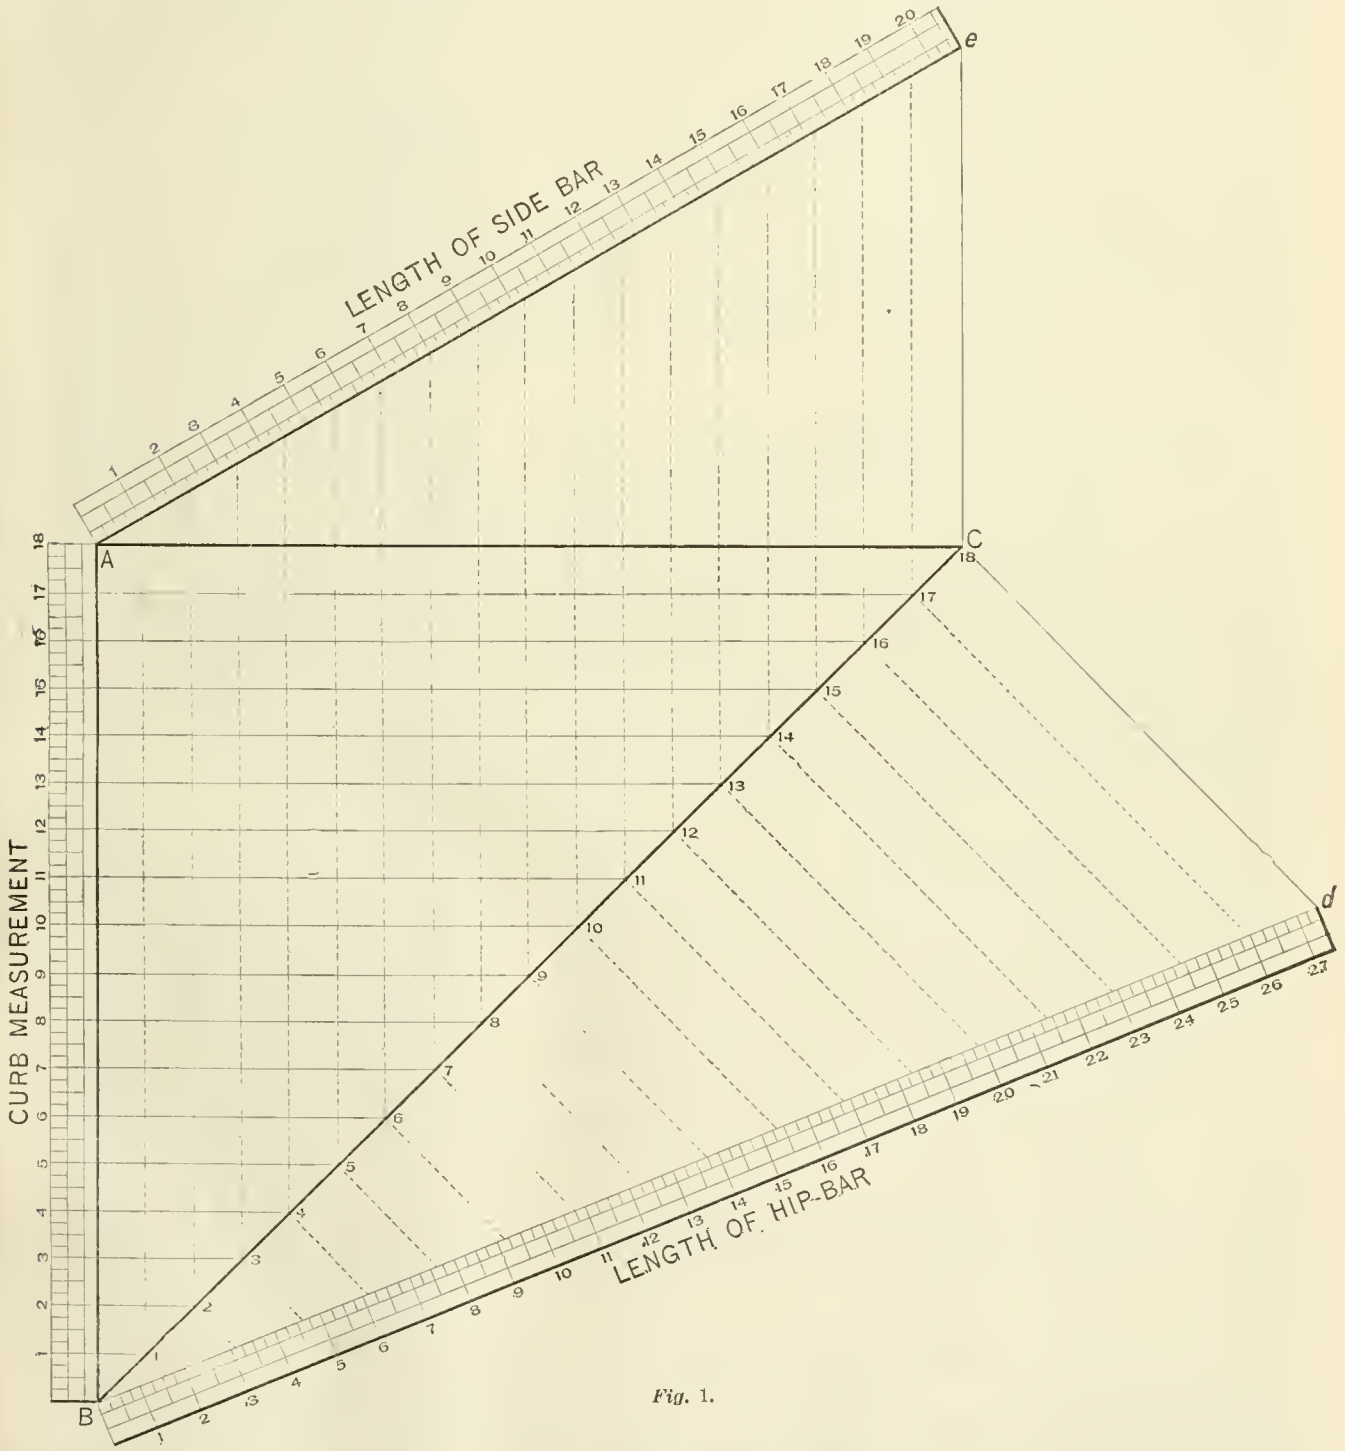


Fig. 1.

THE SANDERS SKYLIGHT CHART.

obtaining directly the length of bars for a hip skylight.

It will be observed that for convenience in publishing this chart in *The Metal Worker* it is drawn on a ¼-inch

determining the length of the various bars required.

The use of the chart as shown in Fig. 1 presupposes that the ground plan of the skylight has been properly

C, a right angle triangle, and the same as one-half of the ground plan of the end of a skylight. A B, as the base of this right angle triangle, represents the curb or measuring line of the skylight.

The line A C represents the ground plan of the side bar C *e*, drawn at right angles with A C and of sufficient length to give A *e* the proper pitch of the skylight. On this line A *e* we have laid off a rule or measuring bar representing inches and quarter inches, by which to determine almost at a glance the length of bar required at any given point. In the same or like manner, B C represents the ground plan of the hip bar. At point C we draw the line C *d* at right angles with B C and of the same length as C *e*, and this gives us B *d* on which to lay off our measurements for the hip bar. Draw lines from the measurements laid off on the curb line A B and interaect them with hip line B C at points 1, 2, 3, 4, &c., and from these various points for the hip bar continue these lines at right angles with B C and intersect them with the line B *d* as points of measurement. For the side bar draw lines from these same points 1, 2, 3, 4, &c., on this same line B C and at right angles with A C, intersecting them with the line A *c*. Thus we have eatablished A B as the measuring line of the curb of skylight, A *e* as the measuring line of the side bar, and B *d* as the measuring line for the hip bar.

A little practice will enable one to read readily the length of any bar required. While the measurement of the curb is on the line A B, the points 1, 2, 3, 4, &c., on the line B C represent so many inches respectively of the curb measurement. To illustrate: In Fig. 2 we have represented a skylight 2 x 3 feet. The curb measurement of this skylight, being one-half of the end of the same, is 12 inches. Referring to the chart, 12 inches is the curb measurement, or as shown by the number 12 on the line B C. Follow the dotted line from point 12 on B C to its intersection with line A *e* and it gives us 13¾ inches as the length of side bar, as shown by A C in Fig. 2. To find the length of the hip bar, as shown by B C in Fig. 2, we follow the dotted lines drawn from the same point 12 on line B C of the chart to its intersection with B *d*, and we have 18⅜ inches as the length of the hip bar B C, as shown in Fig. 2.

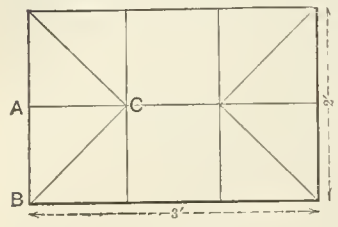

Fig. 2.

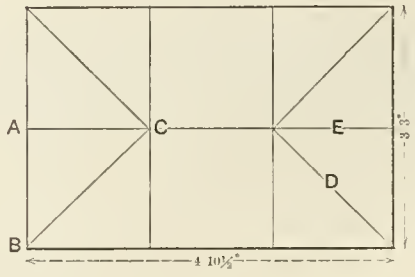

Fig. 4.

Let us suppose now we wish to find the length of bars for a skylight that is larger than is represented on the chart. For example, we have shown in Fig. 3 a skylight 10 feet square. In this skylight we want to find first the length of the hip bar K. The distance A B of this skylight represents one-half of the width of the skylight, or 5 feet, as the curb measurement to be applied to the chart. But we find that the chart does not cover 5 feet in length of curb measurement, so we take some number that is represented and that will go into 5 feet, or 60 inches, a given number of times. The highest number on the chart that will do this is 15 inches. Fifteen inches will go into 60 inches just four times. We find by referring to the chart that 15 inches curb measurement gives us 22⅝ inches as the length of the hip bars, as shown on line B *d*. Twenty-two and seven-eighths inches multiplied by four gives us 91½ inches, the length of hip bar K in Fig. 3. To get the length of side center bar D of Fig. 3, we find that the curb measurement of 15 inches gives us on the side bar measurement on line A *e* 17¼ inches. Seventeen and one-quarter inches multiplied by four gives us 69 inches for the length of this center side bar D.

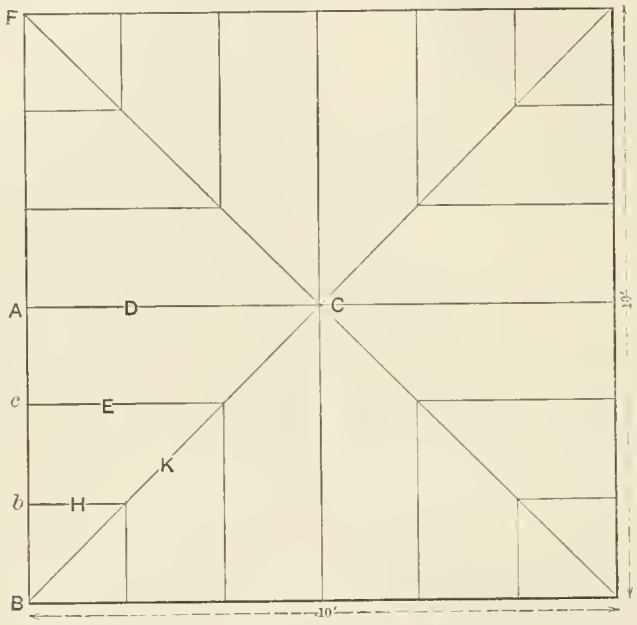

Fig. 3.

To get the length of the bars H and E, as shown in Fig. 3, we find first that the curb measurement for the H bar is represented by B *b*. B *b* is one-sixth of the distance from B to F, and as B F represents 10 feet, or 120 inches, B *b* is one-sixth of 120 inches, or 20 inches. Twenty inches, then, is the curb measurement from which to determine the length of the bar H. Twenty inches not being represented on the chart, we take the measurement of two numbers that are its equivalent, two tens. Ten inches curb measurement gives us on the side bar A *e* 11½ inches, which multiplied by 2 gives us 23 inches as the length of bar H. To get the length of the bar E, the curb measurement B *c*, as shown in Fig. 3, being twice as long as B *b*, the length of the bar E would be twice as long as the bar H, or 46 inches.

This same principle applies alike in the development of these bars in all cases and in hip skylights of any size or dimension, bearing in mind, however, that the curb measurement of the bar is always the distance from the center of the bar on the curb line to the corner of the skylight, as shown respectively by *c* B and *b* B in Fig. 3.

Suppose now we take an odd size skylight, as shown by Fig. 4. This skylight is 3 feet 3 inches wide, or 39 inches. This would make the curb measurement 19½ inches. As 19½ inches is not represented on the chart and is not divisible by any number of inches

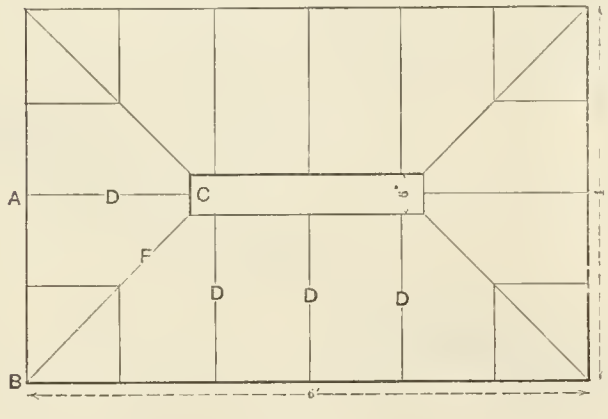

Fig. 5.

THE SANDERS SKYLIGHT CHART.

it represents, we take the sum of two numbers that represent 19½ inches, and added together will give us the length of bar required. For example, let us take any two numbers, as 15 and 4½, which, added together, will give us the length required for the bars D and E, shown in Fig. 4. We find that 15 inches curb measurement on the chart gives us for the length of the hip bar on line B *d* 22⅞ inches, and 4½ inches curb measurement gives us on the same line B *d* 6⅞ inches, and these added together give us 29¾ inches as the length of the hip bar D in Fig. 4. In like manner 15 inches curb measurement on the chart gives us 17½ inches on side bar measurement A *e*, and 4½ inches curb measurement gives us on this same line A *e* 5⅜ inches, which added together give us 22⅞ inches as the length of the side bar E, Fig. 4.

Thus far it will be observed that the length of bar developed has been in skylights with no ridge ventilation. For skylights where there is ridge ventilation, in order to secure the proper length of the center end bar and middle side bars D D D D, as shown in Fig. 5, it is necessary to first deduct the width of the opening for the ventilator, 6 inches, and then take one-half of the balance as the curb measurement. Fig. 5 represents a skylight 4 feet wide, or 48 inches; as the width of the opening for the ventilator is 6 inches, we deduct the 6 inches from the 48, which leaves us 42 inches. One-half of 42 inches gives us 21 inches as the length to be applied to the curb measurement of the chart in determining the length of the bars D D D D. As 21 inches is not represented on the chart, we can take any two numbers that are represented and the sum total of which equals the 21 inches. But when there is not too great a fraction involved it is more convenient to take a number that will go into it an equal number of times. Twice 10½ inches is equal to 21 inches; 10½ inches curb measurement gives us 12⅛ inches on line A *e*; 12⅛ inches × 2 = 24¼ inches, the length of the side bars D D D D. To get the length of the hip bar F shown in ground plan, Fig. 5: 10½ inches curb measurement gives us on the line B *d* 16 inches; 16 inches × 2 = 32 inches, the length of the hip bar F.

As already stated, all measurements for the length of bars on this chart are at the curb line of skylight.

I am aware that all skylight makers do not use the same pitch to their skylights, some preferring one pitch and some another. I desire, therefore, to call attention to the fact that the chart can be readily adjusted to meet all of these conditions and to suit any pitch of skylight required. This is done by lengthening or shortening the lines C *e* and C *d*, Fig. 1, which represent the hight of skylight, accordingly as the pitch required is greater or less than represented on the chart. The lengthening or shortening of these lines, C *e* and C *d*, in now way affects the measuring bars on line A *e* and on line B *d*, except to increase or diminish their length.

The base line, as shown by A B, and which represents the curb measurement of the skylight, can be increased to any length desired. But for convenience in handling as a chart of reference in the workshop it is not desirable to have it too large. I consider a chart with a base line of 2 feet sufficient for all practical purposes in securing accurate measurements for the length of bars in any size skylight, as was fully shown and explained in the description above.

Test of Wire Glass.

At Newark last Tuesday an interesting test was made of wire glass by C. S. Weber & Co. of 415 Broadway, N. Y., sole agents for the American Wire Glass Mfg. Company of Tacony, Pa. In one side of a brick building 7 x 4½ feet inside and 10 feet high was inserted a window consisting of a single pane of wire glass 20 x 84 inches. In the second side was a window 28 x 84 inches and composed of three panes, supported at their meeting edges by iron bars. The third window was 34x 84 inches and composed of four panes whose meeting edges were unprotected. The roof of the building was of sheet iron having a hole in the center. In the fourth side of the building was a small door. An intensely hot fire of tar barrels was started within the structure and in a short time the glass was red hot, when a stream of water was thrown on the three windows. The glass cracked in every direction, but in no case did a piece fall out, the network of wire in the glass preventing this. Neither was there any indication of warping. The test was an unusually severe one and demonstrated that fine wire imbedded in the glass perfectly serves the purpose of holding the glass in position under the most trying circumstances and when it is broken in every part.

FLASHINGS.

The Iron Clad Roofing Company is the name under which T. O'Brien, for a long time connected with the T. New Mfg. Company, has established himself in business at 418 East Twentieth street. Mr. O'Brien makes a specialty of repairing gravel, tile and felt roofs, and is prepared to furnish estimates on all kinds of roofs.

The Globe Cornice Works are a Los Angeles, Cal., establishment, founded by I. H. Hill and J. Hetrick. During the past season they have done the sheet metal work on a number of large buildings. On one, the Bradbury Block, they used 7500 pounds of copper. They are now arranging to put in a machinery plant to manufacture ornamental stamped work.

The Pacific Metal Works will move into the new building which they are erecting for their business at 137–139 First street and 4, 6 and 8 Natoma street, San Francisco, Cal., during the month of January. The house was established by Morrow & Strong in 1876 and a branch in Portland, Ore., in 1882, and was incorporated in 1887. They make a specialty of solder, lead, tin and metals, and deal extensively in tin and terne plates, having their own special brands of roofing plates.

W. F. Berghofer has recently completed a building on Jersey street, near Fifth, Quincy, Ill., for his cornice and galvanized iron works.

The directors of the Canton Steel Roofing Company, Canton, Ohio, met January 9 for the election of officers, which resulted as follows: President, T. C. Snyder; vice-president, Ferdinand Herbruck; secretary and treasurer, Charles Schlaback, and superintendent, T. C. Belding.

At the banquet tendered the National Iron Roofing Association, Charles Aldrich, president of the American Roofing Company, was toastmaster. In that capacity his genius shone as resplendent as it does in conducting the iron roofing business. His remarks in welcoming the delegates were timely and extremely well chosen. Referring to the St. Louis banks during the recent monetary panic, he stated that not one of them suspended, not one of them failed to pay currency as called for, and not one of them issued Clearing House certificates. Referring to the proverbial conservatism of St. Louis, he said it was not that of fear and trembling, but rather the conservatism of prudence and sound common sense. His entire address was an able effort, and while the association has, perhaps, more able orators, it is doubtful if any can say as much in so few words as can the genial president of the American Roofing Company.

In an article on aluminum prepared for the 1892 volume of the "Mineral Resources of the United States," Captain Alfred E Hunt of Pittsburgh says: As yet aluminum sheet has received only a very small use for roofing, but the prospect is that there will very soon be a very large use for the metal for this purpose, when it is furnished in sheet at a rate comparable in price to copper sheet similarly used. It is well in this connection, however, to note that aluminum stands very high in the series as an electro-positive metal, and that when subjected, in contact with any of the other metals, to solutions which are at all corrosive, the galvanic action established is considerable and is, as usual, at the expense of the electro-positive metal, the aluminum. This fact has to be borne in mind in designing new uses for aluminum in connection with other metals, to avoid contacts that will establish galvanic couples.

The Capital Sheet Metal Company, Columbus, Ohio, issue circulars calling attention to Moore's Metal Ceiling, which they manufacture. The firm also make other sheet metal products, besides having a completely equipped corrugating works. On the front page is a half tone engraving of a metal panel ceiling, while the back shows a ceiling and an illustration of the patent dust proof lock joint. The various advantages of this construction are referred to in the interior pages of the circular. The method of connecting the panels is explained and the placing of the metal ceilings is said to be a simple matter. The firm send working plans in every case, showing the spacing of the furring strips and the artistic breaking of the panels. Another circular issued by the same firm calls attention to their standing seam roofing, roll and cap roofing, ridge rolls, V-crimped roofing and siding, corrugated iron, flat or curved, steel weather boards, rock faced steel siding, pressed steel brick, &c.

A copy of a Canadian work entitled "The Shipping Manufacturers' List," a guide to the manufacturers of Canada and their products, by M. J. Henry, Toronto, has been received. The work contains 560 pages, and is designed to be of service to merchants and manufacturers of Canada who are buyers of Canadian goods. A supplement of 48 pages containing the names, business and post office address of all manufacturers in the work is printed in pamphlet form, alphabetically arranged, for use of those in the United States and others who wish to address Canadian manufacturers.

Owing to too heavy shipments to Cincinnati, Pittsburgh coal is cheaper at that center than at home.

STEAM AND HOT WATER.

Ins and Outs of the Blower System.

BY WALTER B. SNOW.

The ins and outs of the blower system in their entirety would make interesting but voluminous reading. It is here intended to merely point out some of the prominent causes that operate to prevent immediate success with this system, and wherever the remedy is not thereby rendered evident, to still further point out the manner of treatment necessary to overcome the existing difficulty.

The very features of the blower system that should make it a success sometimes return, like a boomerang, to retard or prevent its successful operation. Because much is claimed for the system, much may naturally be expected; but to expect that any system can be absolute perfection, and that no matter what the capacity of the man who tends it the system shall be uniform in its action under his varying ministration, is unreasonable. But reasonable or unreasonable, there are plenty of high class buildings in which the system has been installed where its slightest failure to operate satisfactorily is made the subject of serious complaint, without thought that the fault may lie in the man who controls it; while if the same building were heated by one of the numerous furnace systems, the poor janitor or sexton would have to suffer whenever the occupants found cause to complain of discomfort.

In seeking for the cause of complaint with the blower system, investigate first the man who operates it. It goes without saying that he must be experienced. Because a man can sweep floors and shovel coal into a furnace it is no sign that he can run a boiler and a heating apparatus, consisting of motor (steam engine, electric or water motor), a fan, a steam heater and a return water apparatus. It may not call for so much higher grade of intellect, but it is imperative that the man shall know what he is doing when he is operating the system, and that he shall be able to act intelligently upon his own responsibility. In a word, that he must be capable. There is no end to the mistakes of incompetency, and some of them will appear in what follows.

The great fault lies in the fact that school, church and similar committeemen have their *protégés*, their dependents, for whom they must provide places, and qualifications in the majority of cases appear to be the last points considered.

What can be done under proper conditions is evidenced by numerous examples of thoroughly competent men operating the blower system at the same pay as men in similar positions where the furnace system is used.

The blower system is comparatively new, and few men have had actual experience with it, but any man who has run a boiler and has a fair knowledge of the machinist's trade may make himself thoroughly efficient.

When it comes to something going wrong (as is the way with everything with which we mortals have to do) he must have enough mother wit to straighten it out, and not, like one brilliant school house janitor, travel 15 miles to get some one to show him why he couldn't get any water into his boiler. Upon his return with his far sought adviser he had the pleasure of being shown that the sole, and exceedingly simple, reason of his failure was because the valve between pump and boiler was closed. What can you expect with a man of this caliber?

Insufficient Air Supply.

There exists in the minds of many men a strange conception of the medium of heat transfer with an indirect system. Heat seems to be all prominent in their minds, and its medium of conveyance is overlooked. An apartment can be maintained at a given temperature above outdoor temperature only by conveying to that room the requisite number of units of heat. Whether these are to be conveyed in steam or hot water or by means of heated air depends on the system of heating adopted. As with the indirect system, of whatever nature, the steam coils or heated surfaces are all outside the room, air becomes of necessity the medium.

The requisite amount of heat may be transmitted either by large volumes of air at comparatively low temperature or by small volumes at high temperature, but air movement and supply there must be.

Yet in face of these facts we find one of the most frequent causes of failure of the blower system to be insufficient air supply. The large areas and enormous volumes handled are not comprehended by the average attendant, and instances are all too numerous where this is shown to be true.

One man contended in the most obstinate manner that it was heat, not air, that was wanted in his dry kiln. The room in which his apparatus was placed was tight as a bottle, and he immediately entered complaint against the apparatus for insufficient capacity. Adequate air supply immediately quieted his fears.

In similar line a school house janitor was found to be very careful on a cold morning to close the windows supplying fresh air to the fan and to thereby seriously cramp the apparatus when it should work at its best. The ordinary leakage in any building is such that it is practically impossible to shut off absolutely the entire air supply, but it is possible to reduce it to such an extent as to turn success into failure.

There is, nevertheless, in the case of most buildings a time when no air should be taken from out of doors, and that is when it is unoccupied. But in place of drawing the cold air from out of doors the warm air in the building should be drawn back into the fan by opening doors throughout the building and giving free passage from the halls and corridors to the fan room.

Whenever air is taken from above the roof or from a distance, the duct or flue through which it passes must be of ample size to avoid all possible loss by friction.

It frequently happens in the case of a manufactory that when the contract is taken it is distinctly understood that for economy of fuel air is to be taken back from the building in coldest weather, at other times from out of doors. The weather gradually becomes colder. Air is still taken from out of doors, and complaint is made of inadequacy of apparatus without thought of the cause.

Insufficient Steam Supply.

The enormous condensation in the heater of a steam hot blast apparatus demands large supply pipes and plenteous supply. The condensation is, in fact, frequently so great that 1 square foot of surface in the heater condenses as much steam as can be generated by 1 square foot of heating surface in the boiler.

When, by experience, a man has learned, even roughly, of the requirements with direct radiation, he does not always at once grasp the idea that the total surface in a hot blast heater being only about one-third to one-fifth that in a direct system of equal capacity, the condensation per square foot must be three to five times as great. The arrangement of the heater somewhat influences the size of steam supply required. It is possible to so arrange and expose 100 square feet of heating surface in connection with a blower as to absolutely require an inch pipe to supply sufficient steam at 80 pounds pressure, while, with another arrangement, it will supply 300 to 400 square feet.

In buildings of the nature of school houses, churches and halls there is frequently a lack of steam pressure and supply, either through lack of draft, owing to a low chimney, or through lack of air supply to boiler, due to a tight fire room with no free admission of air for the combustion of the coal.

The low steam pressure usually carried in such buildings requires extremely large steam cylinders on the engines employed for fan propulsion, and where 30 to 40 pounds is usually maintained there is certain to be trouble when only 10 to 20 pounds is on the boilers.

Relation of Volume, Speed and Power.

One of the most startling revelations of blower experience is the rate at which power required increases with the speed. The fact is, however, that while the volume of air delivered increases directly with the speed, the pressure increases as the square of the speed and the power as the cube of the speed. For instance, if we were to double the speed of our fan we should deliver twice the volume at four times the pressure with eight times the power.

A manufacturer recently concluded that he would double the speed of his fan by taking off the engine, already direct connected to the fan, and rigging it up to belt to the fan. Nothing has been heard from him since he was informed that his engine as now running

direct connected was developing 8 horse-power, and that in order to drive the fan at twice the speed it would have to produce no less than 72 horse-power.

The Presence of Dust.

As is frequently the case, the blower system is used to great advantage in drying out a building while it is being plastered and finished. Under these conditions there is likely to be in the air drawn through the fan an enormous amount of fine dust, hardly perceptible in the air, but rendered all too evident if it gets a chance to deposit on the wall or ceiling near the opening through which it enters the room. Serious injury may result if due care is not taken. In many cases the admission of this dusty air to the fan room may be prevented by partitions or by the closing of doors. Otherwise cheese cloth or similar screens should be used.

Where dust is always present in the atmosphere permanent screens of cloth, cotton batting, moist clay balls or other approved materials are necessary to properly filter the air. Moistening devices may often be combined to advantage with the filtering arrangements.

If the air supply is taken from the roof extreme care should be exercised to see that by no means smoke from an adjacent chimney may be drawn down the air shaft. In the case of one fine building the chimney had recently to be raised some 30 feet to avoid the complete smoking out of the occupants that occurred when the smoke was blown directly across the top of the adjacent fresh air shaft.

Even the best laid plans may fail. In a beautifully appointed sanitarium the most perfect arrangements were made for the provision of pure fresh air. The ideal, as published in the circular matter of the establishment, was couched in these words: "There are in the immediate rear of the building over 30 private gardens, where grass plots and an abundance of verdure abound, and it is from these gardens, perfectly screened from the dust of the streets, that the pure air is taken and distributed through over 12 tons of galvanized iron ducts, branching like bronchial tubes into smaller ones, forming a perfect labyrinth and network of pipes. Here the pure air, after wrestling with ocean waves and battling with surf and spray, vitalized by sunbeams and scented with the breath of flowers, is borne to every apartment of the 'Palace of Health,' like gentle zephyrs freighted with healing balm." It is not in the nature of things that, even if such a paradise as this once existed, it could long continue; but one would hardly expect to find in the "Palace of Health," only a few months after its doors were opened to the public, that the beautifully tinted walls and ceilings were in many places absolutely ruined by the dust forced in by the hot blast apparatus. Around many registers on light colored walls there was a perfect halo of inky-black dust. When the parties who installed the apparatus were called in to explain the cause of this great fault on the part of their system, what was their surprise to find that, instead of the air going through its startling experience with ocean waves, surf and spray, it was being drawn directly from the boiler room, with all its dust and dirt, and that the nearest approach to the "breath of flowers" emanated from the person of the negro fireman.

Faults in Design.

Of course, glaring faults may exist in the design of the apparatus and system irrespective of the treatment they may receive. One of the most common faults lies in improper proportioning of the distributing pipe, insufficient allowance in areas being made for long runs of pipe, the pipes being made with too sharp bends, the outlets or registers improperly placed, &c. One of the most common errors of the inexperienced is to make all ducts and flues exactly as calculated. For instance, in vertical brick flue work a flue figuring out, say, 30 square inches would be made 4 x 8 inches. In point of fact, a flue figured 4 x 8 inches is likely to have a free area not more than half of this and to have such a rough interior as to cause friction far out of proportion to the exposed surface. An experienced man would make such a flue at least 8 x 8 inches, and very likely 8 x 12 inches. Always work on the principle that it is easy enough to make an opening smaller, but extremely hard and expensive to increase its size in even a slight degree.

Unless small flues can be lined or formed of tile they should be made far in excess of their calculated area. Inexperience is frequently rendered evident by fractional dimensions on round tin and galvanized iron pipe. As such pipe is regularly made in even inches, a pipe should in all cases be chosen having an area greater rather than less than that calculated.

Distribution of Air.

The manner of distribution of air from the pipe or register outlets frequently determines whether the system as introduced shall be a success or a failure. The coldest wall should always be the objective point of discharge from all outlets above head level. Frequently deflectors or diffusers greatly aid air distribution. In high shops it is always necessary that the air should reach the floor as soon as possible.

In the case of offices having low partitions and counters it is frequently impossible to heat certain portions. The trouble will be found to lie in the fact that the air, being delivered from above head level into these spaces, has no opportunity to return along the floor on account of the obstructions. The placing of openings in the partitions at floor level will usually overcome the difficulty, but it sometimes becomes necessary to carry to each apartment a separate pipe just as though it was a separate room.

Continuous Operation.

Stopping the fan is in many arrangements equivalent to shutting down the entire apparatus. But in buildings where flues lead upward almost directly from the apparatus there will often be sufficient circulation of air through the heater by natural agencies to go far toward keeping the rooms warm above. But the blower system must be considered in the same light as the direct steam or furnace systems—it must be operated continuously while the building is occupied. A properly drawn contract should specify that the apparatus must be operated continuously. A misunderstanding of this fact sometimes leads to at least disagreeable results.

In a certain hospital there was installed last fall an arrangement of the blower system guaranteed to heat the building to 70° in zero weather when operated continuously and supplied with sufficient steam. It was in use during a part of the winter as a means of drying out the plaster and keeping the rooms comfortable for the workmen. But it was shut down nights, and at times was run intermittently. Many doors and windows were continuously open, everything was damp and a greedy absorber of heat. As a very natural consequence, 70° could not be maintained throughout the building, and the system was declared inadequate. Yet the system as a whole had never been given a fair show. It was installed in a building where it was necessary to run continuously to maintain an even temperature day and night, and yet because it failed to reach that temperature during the day, after the building had been completely cooled down by stoppage over night, the system was declared a failure.

Nothing but common sense will ever clear up such matters. It was in this same building that, in order to make a test after warm weather came on, it was proposed by the architects that the contract should be considered as filled if the building could be heated to 106° with outside air at 60° instead of heating from 0° to 70°. They couldn't see that while the latter was feasible the former was impossible of accomplishment with the given apparatus (the air supply remaining constant) because the heater was not deep enough in rows of pipe to heat the air to the temperature necessary to maintain 106°.

Effect of Moisture in Ducts.

The presence of moisture in underground brick or tile ducts is a source of constant trouble which can always be avoided in the original construction—that is, so far as the moisture due to leakage into the duct from the surrounding soil is concerned. But this is not the only cause of moisture, as is evidenced by the following experience:

A certain system was found last fall, upon starting up, to cause a deposit of moisture on everything within the mill. Walls, windows and machinery were reeking. The system was condemned *in toto*, and the party who installed it was not even asked to point out the cause. On the other hand, an "expert" proved (?), to the satisfaction of the mill agent, that such a deposit was the natural result of the operation of the blower system. The party who installed the system, happening to hear of the trouble, called upon the parties and asked an opportunity to investigate. This was accorded, but with the assurance that it would do no good, as the system had proved itself a failure.

Nevertheless, the removal of a manhole cover from the underground duct was followed by the discharge of clouds of steam. Investigation then showed that a steam pipe had burst in or near this duct and steam was pouring into it. The bottom of the duct was covered with several inches of water. The cause was clear, the remedy was simple and the system was soon in successful operation.

Character of Attendants.

This brings us back to our starting point—intelligence of those who operate the system. The very apparatus in the above case showed by its filthy and unkempt appearance the character of the man who tended it, and it, after all, was not so surprising to find that so simple a cause for the difficulty should have been overlooked, in fact, unsought by him. And this, too, in a manufactory where mechanical ability and ingenuity are expected to be present at their best.

We can blame such a man more than we can criticise the ignorance of the hot blast attendant, who, with lack of oil and excess of speed, melted the Babbitt out of his engine boxes, and then related

that the first thing he knew the solder all ran out of the bearings.

There must be on the part of the attendant the simple ability to operate the apparatus and then a clear conception of the principles governing the operation of the system; how he must operate it to secure a certain result; what he must do to overcome a certain difficulty. In a word, he must know "the ins and outs" of the system.

Lily Steam and Hot Water Heaters.

Rubel & Co., 114 and 116 Lake street, Chicago, who have for several years manufactured the Lily wrought range and other specialties, have added a new department. They have brought out the Lily steam and hot water heaters. The Lily steam heater is a magazine construction, of which four sizes are built as single heaters and four sizes as twin heaters for use in heating very large buildings. Magazine feed hot water heaters are made in the same sizes as the single steam heaters, and door feed heaters in eight sizes, thus covering a very wide range of conditions and capacities. The steam heater is intended for low pressure heating, and consists of annular sections encircling the central magazine, with passages between the sections to permit the free play of the products of combustion. The hot water heater is constructed with a water chamber surrounding the fire pot into which the return pipe opens, while above the fire pot are a number of horizontal sections containing circulating plates which compel the water to flow through three chambers in each section, and thus become thoroughly heated on its upward passage to the outlet pipe. The smoke flue alternates on the right and left of each section, giving the products of combustion full play on the entire surface of each on the way to the smoke pipe. A great extent of heating surface and compactness of form are thus secured, while externally the heater presents a very handsome appearance. Automatic temperature regulators are furnished with each hot water heater.

HEATING NOTES.

Curtis & Curtis, Bridgeport, Conn., issue an illustrated catalogue and price-list of their pipe threading and cutting machinery. In an introductory address to the trade the advantages of their pipe threading and cutting machinery as compared with the old fashioned style of stock and die are presented. This is followed by a recapitulation of the principal advantages of their machines. Mention is made that these machines have been entirely remodeled. The first goods noticed are Forbes patent die stocks of various sizes and styles, running up to hand and power machines capable of cutting off or threading pipe from 2½ to 8 inches. This is followed by power pipe cutting machinery of various designs and styles, and the Curtis patent pipe threading attachment for lathes is illustrated and described. Then come a variety of smaller goods, nipple holders, die stocks, pipe vises, ratchet drills, pipe wrenches, pipe tongs and dies and nut taps. At the end of the volume is a long list of extracts from testimonial letters that have been sent by prominent concerns.

Timothy Holland of Chicago, Ill., has assigned to the Holland Radiator Mfg. Company of that city a patent for an improvement in radiators, the invention relating to a simple means for compactly connecting the separate loops.

The Nashville Machine Company, Nashville, Tenn., distribute to their friends in the trade a handsome wall calendar, at the top of which is an engraving of a famous painting by Schweninger. In the middle of the card are views of the G. & J. R. Bolton improved hot water heater, while at the bottom is the calendar.

Harvey Blank, the junior partner of the firm of Blank & Son, steam fitters, Pottsville, Pa., has decided to start in business for himself. He will locate at Minersville and will conduct the machine branch of the business.

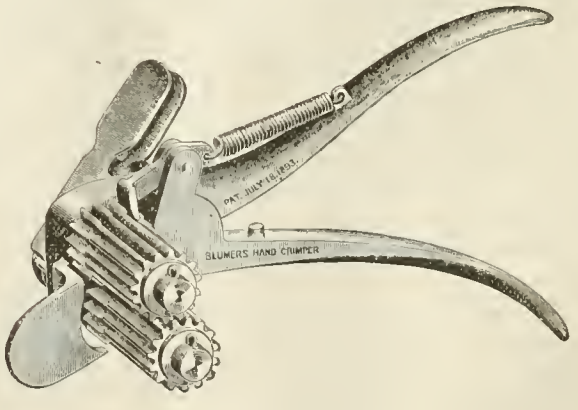
The Herendeen Mfg. Company, Geneva, N. Y., have moved their New York office to 46 Taylor Building, at 39 and 41 Cortlandt street, where the welfare of the Faultless Furman boilers in the vicinity of New York will be looked after by J. G. and A. H. Dudley, managers.

J. F. Stephenson, Lakewood, N. J., is one of the large heating contractors of his State, and has installed many successful plants for both hot air and hot water, using the Novelty furnaces and circulators.

A new shoe company at Dolgeville, N. Y., will erect a three story factory and office building, 44 x 187 feet, and it is said that the latest appliances for heating and ventilating will be supplied. The capital stock is $300,000, and Alfred Dolge, one of the directors, is the prime mover in the enterprise. W. R. Green is president and Edwin H. White secretary and treasurer.

Blumer's Hand Crimper.

Peck, Stow & Wilcox Company, 27 Chambers street, New York, are marketing the hand crimper here shown. It has been brought out largely for use by the tinner or sheet iron worker, especially when out on a job or away from the shop, where crimping in quantities is usually done with a machine. It will be found convenient for crimping leader or stove pipe. It is 7½ inches long over all, with gears ⅞ inch in diameter and 1¼ inches long. Beyond the gears is a double thumb piece with ratchet, by means of which the gears are separated so the metal can be inserted. By raising the lever to the position indicated or any one of three degrees of pressure provided for, the tool is ready to crimp. This is accomplished by pressing the handles together, revolving the gears two teeth at a time. The coil spring simply raises the upper handle after being pressed down. The gauge at the end is a part of the upper handle and perfectly rigid.



Blumer's Hand Crimper.

The Crown Index Sight Feed Oil Cup.

The Crown cup is provided with an index device for regulating the flow of oil, and an indicator arm turning on the lid to mark the notch giving the required feed. When desired the feed can be instantly turned off, and on again by replacing the index lever in the notch of the indicator arm. When the index arm is closed the lever can be left to stand up out of the notch, thus acting as an indicator to show from a distance that the feed is shut off.

The Crown Index Sight Feed Oil Cup.

Where a number of cups require different feeds, this can be accomplished with this cup without losing the original feed by simply moving the indicator arm a few notches to the right, and when the established feed is again required it is only necessary to replace the arm in the index slide which marks the required feed. These cups are made of cast brass by the Lunkenheimer Company, of Cincinnati, Ohio, in sizes holding from ⅝ to 18 ounces of oil.

There were 4132 fires in the city of New York last year, the estimated loss from which was more than $5,600,000 over and above that covered by insurance.

TIN PLATES.

Meurer Bros. Company's New Tin Plate Works.

Apparently undaunted by the chance of tariff revision, Meurer Bros. Company of Brooklyn, N. Y., are rapidly pushing the construction of their new tin plate manufacturing plant at 575–577 Flushing avenue in that city. The building which has been erected for this purpose adjoins the former premises of the firm, and is situated on a lot 50 x 95 feet in area, which it entirely covers. It is constructed on a very substantial scale, and will be entirely fire proof. The thick walls are of brick, with iron spans and girders, covered by a corrugated iron roof. The latter will be put on immediately, and skylights reaching the entire length of the shop will be fitted, giving ample light and ventilation. A floor of concrete is about to be laid down, so that there will be absolutely nothing in the structure of an inflammable nature. The shop is of unusual hight, reaching above the second story of the adjoining buildings. Foundations have been laid for six large tinning pots, to be ranged along the west side of the building. Two Phillips tinning machines are already delivered and will be installed very shortly. Four more are ordered and will be put in place as soon as received. Refining furnaces for the production of stereotype and Babbitt metal, &c., will occupy a portion of the remaining space, together with the other requisites of a tin plate plant. Ample space will be left for the insertion of additional tinning pots as requirements arise. The capacity of the works when in full operation will be about 2000 boxes weekly, and Messrs. Meurer propose embarking at once in the manufacture of a full line of both bright and roofing tin. Their standard brands of terne, which are already well known to the trade, namely Meurers' Roofing, Pullman and Flushing, will of course form the bulk of their output at first. Unless the severity of the weather or other causes interfere with the work, the firm hope to have their tin plate works in operation by the middle of February.

SCRAP.

We are indebted to the United States Iron & Tin Plate Mfg. Company, Demmler Station, Pa., for a copy of a poster table they are issuing as a New Year's souvenir. The table measures 9¼ x 12½ inches and is figured so that the user can quickly determine the price of various sizes of tin plates where the price per box of 14 x 20 is given as a basis, and where there are an equal number of sheets to a box. The first vertical column gives the number of square inches in sheets of different sizes, the second giving the dimensions of the sheets from 14 x 20 to 20 x 28. In all 43 different sizes of plates are given, including these limits. Then follows the table proper, with the prices of these 43 plates figured on a varying basis of the 14 x 20 plate. A range of prices is given varying 10 cents a box from $4.50 to $9. The use of the table is very simple. It is required to know the price of some odd size of tin plate on a basis, say, of $6.10 for a box of 14 x 20. Running along the top line until the number $6.10 is reached, descend that column until opposite the size of plate required. The intersection will give the price of the box of the odd size. An extra line also gives the price per square inch, so in case a plate is an odd size and it is not convenient to average up from the two nearest sizes, the figuring can be done on the basis of the number of square inches in the plate. Of course the table can be worked in the reverse manner. Knowing the price of an odd size plate it is easy to determine the corresponding price of a standard plate. The table is clearly printed and ruled in red. Below the table are brief references to the plates made by the United States Iron & Tin Plate Mfg. Company, also table of the weight per square foot of the different ganges of tin plates and corresponding number of United States standard gauge. The top of the poster carries a reference to the United States Iron & Tin Plate Mfg. Company, printed in patriotic style. Uncle Sam and Columbia are represented, while in the background the British lion is retreating and the Welsh goat is succumbing to the attacks of the American eagle.

The branch store which Merchant & Co. of Philadelphia established last year at 584 Flushing avenue, Brooklyn, N. Y., has proved a marked success in attracting the trade of that city and of Long Island generally. It is very favorably situated on one of the busiest business thoroughfares of Brooklyn, and the striking signs displayed on the exterior do not fail to catch the eye of the passer-by. The facilities provided for the reception and shipment of goods are excellent, and ample storage room is contained on a floor space of 80 feet square. In addition to a large stock of bright and roofing plates, sheet iron, zinc, sheet copper, metals, &c., a full line of tinners' and roofers' supplies is maintained in stock. This latter feature is said to be particularly appreciated by the local trade. Messrs. Merchant's New York manager, C. E. Bolles, has also charge of their Brooklyn branch, to the interests of which he is devoting great attention.

Evidently all the Welsh tin plate manufacturers are not discouraged by the existing depression in their trade, for we read in the English papers that four extra mills are being laid down at the Gwendraeth Tin Plate Works, Kidwelly.

With the compliments of Meurer Bros. Company, 575-577 Flushing avenue, Brooklyn, N. Y., we have received an attractive little souvenir paper weight, cast in block tin, which that well-known firm of tin plate and metal dealers are distributing to their friends. The weight takes the form of three boxes of Meurer's guaranteed brands of terne plates, carelessly piled and accurately reproducing the markings of the originals. Each box bears the name of one of their brands of roofing plates—namely, Meurer's Roofing, Flushing and Pullman, with the announcement that each sheet is stamped and squared.

Tin Plate Report to September 30, 1893.

The quarterly report on the production of tin plates in the United States for the quarter ended September 30, 1893, transmitted by Colonel Ira Ayer, special agent of the Treasury, was promulgated from the Department this week. It shows that the total product of tin and terne plates by 35 reporting firms was 27,145,480 pounds, as against 39,543,587 pounds during the previous quarter. Of this output 8,794,027 pounds were made from American rolled black sheets. In addition, the quantity of American sheet iron and steel made into articles and wares tinned or terne plated was 1,052,813 pounds; so that the total production for the quarter, subject to comparison with net imports, under Secretary Carlisle's ruling of the act, was, including the last named amount, 9,257,610 pounds. The aggregate output for the quarter from all sources was 28,198,293 pounds. Of the output of commercial plates, 13,861,317 pounds were coated with tin and 13,284,317 pounds were terne coated, as compared with 20,748,427 pounds and 19,425,336 pounds respectively in the June quarter, so that the relative proportion of each has been well maintained. Nearly 96 per cent. of the commercial plates belonged to the lighter class. The production of black plates in the United States during the September quarter was 11,355,368 pounds, against 29,988,513 pounds in the previous quarter. Of the 35 tin plate manufacturing concerns making sworn returns, 28 used American black sheets wholly or in part, and the aggregate consumption of such sheets in the various forms of tin plate manufacture was equal to 86 per cent. of the entire production. In the June quarter the proportion was 82 per cent. of the entire production.

The crop estimates of the United States for the year 1893, as just completed by the Department of Agriculture, give the following figures for some of the leading agricultural products:

	Area in acres.	Yield. Bushels.
Corn	78,938,465	1,619,496,131
Wheat	34,629,418	396,131,725
Oats	27,273,033	638,854,850
Barley	3,220,371	69,869,495
Potatoes	2,605,186	183,034,203
Tobacco	702,952	Lbs, 483,023,963
Hay	49,613,469	Tons, 65,766,158

The above figures show a falling off from the figures for 1892 in every class of crop.

The Pacific Coast has not escaped the general industrial depression. At Portland, Ore., 63 per cent. of the wage earners of the city are reported as being out of employment at the present time.

THE RETAIL STORE.

The Hardware Club and the Hardware Dinner.

As announced in our last issue, it had been determined to hold the usual dinner of the Hardware trade on the evening of February 27. Our readers will therefore be surprised to learn that the Board of Governors of the Hardware Club, at a meeting held January 12, decided without a dissenting voice to reconsider this decision and give up the dinner this year. Their action is shown in the following preamble and resolutions adopted at that meeting:

Whereas, there is at the present time much distress among the working classes as the result of the disturbance of business during the past year, and as a consequence many appeals for charity are being made; and

Whereas, it is desirable that on the occasion of the opening of the club rooms in the Postal Telegraph Building, which will soon be completed and ready for occupancy, there should be a suitable reception or banquet for the members of the club and their friends in the trade: therefore

Resolved, That the annual dinner which it was decided should be held on the evening of February 27 next be deferred or given up, and that in its stead there be, when the club comes into possession of its rooms, a suitable formal opening which will bring the members of the trade together and serve many of the purposes of the usual annual dinner.

Resolved also, That the Board of Governors recognize the earnest call which is made upon them and upon the trade at large for the relief of the existing distress among the industrial classes through the channel of individual liberality, which will in their judgment be facilitated by dispensing this year with the usual dinner, and each devoting the expense of the same to charitable purposes.

The trade generally will recognize the force of the considerations which led to the above action, which we are confident will meet their hearty approval, in view of the fact that there is much want among the working classes, not only of New York, but of other manufacturing points.

Alaska Refrigerator Trap.

The accompanying cuts represent a new zinc trap used in the refrigerators of the Alaska Refrigerator Company, Muskegon, Mich. The trap, as shown in Fig. 1, measures 2¾ inches over all, and is placed in the provision chamber just beneath the ice chamber, where it may be easily reached to remove when necessary to clean. The waste water from the melting ice is obliged to rise in the center corrugated cup above the bottom of the lower end of the upper waste pipe, shown by dotted lines in Fig. 1, before it can overflow, thus preventing outside air ascending the waste pipe. It is explained that the shape of the corrugated cup is such that the overflow will follow down the outside to its point and drop through the center of the lower waste pipe; also, that

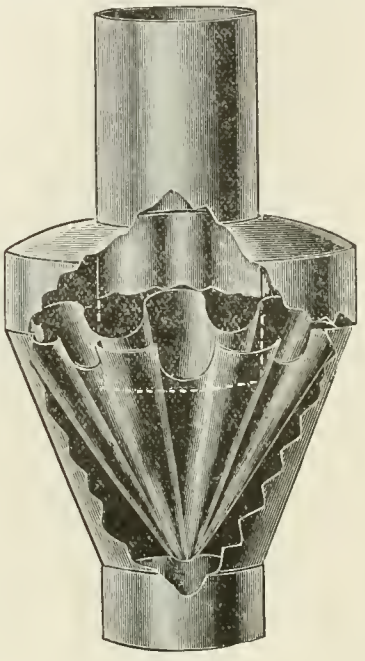


Fig. 1.—Alaska Refrigerator Trap.

the cup keeps the water away from the outside shell, so that no moisture will collect on the outside of the trap.

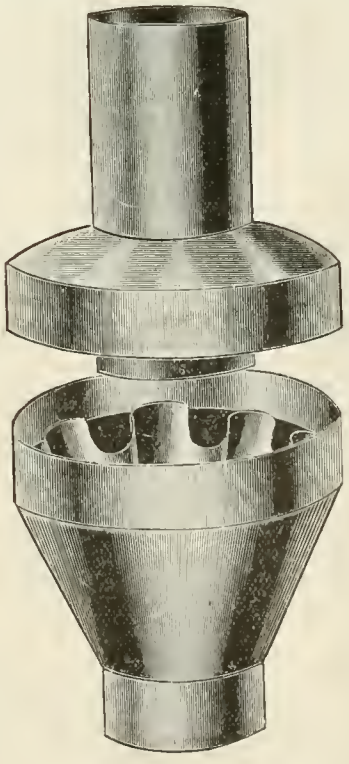

Fig. 2.—The Two Parts of Trap.

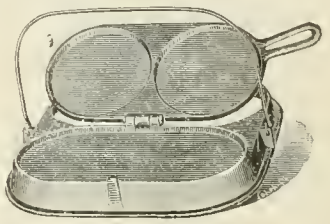
The manufacturers state that the waste pipe is made straight, and that by removing the ice rack a stick can be run through the pipe, cleaning off all deposit that may collect.

Patent Cake Griddle.

The Wagner Mfg. Company, Sidney, Ohio, have put a cake griddle on the market, as illustrated herewith. These griddles are made in two sizes, for baking four or eight cakes at once, the one shown being the four cake size, which

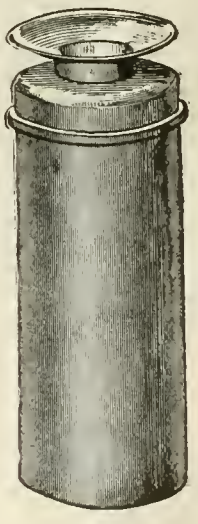


Patent Cake Griddle.

is especially adapted to gasoline stove use. Both sizes have raised bottoms allowing the heat to circulate freely and equally under all parts of the griddle. Either size may be used on any sized stove, with or without removing the lids.

The S. & P. Milk Can.

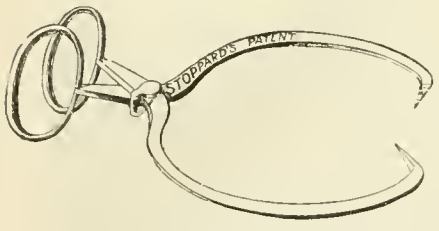
The Stuart & Peterson Company, Burlington, N. J., have just brought out the milk can shown in the accompanying cut. The can is porcelain lined and has no seams, and, it is claimed, is indestructible. It is explained that repacking is avoided by the use of the can, making a great saving in ice, and that unpleasant odors so common to tin cans are overcome. It is further explained that tin cans collect filth in the seams and that the solder causes sour milk, also liability to decomposition and poison. The can is made to contain 40 quarts, with detachable top for cleaning. It is designed for use in milk depots, hotels, restaurants, eating stands, &c.



The S. & P. Milk Can.

Safety Ice Tongs.

T. G. Ellsworth, 85 Chambers street, New York, agent for Robert Stoppard, Auburn, N. Y., is introducing Stoppard's Safety Ice Tongs, as shown herewith. The safety stop is placed upon the tongs at the point where they are riveted together, to prevent them open-



Safety Ice Tongs.

ing too far, serving as a protection to the hand of the operator and increasing the durability of the tongs, it is stated, at least one-half. The point is made that the stop does not increase the cost of the tongs. The tongs are made in four sizes : 14½, 16½, 24 and 26 inches.

The Jewel Lawn Sprinkler.

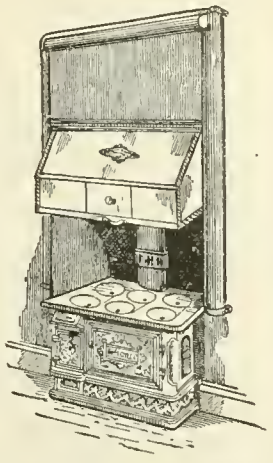
The accompanying cut shows a lawn sprinkler offered by the Detroit Sheet Metal & Brass Works, 64–72 Orleans street, Detroit, Mich. The distributing channels of the sprinkler are

The Jewel Lawn Sprinkler.

referred to as large, having no possible chance to clog up. It is stated that it will sprinkle a diameter of from 2 to 40 feet, according to the water pressure; also in a half circle. A full circle is obtained by turning the small thumb screw to the left, and a half circle by turning it to the right. Attention is directed to the carriage as being adapted to most of the sprinklers manufactured, and as being found convenient in moving the sprinkler on the lawn as desired without being obliged to shut off the water. It can be moved by the aid of the hose or of a cord attached to the carriage.

Heat and Odor Extinguisher.

The illustration herewith shows an attachment for coal and gas ranges that is being manufactured by the Heat & Odor Extinguisher Company, 525 West



Heat and Odor Extinguisher.—Fig. 1.—Open to Use Top of Stove.

Twenty-third street, New York. It is an adjustable hood with a fire proof curtain which works on a roller so that the hood can be suspended at any desired point. It forms a protection against much radiant heat, and serves as a flue to carry off both heat and the fumes of cooking, making a good kitchen ven-

Fig. 2.—Closed to Prevent Heat Escaping.

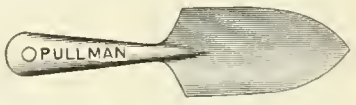
tilator. It retains the heat when down for the benefit of the cooking and protects the vessels from cool currents. The difference in the temperature in the summer from the use of the extinguisher is said to be several degrees, and enough to establish appreciable comfort. Fig. 1 shows the extinguisher raised so the top of the stove can be used, and Fig. 2 shows it closed.

Improved Freezers.

The North Bros. Mfg. Company of Philadelphia, Pa., have made what is claimed to be an important improvement in their line of Ice Cream Freezers. The improvement is to be found in the hoops of the pails of the Shepard Lightning Freezer, which they are now making, having acquired the freezer business of the Shepard Hardware Co. The hoops are made of galvanized wire, welded by electricity, and are embedded by a patented process in grooves made in the pail, thereby securely clamping the staves and making it impossible, it is claimed, for the hoops to fall off or be forcibly removed without injury to hoops or pail. Wire hoops, it is claimed, possess many advantages over the ordinary riveted flat hoops ; expansion of the wood cannot break them, and they will not stretch ; being round, only a small portion of surface is presented to the pail ; therefore, when the pail swells the hoops tend to compress the wood and cause the pail to retain its original size. The claim is also made that the electrical process of welding used in the manufacture of the hoops conduces to a better and stronger joint than is possible by any other method.

Pullman Malleable Garden Trowel.

Pullman Sash Balance Company, Rochester, N. Y., are introducing a trowel as shown herewith. It is made



Pullman Malleable Garden Trowel.

in one piece of malleable iron, thus avoiding the use of wood handles and the necessity of riveted blades. The manufacturers refer to the trowel as nicely polished, unbreakable, self sharpening and self cleaning.

MEMORANDA.

THE HAUPT STOVE & HEATING COMPANY is the name of the successors to the firm of Haupt & Becker, doing business at 619–621 West Market street, Louisville, Ky. The new firm will continue the business at the old stand and will carry a complete line of stoves, ranges, furnaces, house furnishing goods, &c. Their shop is equipped in all its different departments with the latest improved machinery and has excellent facilities for doing work on short notice.

A CIRCULAR, issued by Foster & Keach, Table Grove, Ill., illustrates and describes the Dimond Jo adjustable flue stop, which they manufacture. This stop is applicable to flues or thimbles of different diameters, and is claimed to give double protection against the smoke and fits so firmly as to prevent any accidental displacement.

IT IS STATED in the English trade journals that one result of the late coal strike in Great Britain was a largely augmented demand for oil and oil burning appliances for lighting, warming and cooking. The hardware and house furnishing goods dealers of the country who were sufficiently wide awake to foresee and provide for the demand are said to have reaped large profits. The use of oil apparatus is likely to continue for some time, as the price of coal is still very high on the other side.

One of the most powerful electric search lights yet constructed is to be mounted at Sandy Hook for coast defense purposes.

The landing agent at Ellis Island, New York, gives the number of steerage passengers landed there during last year as 364,700. In the same time 121,829 cabin passengers were landed in the port of New York by the various steamship companies.

STOVE TRADE NOTES.

The Bethany Mfg. Company

have started a new enterprise at Bethany Heights, a suburb of Lincoln, Neb. The company have a capital of $100,000 and will manufacture the Wells steel furnace and ventilating appliances, invented by George A. Wells. For six years the Wells furnaces have been successfully manufactured at Oskaloosa, Iowa, and to secure enlarged territory and to enlarge the plant came the relocation at Bethany Heights. The company now have completed, ready for machinery, on the grounds adjoining the Missouri Pacific siding at Bethany, a foundry and machine shop 61 x 157 feet in size, built in the most substantial way, brick veneered, with high basement. The cost of the building is $5500, and the machinery that will be shipped and placed in position at once will invoice in value $30,000. In addition to the manufacture of furnaces the company will be fully equipped to make castings and to do general iron work for the trade. They will employ 40 men, some 15 of whom will move from Oskaloosa with their families to Bethany Heights. They can at any time increase their working force with present capacity to 60, and can, in addition to general work, turn out annually 500 furnaces complete. The Wells furnace is adapted to either hard or soft coal, operates on the down draft principle and, it is said, makes no smoke. The incorporators of the company are J. Z. Briscoe, D. R. Dungan, W. P. Aylesworth, J. M. Borland, H. D. Hendryx, S. L. Wright, L. H. Babcock and J. G. Cordner. H. D. Hendryx is president and George A. Wells is superintendent.

The Dakota Hay and Straw Stove Company,

Webster, South Dakota, are manufacturing a cooking stove designed to use hay or straw. The stove has been specially designed for cooking, in which respect it is claimed to differ from all other hay and straw stoves which have thus far been brought out. In appearance this stove resembles the old-fashioned step cook stove, with its low hearth, four cooking holes on the next step and high oven in the rear, from which the smoke pipe ascends. A radical difference, however, is seen below the oven and cooking holes. A metal cylinder extends from the rear of the stove to the front under the hearth plate. This is intended to contain the fuel. A loose cylinder, called the feeder, is used. This is filled with hay or straw, pressed in tight with the hands. The feeder, when filled, is pushed into the stove cylinder through the rear. Cross bars on the bottom of the feeder catch on hooks on the side of the interior of the stove. The feeder is pulled out by means of a cross bar on the end of it, the fuel remains in the stove, the door is shut and the stove is ready for use, while the feeder can be charged for another filling. The fire is started from the front of the stove and is stated to produce a strong heat and as pure a flame as dry maple or hard coal. The draft is regulated by a damper. A notable feature is that a 7-inch pipe is recommended for carrying off the smoke. Bales or bundles can be used in place of the feeder. The stove is principally made of cast iron and is stated to be durable in construction.

ODD PLATES.

A PRESS DISPATCH announces that the Keeley Stove Company's works, Columbia, Pa., resumed operations in all departments on January 17.

GEORGE M. CLARK & Co. of Chicago, Ill., state that in spite of the doubt and uncertainty in the minds of buyers they have now more orders on their books for future delivery than ever before at this season. The company explain this on the ground that they believed trade could be obtained if they sought it, and the results have confirmed their belief. Their interests will be looked after the ensuing year by the following traveling salesmen, who will cover the territory named: W. C. Bissell, Chicago and vicinity, Texas and the extreme East; Edward Lange, Minnesota and North and South Dakota; J. C. Buckley, Central and Southern Illinois and Southern Wisconsin; A. F. Millikan, Northern Illinois and Iowa; George E. Harris, Michigan; C. T. Mason, Indiana; J. H. H. Clarke, Ohio, and W. J. Queeny, Missouri.

THE ART STOVE COMPANY of Detroit, Mich., have just finished the patterns for a new Franklin stove, which is said to embody many interesting features. The design is something of a departure from the usual run of goods of this class, and the manufacturers feel that the stove will be able to strongly compete in every way with anything at present on the market.

THE BRIDGE & BEACH MFG. COMPANY of St. Louis, Mo., Portland, Ore., and San Francisco, Cal., have issued a pamphlet giving a long list of testimonial letters relative to the Superior Air-Tight Oak stove. This heater has a large air tight base, capacious ash pan, drop smoke door, and the mounting is said to be done without the use of bolts or rivets, thus making repairs easy. The company state that they have hundreds of testimonials from dealers selling this stove, praising its operation and assuring the makers of largely increased sales in 1894.

AT MINNEAPOLIS, on the 10th inst., Judge Mahoney dismissed the cases of J. M. Boyd and A. R. McGilvery, charged with the embezzlement of $6000 from the Cleveland Co-operative Stove Company of Cleveland, Ohio. They were local agents for the company and were arrested on November 17 last, but the prosecution failed to develop the charge.

A. L. CANFIELD, the New York representative of the Danville Stove & Mfg. Company of Danville, Pa., has issued circulars announcing that his company have secured control of the Monarch line of gasoline stoves for the coming season. Among the superior points referred to are the lay down tanks on all junior stoves, some new lines of the junior patterns and the new process stoves and ranges which are said to be entirely new. It is also stated that the company intend to add to their line a number of new parlor stoves and ranges this year. Among the new ranges is a high grade six-hole construction, a new four-hole stove and a new low priced six-hole stove. In due season representatives of the company will visit dealers in the surrounding country in the interests of the goods named.

WILLIAM MACKEY & SONS, proprietors of the South Haven Stove Works, South Haven, Mich., closed down a short time ago for the usual inventory and repairs. It is their expectation to resume in all departments some time this month.

THE CLEVELAND FOUNDRY COMPANY, of Cleveland, Ohio, have issued a calendar for the new year in the shape of a poster bearing a large view of the Puritan lamp stove. This construction is referred to by the manufacturers as being warranted not to leak, has no seams and no joints, and the casting is in one piece. The picture of the stove is printed in colors to represent the different materials employed in its manufacture, the mica light being covered by the leaves forming the calendar proper.

THE BAXTER STOVE COMPANY of Mansfield, Ohio, have issued a very pretty little folder for the season of 1894, calling attention to the Monarch New Method gasoline stove, made in four sizes, and the Monarch Cabinet range, which is referred to as being "chief among ten thousand." The first page or cover of the folder is embellished with an embossed design in colors and bearing the inscription, "The two stars of the Monarch line." It is also announced that the Danville Stove & Mfg. Company of 284-286 Pearl street, New York, are agents for New York, New Jersey, Pennsylvania, Connecticut and Western Massachusetts.

THE UNION STOVE LINING COMPANY of Weir Village, Mass., are distributing among their friends in the trade a very pretty calendar for the new year. A striking feature of the ornamentation is a likeness of Lillian Russell, the well known queen of light opera.

THE GEM CITY STOVE WORKS, Dayton, Ohio, resumed operations last week after a brief shut down.

THE CHANNON EMERY STOVE COMPANY of Quincy, Ill., are said to have at present about 100 men at work in their various departments, and during the coming year some slight improvements in plant are contemplated.

THE FOLLOWING TRAVELING SALESMEN will represent the Bridge & Beach Mfg. Company of St. Louis, Mo., during the year: R. S. Buck in California; L. M. Dyer in Oregon and Washington; L. H. Booch in West Texas, Indian Territory and Oklahoma; J. R. Henry in East Texas, Arkansas and Louisiana;

E. H. Clayton in North Missouri; F. A. Goetz in South Missouri; B. C. Arand in Illinois; A. Weiskirch in Northern Kansas and Nebraska; R. J. Guthrie in Southern Kansas, and A. E. H. Van Sittert in Iowa.

THE VICE-PRESIDENT of the Thomas White Stove Company, Quincy, Ill., in an interview with the representative of a local paper states that the additions which the company have made during the past year in the way of new buildings and new machinery have led to an increase in the working force of 33⅓ per cent., which is certainly an encouraging showing.

THE HOWARD STOVE COMPANY of Beaver Falls, Pa., expect to resume operations with a full force about February 1. They would start earlier but have been delayed somewhat in getting out the new patterns for a range and cook stove which they will offer the trade this season. They report the outlook as fair and expect a steady run.

THE PALERMO MICA COMPANY, with office at 27 Peck Slip, New York City, have recently issued an announcement to stove manufacturers and hardware jobbers to the effect that S. T. Peckham, formerly of Utica, N. Y., has become associated with them in the mining and selling of mica, and will act hereafter in the capacity of general sales agent. The company state that they have greatly improved facilities at their mines for the careful handling of their product and that, as their business is exclusively in mica, they are enabled to give it undivided attention.

THE BRIDGEPORT STOVE WORKS is the name of the concern recently organized at Bridgeport, Ala., for the purpose of carrying on the business of stove manufacture. For the past two years E. H. & B. J. Lowman have been successfully manufacturing stoves, and demonstrated that the business may be profitably carried on in that place. In order, however, to secure sufficient capital to keep the works running full capacity, it was recently determined to form a company with a capital of $25,000. This was done, and the following Board of Directors chosen: E. H. Lowman, B. J. Lowman, T. R. Patterson, C. Douglass, R. P. Patton, Virgil Boulden and J. M. Bender. At a meeting of the Board of Directors E. H. Lowman was elected president, B. J. Lowman, vice-president, and C. Douglass, secretary and treasurer.

WE UNDERSTAND that the business of the Syracuse Stove Works, Syracuse, N. Y., for 1893, showed a decided increase over 1892, and that a satisfactory return was made to the company's stockholders.

AT A RECENT MEETING of the stockholders of the Auburn Stove Foundry Company, Auburn, Maine, H. W. Hutchins was elected president, Thomas H. Roberts, treasurer, and George C. Wing, clerk. These, with A. L. Goss, S. Record, Cyrus Greeley, Hampden Fairchild, George McFadden and J. R. Learned, constitute the Board of Directors.

THE OHIO CRUDE PETROLEUM OIL STOVE COMPANY, Ironton, Ohio, have been incorporated, with a capital stock of $200,000. The incorporators are J. D. Foster, C. A. Hammel, W. M. Kerr, H. A. Marting and Louis E Marting. W. M. Kerr is president of the company; H. A. Marting, vice president; Louis E. Marting, treasurer; J. D. Foster, secretary and general manager, and C. A. Hammel, assistant manager. The company have been organized to manufacture the oil heating and cooking stoves recently patented by Messrs. Foster and Hammel.

H. P. GINRICH, who, in connection with Wm. Straube, represents the Ringen Stove Company in Illinois, paid the home office a visit during the past week. Mr. Ginrich reports an excellent trade in Quick Meal gas and gasoline stoves, and in visiting 32 towns in Illinois during the past ten days, succeeded in booking 32 orders.

THAT there is atill some humor left in the trade, notwithstanding the present condition of business, is evidenced by the letter received by the Excelsior Mfg. Company, St. Louis, a few days since, from which we print the following extract: "During the long rest entailed upon us by anow, anti-silver and tariff legislation, we think of opening a game of 'draw,' with a 'limit' to suit the times. Enclosed find 35 cents, for which please aend us a package of your playing cards by mail. N. B.—No cold decks, please."

GEORGE W. BECK, lately traveling aalesman for Haslet, Flanagan & Co. of Philadelphia, has connected himaelf with Reeves & Horner, manufacturers of and dealers in atovea and ranges in that city, and will push the sales of their goods in Eastern Pennsylvania, New Jersey and Delaware. The genial George is well known to the trade in those aections, and we have no doubt he will build up a valuable trade for his new firm.

AMONG the concerns recently organized for the manufacture of stoves may be mentioned the White River Stove Company of Clarendon, Ark., with a capital atock of $20,000.

THE BERLIN IRON BRIDGE COMPANY of East Berlin, Conn., are putting the roof on a building for the United States Government at Fort Wadsworth, N. Y. The building is 41 feet wide and 231 feet long, the roof being made entirely of iron—iron trusses covered with corrugated iron.

AN ELABORATE contribution by A. Borsig on the influence of additions of aluminum to pig iron is printed in *Stahl und Eisen*. His investigations confirm, on the whole, the reports of Keep and others.

THE NEXT meeting of the Western Foundrymen's Association will take place on Wednesday, January 24, at 7.30 p.m., in rooms 702-703 Temple Court Building, Chicago. A paper on "The Use of Coke in Foundries" will be read by C. K. Pittman of Chicago, and it is expected that several of the more prominent coke and foundry men of the West will be present and will take part in the discussion.

E. E. BARTO is making a trip among his New Jersey friends talking the Novelty line of heating and cooking goods for the Abram Cox Stove Company, Philadelphia.

SCHWAB & SERCOMB of Milwaukee, manufacturers of the Gilt Edge hot air furnace, constructed for burning coal, wood or natural gas, have made arrangements with J. A. Carey, for the past four or five years with the Boynton Furnace Company, to represent them in the sale of Gilt Edge furnaces in the States of Iowa, Northern Missouri and Western and Central Illinois. W. N. Shandrew continues with Schwab & Sercomb for the States of Wisconsin, Northern Illinois and Indiana and Western Michigan, so that they are fully equipped to look after the trade closely in the territory designated.

AN ARTISTIC PICTORIAL CIRCULAR issued by the Michigan Stove Company calls attention to the Garland aerated ovens, as used in the construction of their cooking stoves and rangea. The arrangement is illustrated, and the manner in which it operates is very thoroughly set forth.

THE EXCELSIOR STEEL FURNACE COMPANY, 110 to 114 South Jefferson street, Chicago, have leased for a term of years the five-story and basement building at 38 and 40 West Monroe street and will take possession of the second, fourth and fifth floors as soon as the same can be made ready for occupancy and will probably move on February 1. Parts of the building are occupied by other parties, and when their leases expire this company will take possession. The lease has a contract attached thereto by which four additional stories will be added in the rear in the event of their requiring more space. The new building will be fitted up for the manufacturing and storage of furnace fittings, furnaces, boilers and other goods in that line and will have a very complete plant. The location is a good one in every respect.

THE MILWAUKEE GAS STOVE COMPANY of Milwaukee, Wis., have issued a very fine catalogue of their specialties. It comprises 34 pages of unusually excellent engravings and neat letterpress, bound in flexible black leather with the company's address embossed in gilt letters on the side. Decorated paper lines the cover and forms the fly leaf. On looking over the pages it will be seen that the company's line of Perfection gas stoves has been considerably enlarged, denoting substantial growth and increasing popularity among consumers. The special points of the stoves are enumerated as follows: Self cleaning burners, telescopic oven burners, adjustable combination needle valves, oblong ironing burners, large ovens, water back in range, dirt pans, broiler on a level with baking oven, warming oven, mechanical construction, beauty of design and interchangeable parts. The combination needle valves make each burner adaptable at once to any kind of artificial or natural gas or gas at any pressure, insuring perfect and economical combustion. Ten styles of Perfection ranges are shown, from a huge six hole 600 pound range for heavy service to three-hole 200-pound constructions for small families. Then follow hot platea with one, two and three burners, single burner portable atoves in various styles, the No. 10 water heater with a capacity of 30 gallons in 45 minutes, the No. 20 water heater with a capacity of 200 gallons per hour, gas grates in two aizes, round gas heating stoves in three sizes with polished copper reflectors and three sizes with asbestos fronts, square reflector and asbestos heaters, the Perfection boiler iron heater, laundry flat iron heater with water circulation round the burner to prevent it from becoming overheated, the Perfection gas kiln for firing china and glass, the Dresden gas kiln for firing china and glass, the Perfection melting furnace for melting metals, tinners' soldering furnace with water jacket, jeweler's enameling furnace, gas coffee roastera, gas stove supplies and gas and gasoline ovens. Telegraph code words are furnished for convenience in ordering by wire when quick shipment is desired.

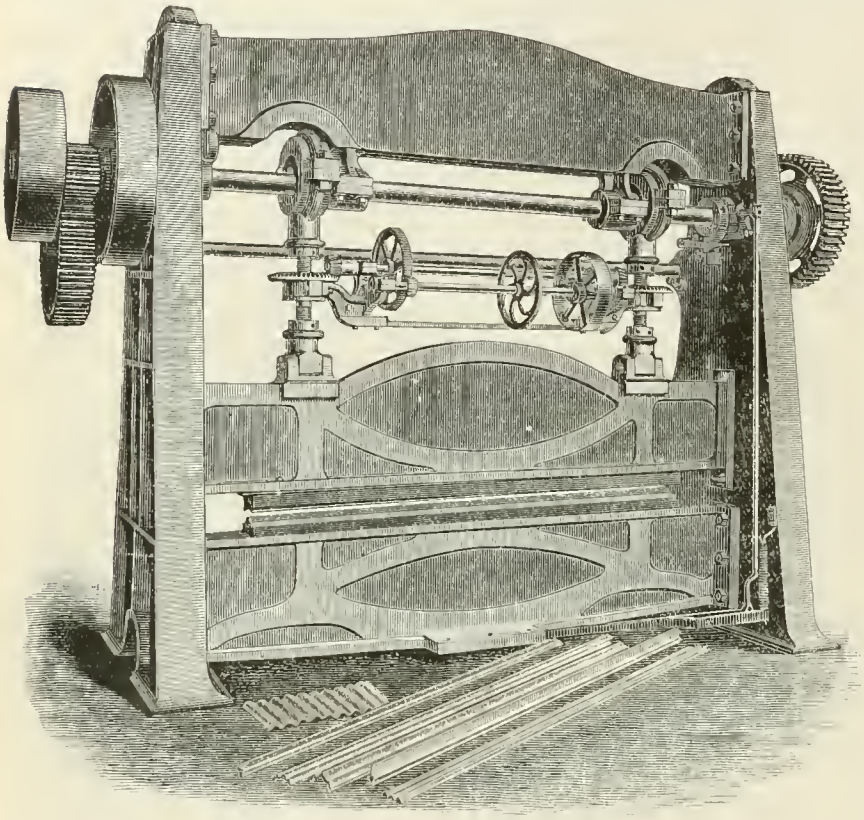
The Minnesota Stove Company, Shakopee, Minn., send out a card circular to the trade calling attention to their Premium Coral cook stove. Illustrations show the stove with and without reservoir, and both styles are made in four sizes, with ovens measuring from 20 x 22 to 22 x 24 inches. It is made with outside nickel shelf, cemented oven tops, patent door opener and nickel panels with tile center piece.

We have received, with the compliments of Henry Gleason, manufacturers' agent, 106 Beekman street, New York, a very tasteful and artistic calendar for 1894. It is in the form of a fan, composed of a bunch of maple leaves in all their gorgeous autumn tinting. The handle is gilt and adorned with a pink satin bow. To it is attached by white silk cords a miniature "art gem" calendar, each leaf of which bears an apt Shakespearean quotation. A card on the box containing the souvenir sets forth that Mr. Gleason is agent for the Trent Tile Company, the Matthews Mfg. Company and the New Jersey Lamp & Bronze Works. Inclosed in the box was a circular issued from the office of the Matthews Mfg. Company, Worcester, Mass., informing the trade that the company are making and selling stove knobs under certain U. S. patents which they own. The company announce that they find themselves in better condition to cater to their wants than ever before.

At the annual meeting of the Schuylkill Valley Stove Company, held at Spring City, Pa., on January 16, the following directors were elected: C. C. Armpriester, L. L. Esenhouer, Montgomery Frick, John W. Gephart, J. H. Richard and Andrew McMichael. At a meeting of the board C. C. Armpriester was chosen president; L. L. Esenhouer, vice-president; Montgomery Frick, treasurer, and John W. Gephart, secretary.

On Thursday of this week the Buck's Stove & Range Company resumed operations with a force of 350 hands. According to press dispatches from St. Louis, a notice was sent out on Monday, the 15th inst., ordering all the employees to report for work on Thursday, January 18. It stated that there would be no reduction in wages, and that the move was made for the purpose of giving midwinter employment to the deserving.

The Old Water Mill.—J. Wood & Bros. Company of Conshohocken, Pa., have published a highly interesting picture of their "Old Water Mill," which probably was the first to manufacture light sheet iron in America. Erected in 1831 by James Wood, it has continued in operation ever since—for 63 years—under direction of himself and direct descendants. While a considerable part of the old machinery yet remains, it was never equal to so much work as it is to-day. The tonnage of the old mill at the start and for some years afterward was only about 300 tons of No. 24 to No. 28 per annum. Now the production is from 2200 to 2400 tons. By reference to their old books J. Wood & Bros. Company find that during its early days the product of the mill sold at $160 to $170 per ton, when it is selling now at one-third of that figure, if not less. Although the old mill has not known what it was to stop night or day since 1831, it is pronounced as able now to hold its own against all competitors as it was when it practically had none to contend against.



Sheet Metal Press.—Fig. 1.—General View of Press.

Sheet Metal Press.

George A. Ohl & Co., Newark, N. J., are offering to the cornice and sheet metal trade a press, illustrated in Fig. 1. The machine, which weighs 20,000 pounds, has been designed especially to make use of dies, so as to make several bends at once, such as skylight bars, ceiling corners, eave troughs, corrugations, &c. Some of the dies and shapes formed by them are illustrated in Fig. 2. We understand that in this machine skylight bars, seven bends at a time of No. 24 iron, 8 feet long, have been made, while sheets of No. 14 iron have been corrugated in half a minute. The machine is so constructed that there is no springing of its different parts, thus securing, it is claimed, straight work and also great durability of the machine. It is arranged to be adjusted readily to the different shapes of dies and thicknesses of metal. The press is geared 1 to 20 and provided with an automatic clutch, enabling the operator to stop at any time.

Next Tuesday night an entertainment, consisting of reading, declamations, &c., will be given to the pupils of the day and evening classes in the lecture room of the New York Trade School, 1260 First avenue, New York.

A dispatch from Hartford, Conn., reports that throughout Central Connecticut there are evidences of a marked revival in the industrial situation—not a rapid movement, but a steady one. Hartford itself has suffered comparatively little from the late depression.

Of the 1500 men employed out of the relief fund on work in the park at Pittsburgh over one-half are native Americans.

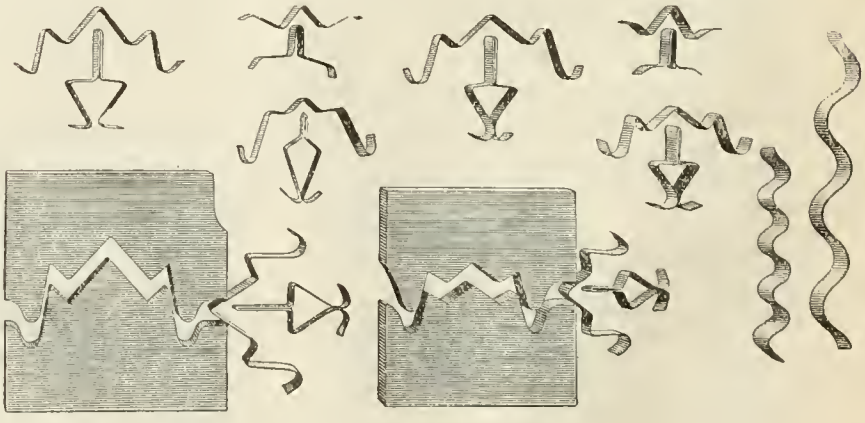


Fig. 2.—Examples of Work.

TRADE REPORT.

The Iron Market.

There are unmistakable signs, faint though they may be, of improvement in the Iron trade. There is more inquiry and more business is being done, though it must be confessed that in the majority of cases it is at the sacrifice of values. Still, every one understands that no hardening of prices can come until we begin to approach normal consumption.

We are far from that yet, but there is some encouragement in noting that the demand is growing. It may be true that this is delusive, because orders deferred in December are now being given out. We are inclined to believe that many consumers have reached the point when they must replenish stocks. As is natural, this crops up first among those staples which are distributed in the smallest quantities to the largest number of buyers. Thus the whole range of the Wire trade is reported as experiencing a very large demand for this season of the year.

We believe that the trade is concentrating its attention altogether too much upon the terrible condition of prices and is not watching closely enough the volume of the demand.

Some pretty good contracts for Cast Iron Pipe have been given out in the last four weeks in different parts of the country. The Standard Gas Light Company bought upward of 5000 tons. Brockton and Boston are in the market for like quantities, and several Northwestern cities have p'aced moderate orders. Prices, however, have been very low.

An order for 3½ miles of 8-inch Wrought Pipe has produced a record breaking price in Pittsburgh.

Pig Iron.—The New York market is quiet, although a somewhat better inquiry is noted. As yet the leading makers of Eastern Pennsylvania brands have not met the price made by the Lowmoor Company, although good Virginia Irons have sold for a considerable time below the prices named. It is understood the Lowmoor Company have not placed much Iron for immediate delivery, but that they have placed quite considerable contracts for the near future. We quote standard brands, $13 @ $14 for No. 1; $12.50 @ $13 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $13.50 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12 for No. 3; $11 50 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

Philadelphia advices intimate that the Pig Iron market in that district maintains its condition of dullness. There is more Iron offering, and although prices are nominally unchanged, it only needs the right kind of a bid to secure more or less of a reduction. Large consumers are not in the market to any extent, and for the time being buyers and sellers alike are touching the market carefully. Conditions are on the whole less favorable to the seller than has yet been the case, although there is a chance that the current demand may enable holders to maintain their position. General asking quotations for seaboard deliveries are about as follows:

No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

In Chicago very little business has transpired in Southern Iron and prices appear to be somewhat weaker, current quotations having been shaded on some sales of small lots. Business in local Coke has not improved in accordance with the increased inquiry reported last week. Outside of a 1000-ton sale transactions have been confined to small lots. Travelers through the Northwest report prospects unfavorable to much business in the near future from that section. This does not arise from lack of confidence among foundrymen, or the hope that prices will be lower, but really on account of the limited amount of work which is now obtainable. There is some expectation, however, that business will improve in that section as spring approaches. Lake Superior Charcoal is still neglected. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.30 @ $15.50
Local Coke Foundry, No. 1	13.00 @ 13.50
Local Coke Foundry, No. 2	12.50 @ 12.75
Local Coke Foundry, No. 3	12.00 @ 12.50
Local Scotch	13.50 @ 14.00
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	..... @ 13.75
Southern Silvery, No. 2	..... @ 13.25
Southern Coke, No. 2	11.90 @ 12.15
Southern Coke, No. 3	11.40 @ 11.65
Southern, No. 1, Soft	11.90 @ 12.15
Southern, No. 2, Soft	11.40 @ 11.65
Tennessee Charcoal, No. 1	16.00 @ 16.50
Tennessee Charcoal, No. 2	..... @ 15.00
Alabama Car Wheel	18.00 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

While no actual increase in the demand for Pig Iron has been noted in the Pittsburgh market, there are symptoms there which lead to the belief that the situation will not get any worse, but may soon show improvement. Buyers have not as yet shown any inclination to purchase very far ahead. However, we are advised that in a few cases where buyers have contracts running for two or three months ahead they have notified the seller that they will be able to take the Iron out a little ahead of time. This is indicative of an increased consumption in certain sections, which may become general before long. Quotations are given as follows:

No. 1 Foundry	$11.75 @ $12.00
No. 2 Foundry	11.25 @ 11.50

While there has been some little increase in the demand for Pig Iron during the past week in Southern markets, it was not large enough to be significant. There was some buying by the Iron Pipe Works in the South, but not to any large extent, the largest sale being 2000 tons for delivery running through four months, and the jobbing foundries appear to be doing a little more business. The tone of the market is decidedly weak, and if there was any disposition to buy largely it is apparent that a concession of at least 25¢ ₱ ton could be secured on most if not all grades of Foundry Iron. There have been some small sales of Charcoal Iron, but nothing has transpired to indicate any essential change in the market. Quotations are as follows:

Southern Coke, No. 1	$11.75 @ $12.00
Southern Coke, No. 2	10.75 @ 11.00
Southern Coke, No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—Slow trade and lower prices stand as the prominent features of the market for the week under review. There has been hardly any speculative movement here and very little tendency in that direction. Trade and consumptive demand have continued to be comparatively light, and for the most part at a slightly lower level of prices. The dullness of trade here, along with the further depreciation in London values, has caused prices to droop still further, leaving a net loss for the week of about 0.10¢. Ten-ton lots have been sold at 20.10¢ @ 20 15¢, to a moderate extent, and jobbing parcels at corresponding prices. At this writing bids above 20¢ net cash for round lots are few and far between. Jobbers' prices for small lots are quoted at 21½¢ @ 22¢. Straits shipments during the first half of January were 675 tons Great Britain and America and 250 tons to the Continent, against a total of 1750 tons in the corresponding period last year.

Copper.—Warnings of something in the nature of a real break in prices were sounded on the Metal Exchange on

Tuesday, when Lake Superior Ingot was offered at 10¢ for delivery from February to May, inclusive, and at 9¾¢ for June and July delivery. Representatives of the leading producers intimated that those prices were purely speculative and no reflex of true market value. but, whatever the facts in this connection, it was demonstrated beyond all question of doubt that sales of Lake Ingot have been made at 10¢ regular terms to the amount, it is said, of at least 250,000 pounds. Electrolytic Copper is quoted at 9¾¢, common Casting stock at 9¼¢ @ 9½¢, according to brand and quantity. The consumptive demand is said by dealers to be very languid, yet prices for small lots remain—at least nominally—at the former level, namely, 11¢ ℔ lb for Lake Ingot.

Sheet Copper.—No improvement has as yet developed in the market for Sheet Copper, although hopes are entertained of a revival of demand when some of the building operations now under consideration are actually started, which may not be until early summer. Stocks in jobbers' and consumers' hands everywhere are believed to be very attenuated, so that a good business is anticipated when these conditions are fulfilled.

Pig Lead.—Prices have remained almost stationary and business has been exceedingly slow. It is asserted that 2500 tons or more are in store here or held by local merchants; that the principal consumers are carrying more surplus stock than usual, and that a considerable accumulation has taken place at Western points during the past month or six weeks. In short, the statistical position would appear to be unfavorable and the market suffered from the fact that considerable quantities of Lead remain in the hands of operators, who bought more or less freely at from 3¾¢ down to 3½¢ on the theory that Lead was very cheap at those prices. Unfortunately, theory and fact failed to harmonize, and at 3.20¢, the current quotation, probably the entire holdings could be duplicated. Prices for small lots from store are still down to 3¾¢ @ 4¢, with ample stocks on hand.

Lead Pipe and Sheets.—Business in these products continues very tame, with no immediate prospect of any material improvement. Local manufacturers have reduced their list price for Lead Pipe and Sheet Lead ½¢ ℔ lb, as detailed in another column.

Spelter.—The position of the market is practically the same as it was at the date of last market report. On the theory that prices are phenomenally low, most holders seem inclined to stand out for better prices, but the weight of facts causes others to make the most of a poor position, and the result is that not only common Western but brands that run somewhat above the average in quality have been sold at 3.55¢ in single carload lots for prompt and near future shipment. Business in inferior brands has been effected at as low as 3.50¢, prompt shipment from the West, while 4¼¢ is asked for smaller jobbing quantities, for which there is no more than a fair demand.

Antimony.—Dealings have been of a perfunctory character and moderate all told. Prices for small lots remain quite steady at 10¼¢ @ 10½¢ for Hallett's and 10¾¢ @ 11¢ for Cookson's,

Tin Plate.—The probable recovery in the demand for Tin Plates which was looked for after the second week of the new year has failed to materialize during the past week, although some fairly good business was effected in the early part of the week in Coke Plates of special sizes for near future delivery. The prices obtained were, however, invariably low, being, on the average, about 5¢ @ 7½¢ below those current for spot goods. In general, the business that is passing continues confined to the narrow proportions which have characterized the trade for so many months—namely, nothing beyond the satisfying of absolute wants. The demand is much behind the average for this season of the year, nor is it at all likely to expand until something definite is known as to the fate of the Wilson Tariff bill as it affects tin plates. When this is settled the conditions will be favorable for a very good if not a rushing demand, to meet which may tax the resources of importers and manufacturers, stocks being now remarkably light both at the seaboard and in the interior. The line in which the most constant business seems to be maintained is in domestic Terne Plates, for which a very fair current demand exists, although stocks of these plates at the works and in jobbers' hands are at present amply sufficient to meet all the calls upon them. Prices on spot goods are somewhat irregular, with the tendency in buyers' favor.

A cable dispatch of January 17 from London to *The Iron Age* reports the British Tin Plate market as weak, with easier prices and reduced inquiry. Liverpool prices are quoted as follows:

IC Charcoal, Alloway grade.....12/3 @ 12/9
IC Bessemer Steel, Coke finish. .. 11/ @ ....
IC Siemens " " " .....11/3 @ ....
IC Coke, B. V. grade, 14 x 20.....11/ @ ....
Charcoal Terne, Dean grade.....10/6 @ ....

We are in receipt of a letter from the Cowles Electric Smelting & Aluminum Company, Lockport, N. Y., denying the report that has recently been printed that they had consolidated with the Pittsburgh Reduction Company. They say that the two companies are not consolidated, nor are there any negotiations to that effect pending, neither are they expecting to move their plant to Niagara Falls. Their works at Lockport are still in operation and they are prepared to furnish aluminum and their different alloys as heretofore.

Fire damaged the Turner Bros'. Works, 109-111 North Water street, Chicago, to the reputed extent of $6,000, on January 15.

Chicago Report.

Scrap.—Iron and Steel are lower than ever, on account of the increasing supply and the light consumption. Dealers furnish the following revised list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.50	...
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	7.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3⅛¢
Pipe Lead	....	2⅛¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—Dealers report no improvement. The weather has been springlike for the past fortnight. Concessions from regular rates fail to stimulate the demand. Carload lots of 12 net tons or over are still nominally quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

An unusually serviceable trade souvenir is issued with the compliments of the Star Baker Company of Belleville, Ohio, in the interests of the Columbia Roaster and Baker, which they manufacture. The advertisement in the souvenir is confined entirely to the modest announcement on the cover. The book, measuring 5½ x 2 inches in size, is "Thompson's Pocket Speller," and contains over 100 pages of double columns, giving all the ordinary words that would be employed in correspondence. Reference to the words is made very easy by means of a ledger index along the side of the pages. In addition to the regular dictionary there is given at the end a list of words pronounced alike or nearly so, but spelled differently. This is followed by a list of names of men and women, rules for the use of capitals and punctuation, abbreviations, &c. A valuable feature is the list of forms for notes, bills and receipts. On the inside of the back cover is an erasable page for memoranda.

CONDITION OF THE

Hardware Trade.

THERE IS a perceptible increase in the volume of business, orders beginning to come in from the travelers who are in the field. There are many, however, who have not yet started out and many more from whom there has not yet been time to hear. Manufacturers and the large trade report many inquiries in regard to quotations and terms on considerable parcels of goods, indicating that the trade throughout the country are making careful preparations for the season's business. There is little to report in the way of prices, quotations being, as a rule, on substantially the same level as for some time past. There seems to be, however, a somewhat better feeling in some staple goods, and some well informed parties express the hope that the bottom has been touched and that the reaction must soon come, or at least that present prices will be maintained. On the other hand, the tone of the market in general Shelf Hardware is not especially strong. Some irregularities have been developed in lines on which prices have hitherto been pretty steadily maintained. An important feature of the situation also is the fact that there is a disposition among manufacturers to reduce wages, and in many lines reductions ranging from 10 to 33⅓ per cent. have been made. This influence, with the low prices ruling on raw material will naturally have the effect of reducing ultimately the price of the manufactured articles. The trade, recognizing this fact, are naturally indisposed to purchase beyond their early requirements, but with the better feeling prevailing in business circles are making their preparations for a fair season's trade. The fact that both manufacturers and merchants have unusually light stocks is an important factor in the situation, and many well informed Hardwaremen think that if business attains even a fair volume, the prices of some lines of goods may be strengthened on this account.

Advices from Chicago.—Jobbers note, as a peculiar feature of this season's trade, that while business for immediate shipment is smaller than usual their orders for future delivery are unusually large. A big movement is promised in Refrigerators, Wire Cloth, Poultry Netting, Screen Doors and Windows, Ice Cream Freezers, steel goods, &c. Shelf goods are nevertheless gaining in volume of business and the outlook grows more encouraging. It is generally believed that if the tariff question was to be settled decisively trade would become very active, as all stocks are light from manufacturers to dealers and consumers. Business in heavy Hardware is not so good as it has been and considerable complaint is heard of the falling off of business among the smaller manufacturers who are the customers of jobbers.

Notes on Prices.

Wire Nails.—While the demand for Wire Nails has not set in in heavy volume there are decided indications of an improvement, and it is evident that the trade are disposed to supply their wants in the near future. A good many small orders are being received and the manufacturers have many inquiries from the jobbing trade and also from retail houses, which lead them to expect a fair volume of business before long. Prices are steadily maintained at former figures, the market being represented by the quotation of $1.10 for carload lots at mill, with a concession of 5 cents on large orders. The mills are increasing their production and getting in shape for the anticipated trade, the year having opened with exceptionally small stocks on hand.

Advices from Chicago.—The opinion gains ground that Wire Nails have turned the corner and that the lowest price for the present has been made. There is a constantly improving demand and sales are running along quite satisfactorily. The factory price appears to be gradually settling at $1.20, Chicago, on the usual terms. Jobbers are selling at $1 25 to $1.30 from stock and report a very active inquiry from dealers for carload lots. This is reducing jobbers' stocks rapidly and is expected to help their prices.

Cut Nails.—The Cut Nail market, without having developed any special activity, seems to be in a somewhat better condition, and prices are slightly firmer. They are still represented by the quotation of 90 cents in carload lots at mill, but some of the manufacturers refuse to make this figure. Small lots from store in New York are held at $1.20 to $1.25.

Advices from Chicago.—Trade in Cut Nails is growing heavier. Orders are not only larger, but specifications are coming in more freely than for several weeks past. The increased trade from districts hitherto occupied exclusively by Wire Nails continues to be a source of encouragement to the Cut Nail manufacturers. They are advised by jobbers that the demand for mixed carloads of Wire and Cut Nails is again a feature of the trade. Quotations on factory lots continue to be $1.15 to $1.20, Chicago, with concessions for high averages. Jobbers are quoting $1.25 from stock.

Barb Wire.—The Barb Wire market is characterized by the same general features as for the past few weeks, there being no important change in price and no marked increase in the demand. Some of the manufacturers, however, while referring to the unprofitably low figures which are prevailing, express the conviction that the volume of trade during the next few months will be exceptionally heavy, there being indications of a large demand from several sections of the country. There is a good deal of unevenness in the prices made by the different manufacturers, some of whom are selling Galvanized Four Point at $2.05 at mill, with 5 cents off in carload lots. Other manufacturers are refusing to meet this figure and are obtaining a considerably higher price.

Advices from Chicago.—Considerably more business is doing in Barb Wire. Contracts are now being made for the replenishment of jobbers' stocks, as they find a better demand from retailers throughout the West and Northwest. The market, however, is a little lower in consequence of the efforts of manufacturers further East to secure business in this territory. Carload lots are therefore quotable at $2.20 to $2.25 for Galvanized, while small lots from stock are selling at $2.30 to $2.40.

Poultry Netting.—The market in Poultry Netting is characterized by animated competition among the manufacturers, and as a result exceptionally low prices have been developed.

Hinge Cover Square Can.—The Record Hinge Cover Square Boxed Can, manufactured by Record Mfg. Company, Conneaut, Ohio, and illustrated in our issue of December 30, 1893, is sold at the following list, subject to a discount of 50 per cent. :

	Each.
1 gallon can	$0.50
5 " "	1.00

Hat and Coat Rack.—The Derby Hat and Coat Rack, for which the American News Company, 37 to 41 Chambers street, New York, are agents, are sold at $2 per dozen, 30 days net, alike for all sizes.

Glass.—The question as to whether all Glass factories will shut down February 10 is an interesting one to all engaged in the Glass trade. At a meeting of manufacturers held last week in Pittsburgh this action was unanimously adopted, although but a limited number of manufacturers were present at the meeting. The action of the meeting, it is stated, is not to be binding upon the individual manufacturer unless 85 or 90 per cent. of the pots available for operation can be induced to unite in the movement; and this is considered doubtful. Stocks of Glass in manufacturers' hands are small, and those whose factories are running have no trouble in supplying the demand. Pittsburgh reports quote 85 and 10 and 5 per cent. discount for single, and 85 and 20 per cent. discount for double strength, as the lowest prices being made from factory. A New Jersey manufacturer refused an offer of 85 and 7½ per cent. discount for a carload of single strength Glass, but accepted the order at 85 and 5 per cent. discount. It is reported that a Western firm recently quoted Glass at 85 and 20 per cent. discount, f.o.b. Baltimore. The foregoing represents the variation in prices in different parts of the country. In Plate Glass circles it is understood that

a quiet understanding is in operation among three or four of the larger Pittsburgh firms, which has had the effect of checking the downward tendency of prices to some extent.

Lead Pipe and Sheet Lead.—Colwell Lead Company, 63 Centre street, New York, issued on January 18 a new price-list of Manufactured Lead, subject to market changes without notice, on the following basis:

Lead Pipe	5¾¢ ℔ lb
Sheet Lead	6½¢ ℔ lb
Block Tin Pipe	37½¢ ℔ lb
Tin Lined Pipe	15 ¢ ℔ lb

The usual charges will be made for packing and cartage. Packages returned in good order, freight paid, credited at cost. Old Lead in exchange 2¾¢ ℔ lb

Old Metals.—The demand for Old Metals is of the same languid, uncertain character previously mentioned. Prices are fairly steady, although still very low. Some fair sales of small lots of Scrap Iron have been noted, but nothing is done on a large scale, nor is there any present sign of an increased demand in the near future. The following quotations represent generally the prices paid by New York dealers for moderate quantities of Old Metals:

Heavy Copper	℔ lb 7¢
Light and Tinned Copper	℔ lb 6½¢
Heavy Brass	℔ lb 5¢
Light Brass	℔ lb 4½¢
Lead	℔ lb 3¢
Tea Lead	℔ lb 2¾¢
Zinc	℔ lb 2½¢
No. 1 Pewter	℔ lb 14¢
No. 2 Pewter	℔ lb 6¢
Wrought Scrap Iron, ℔ gross ton	$7.00 @ $8.00
Heavy Cast Scrap, ℔ gross ton	8.00 @ 9.00
Stove Plate Scrap, ℔ gross ton	4.00 @ 5.00
Burnt Iron, ℔ gross ton	2.50 @ 3.00

Old Paper, Rags, &c.—No improvement has yet developed in this market, and the tendency of prices is to decline. Quotations for New York delivery are about as follows:

No. 1 White Rags	℔ lb 3¼ @ 3½¢
No. 2 White Rags	℔ lb 2¼ @ 2⅝¢
Mixed Rags	℔ lb ¾¢
Blues and 3ds	℔ lb 1 @ 1¼¢
Hard Sized White Shavings	℔ lb 2¼ @ 2⅝¢
No. 1 White Book Shavings	℔ lb 2 @ 2⅛¢
No. 2 White Book Shavings	℔ lb 1 @ 1⅜¢
Light Book Shavings	℔ lb ¾¢
No. 1 Mixed Shavings	℔ lb ¾ @ 1 ¢
No. 2 Mixed Shavings	℔ lb ½ @ ¾¢
No. 1 Printed Books	℔ lb 1 @ 1¼¢
Ordinary Mixed Books	℔ lb ½ @ ¾¢
Newspapers	℔ lb 2-5 @ ½¢
No. 1 Manila Paper	℔ lb 1 @ 1⅛¢
No. 2 Manila Paper	℔ lb ⅝ @ ¾¢
Bogus Paper	℔ lb ½¢
Common Paper	℔ lb ⅜¢
Straw Chips	℔ lb ½¢
Binders' Clippings	℔ lb ½ @ ⅝¢
Jute Butts	℔ lb 1⅞ @ 2 ¢
No. 1 Jute Bagging	℔ lb 1 @ 1¼¢
Mixed Bagging	℔ lb ¾ @ 1 ¢
No. 2 Bagging	℔ lb ½ @ ¾¢
Hemp Twine	℔ lb 2 @ 2¼¢
Manila Rope	℔ lb 2¼ @ 2⅝¢
Jute Rope	℔ lb 1½ @ 1¾¢
Mixed Rope	℔ lb ¾ @ ⅞¢

Old Rubber.—Market narrow and prices irregular. The following quotations are those nominally ruling for Old Rubber delivered in this city:

Car Springs, ton lots, ℔ lb	@ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb	@ .03
Rubber shoes, less than carloads, ℔ lb	0.02¼ @ .03⅛
Large Hose, ℔ ton	@ 9.00
White Wringer Rolls, ℔ lb	@ .04¼
White Syringes, ℔ lb	@ .05

Trade Notes.

At Valparaiso, Ind., on the 11th inst. the sale of the Vienna Enamel & Stamping Works to A. J. Johnson of Chicago was confirmed by the court. Mr. Johnson bid in the plant for Gustav Wilkes of Chicago, who expects to start up about March 1. The property cost over $100,000.

A company to manufacture gas and electric light fittings in New York City has been incorporated with the Secretary of State at Albany under the name of the Black & Boyd Mfg. Company The directors of the concern are John A. Black, W. P. Brice. L. Plaut and Herman Plaut of New York City. Capital, $25,000.

The Simpson-Fry Mfg. Company were incorporated on January 16 to manufacture metallic goods in Brooklyn, N. Y., with a capital of $12,000. The directors are J. C. Fry, J. C. Fry, Jr., and J. S. Simpson of Brooklyn.

The Cleveland Steel Company, Cleveland, Ohio, have purchased the entire plant of the Britton Iron & Steel Company, Cleveland, who were manufacturers of bright and galvanized sheet iron and steel. The Britton plant has been closed entirely for the purpose of remodeling and the latest improved methods for the manufacture of Sheet Steel in all its branches will be introduced. The Cleveland Steel Company are also erecting a steel melting department in connection with the works for the manufacture of the highest grades of steel.

The Scottdale Iron Steel Company, Limited, Scottdale, Pa., manufacturers of iron and steel sheets, are adding two new sheet mills to their equipment and buildings to cover same. The addition of these two new mills requires the erection of two additional sheet heating, two bar heating and one annealing furnace, which are now under construction. This firm are also putting in one of Warren Webster & Co.'s feed water heaters and purifiers of 1500 horse power. The excavating has been completed and the materials are now on the ground for the foundations. New foundations are also being put in under the large sheet mill engine and fly pit wheels, and a new wrought iron shaft is being added to one of the fly wheels, to replace an old one. Other necessary repairs are also being made.

Investigation proves that there are good grounds for the report that sheet mills will be built at Canton, Ohio. The active people in the enterprise are a number of former employees of Kirkpatrick & Co., Leechburg, Pa., who were recently locked out. An organization has been formed and arrangements made with the Canton Board of Trade to locate at that point. E. L. Burchfield is secretary of the new company. It is expected that contracts will be placed about the 20th of this month. The fact that the iron and steel roofing concerns consume annually about 7000 tons of black and galvanized light sheets was an important factor in deciding the location. The new plant will consist of two sheet mills and a sheet bar mill and will cost when completed about $50,000.

The sheet mill plant of the Ellwood Steel Company, Ellwood, Pa., was sold last week at assignee's sale for $33,500, the purchase being made by A. W. Brown, vice-president and general manager Cambridge Iron & Steel Company, Cambridge, Ohio, acting in the interests of the stockholders. These works consist of four sheet mills without sheet bar mill. The buildings are made of steel and every part of the machinery is new. Wm. Tod & Co., Youngstown, Ohio, furnished the engine, which is geared to run two trains of rolls, one from each side. The roll trains were furnished by the Leechburg Foundry & Machine Company, Leechburg, Pa. The plant is equipped throughout with every modern convenience, annealing furnaces of recent design and all necessary facilities. It is stated that operations will commence in a few weeks.

The W. F. Washburn Brass & Iron Works, Yonkers, N. Y., which closed down last month when the firm made an assignment, will, it is announced, start up again in a few days to fill orders in hand. The works employ about 250 men.

A press dispatch from Easton, Pa., reports that the American Sheet Mill, at Phillipsburg, N. J., employing 100 hands, will resume operations on February 1.

It Is Reported—

That the Hardware store of A. J. Stewart & Co., Sullivan, Ind., was burglarized on the 4th inst.

That T. T. Smith has sold out his Hardware store at Nebo, Ill., to Alves Hayes.

That Charles Meddaugh has recently entered the Hardware business at Garner, Iowa.

That H. B. Sultelgte has purchased the Hardware stock of H. H. Parrish, Archer, Iowa.

That the style of the Implement firm of R. W. Coates & Co., Bloomington, Ill., will on March 1 be changed to M. A. Coates & Co. The firm have been in business about 15 years. R. W. Coates will retire in order to give his whole attention to other affairs.

That the Hardware firm of Evans & Kelly, Savannah, N. Y., has been dissolved by mutual consent. R. H. Kelly retiring. The business will be continued by A. W. Evans. Mr. Kelly will remove to Walcott and engage in the Hardware business with his father at that point.

That Tulley & Davis, Lowville, N. Y., have dissolved partnership. Edgar A. Davis will continue the Hardware business and James H. Tulley the tinshop.

That J. W. Goodhue's Hardware store at Ipswich, Mass., was burned out in a large fire at that place on the 13th inst.

That S. A. Peck has sold his stove and tin store at Greenfield, Mass., to Williams & Knight.

That on the 12th inst. the Hardware establishment of C. Dreisbach's Sons, Lewisburg, Pa., was damaged by fire the extent of $3500.

That Joseph L. Eicher has sold out his stock of Hardware at Quincy, Ohio, and will enter some other business.

That the Hardware store of Edwards & Grant, Melrose, Ohio, was robbed on the 4th inst.

That the Hardware business of J. T. Emmons, Greenfield, Iowa, is now being carried on by W. F. Brandon.

That Edmund H. Coombs, son of the late J. Marsh Coombs, will, about February 1, embark in the wholesale heavy Hardware business at Fort Wayne, Ind. Harry Shirk, Frank Woods and Nelson Thompson, of the old firm of Coombs & Co., will be associated with Mr. Coombs.

That Hinds & Hedges, Lyons, Kan., have sold out their Hardware and Implement business.

That the Hardware stock of R. M. Essick, Sabula, Iowa, has been purchased by a new firm, the style of which is Schroeder & Butzlof.

That Marple & Wharton, Hardware merchants, Yates Center, Kan., have disposed of their business to Rankin Bros.

That Hoffman Bros.' Sedalia, Mo., have disposed of their Hardware stock to J. M. Offield, who will hereafter conduct the business. The consideration was about $12,000.

That George E. Reiner, Girard, Kan., has very much enlarged his facilities for the prosecution of his Hardware and Implement business.

That Tilly Bros., Hardware store at Brazil, Ind., was entered by burglars on the 2d inst.

That the Scott Hardware Company, Freeport, Ill., have certified to a dissolution and surrender of charter.

That Mackey & Maley have recently entered the Hardware business at Rhodes, Iowa.

That burglars entered the Hardware store of Switzer Bros., Defiance, Ohio, on the 1st inst., and carried away a lot of Revolvers, Knives and Razors.

That the Hardware business of Sneed & Johnson, Streator, Ill., has been purchased by W. A. Johnson.

That John Harper of Terral, Ind. Ter., has decided to open a Hardware and Implement house at Ryan.

That the Hardware firm of Erickson & Hellekson, Wheaton, Minn., have been succeeded by Erickson, Hellekson & Co., Edward Boley having become a member of the firm.

That the Hardware store of Hewitt Dent, Rockford, Ill., was robbed recently.

That the Oxford, Miss., Hardware stores of W. J. Jenkins and Lewis & McKey were burglarized on the 7th inst.

That J. G. Burt's Hardware store, San Bernardino, Cal., has been reopened.

That M. Scheid & Son have purchased the Hardware stock of J. B. Frazier, Fairmont, Minn.

That the Hardware store of Reinhardt & Osborne, Louisville, Ky., was damaged by fire on the 9th inst. The loss is estimated at $1500, which is fully covered by insurance.

A Remarkable Economy.

It may not be generally known that the Standard Oil Company are by far the largest consumers of tin plates in the United States. Their annual purchases reach an average of 750,000 boxes, or about one-third of the total imports. The tin plates are manufactured into oil cans, and a large proportion of the material is re-exported in this form, filled with petroleum. An interesting fact in connection with the subject was recently mentioned by a prominent New York tin plate merchant, as illustrating the way in which large economies may sometimes be effected by a little practical good sense judiciously applied. The Standard Oil Company for several years used a special size of coke plates—namely, 14 x 19¼ inches, each box containing 120 sheets, and giving material for 60 cans—two sheets forming the body of one can. Not long ago it struck one of the officials that the trimmings left over were excessive, and practically valueless. He accordingly set to work to remedy this waste, and soon discovered that two sheets of 14 x 18¾ inches would serve the required purpose equally well, and leave next to nothing in the way of waste material. The company have lately used special plates of this size, getting for the same price 124 sheets to the box, instead of 120 as before. They are, in consequence, able to make two more cans out of each box, or about 1,500,000 in the year, without the expenditure of another cent.

Factory Inspection.

The annual report of Rufus R. Wade, Chief of District Police of Massachusetts, for the year ending December 31, 1892, has just been issued in the form of a substantial volume of some 450 pages. The field covered by the report is broad, but the most prominent subjects are those concerning the enforcement of the laws relating to ventilation and other sanitary provisions in factories, school houses and public buildings; to elevators, provisions for escape in case of fire, safety from moving machinery, and in general to the well-being of factory operatives. The State of Massachusetts has always been a leader in legislation of this character, and this report is visible evidence of the practical value of the laws which stand upon the statute books. The report is, in fact, rather a collection of reports of the individual inspectors, compiled and arranged by the chief, and contains much of interest to every manufacturer. The general experience of the inspectors appears to be that the law is readily complied with when its provisions are made known, and that in the majority of cases the law is broken purely through ignorance. By far the larger portion of this report pertains to the ventilation of school houses and public buildings. Very complete plans and descriptions are presented of the heating and ventilating arrangements of a half dozen sample school houses, and serve as excellent instruction in this work. The inspectors, by several years of experience and numerous tests, have placed themselves in a position where they can judge reasonably well of the adequacy of any arrangement that may be presented in the plans which by law must be submitted before a building is erected. The recent amendment of this law, whereby the architect is made equally liable with the owner for failure to so submit plans, is reported to have had excellent effect.

Law Requiring Ventilation.

The law requiring good ventilation in school buildings was passed in 1888. It was at first received with a good deal of opposition, and a feeling that ventilation was nothing but a mystery. In the face of the fact that building contractors have had 50 years' experience with the present methods of heating, and only about five years with the improved systems of ventilation as now being generally adopted, the inspectors feel that they have met with marked success in the enforcement of the law. Among the plans presented in the report is one laid out by one of the inspectors and supposed to embody his conclusions, reached after extended experience. The planning of such a system, and its publication in this report are certainly for the good of the public; but when it is known that this arrangement was introduced—in accordance with these plans—in the district covered by the inspector who made them, the matter takes on a different aspect. As the acceptance of this school house by the district police depends upon the report of this inspector, it places him in the possible position of having to criticise his own work, something that most of us are not prone to do very severely. On the other hand, the report appears impartial in the presentation of the various plans, as both natural and mechanical methods of ventilation are shown, and no prominence is given to the names of the makers of the heating apparatus in the various buildings. Accompanying the report of each inspector is a list of plans submitted to him, with the changes recommended. These cover fire escapes, ways of egress and the like, as well as changes in ventilation. A general schedule gives the number of school rooms and the supply and exhaust in cubic feet per month per occupant in a large number of school houses in the State. No average is given, but the supply ranges very closely around 30 cubic feet, which represents the figure sought by the inspectors and considered by them as representing good ventilation. As the results in the schedule are stated to be based upon an average of 45 persons per room rather than upon the actual seating capacity in each room, they may be open to criticism, although there is no direct evidence of inaccuracy of results obtained by this method of averaging.

Boiler Inspection.

The inspection of boilers does not come directly under the duties of this body, but the appointment of a special inspector for one year, who should report to the chief of district police, is the cause of such a report being presented. It is excellent in its way, and covers a new field; for by provision of the act of appointment inspection was made only of uninsured boilers. As stated, the result of this inspection "is of the gravest importance, and suggests the imperative need of additional work in the same direction." The inspection included the boilers of the State institutions. Altogether, it covered 171 boilers, of which 23 were found without apparent defect. The total defects were 486, of which 114 were considered dangerous. Incompetency of firemen, engineers and janitors is commented upon severely. It is stated that "as a general rule the janitors in schools were found not to have had any experience at the time they become janitors." This only corroborates the testimony of those who have to do with the installation of steam heating and ventilating systems in buildings of this description. And the suggestion of the inspector that every engineer should be required to pass a satisfactory examination and receive a license before operating an engine would, if properly seconded by legislative action, remove much of the present objection to mechanical heating and

ventilating arrangements in public buildings.

Edward Atkinson, the well known economist, who has been gathering statistics of the present number of unemployed in the United States, says that the largest figures that can be claimed on any reasonable showing is 1,150,000. *Bradstreet's*, after careful investigation by its agents throughout the country, places the number at 800,000. But, as Mr. Atkinson points out, these figures must not be accepted as indicating the number actually thrown out of employment by the industrial depression, as it includes the great body of chronic idlers and those of uncertain employment who are always with us, even in the times of greatest activity. In his judgment those classes comprise two-thirds of the number of persons now returned under the head of "unemployed."

Students' Gathering at the Trade School.

In response to invitations to attend a students' gathering at the New York Trade School, to hear Chauncey M. Depew and other speakers, about 400 scholars, instructors, tradesmen and a number of ladies assembled in the large lecture room at Sixty-seventh street and First avenue, New York, last Tuesday evening. Among those present were: President R. Fulton Cutting, A. K. Mackay, J. Pierpont Morgan and Wm. E. Dodge of the trustees, and Edward Murphy and James Muir of the Plumbing Committee; John Beattie, T. L. Taylor, John Noll and L. Reiss of the Painters' Committee; James Hughes of the Masons' Committee, and Stephen M. Wright, Thomas J. Byrne, J. A. Rossman, and Wm. Schimpf, a graduate of the plumbing class of the school. The guests were received and seated by Harry Brill and J. Stanly Thomas, aided by several students as ushers, who distributed an attractive programme printed by the class in printing, '94.

At 8.25 p.m. R. Fulton Cutting introduced John Beattie who addressed the audience on "The Relation and Possibilities of the Trade School to Mechanics." In his address he said: "Thirty-six years ago I entered the painter's trade when a boy, was taught all parts of it, but in the competition for money making no time was left to teach the boy, and the question arose, Where shall we get our future mechanics? From my experience boys learn in a term here more than they could in two years in a shop. Make much of this start in learning your trade and continue to learn after you leave. Do your work honestly always and reflect credit on this grand institution."

James Muir was then introduced and spoke on the "Privileges and Possibilities of the Plumber," saying in brief: "I would counsel you to pay careful attention to your instructors, that your workmanship may be neat, but remember that the plumber shares with the doctor the responsibility for the public health. Learn all about sanitary matters, that sewer air and foul gases may be excluded from a building. You have a better chance than I had, and I know that boys learn more here in months than I did in years. In these days a sanitary plumber means more than a sign and a shop. It means a thorough knowledge of cause and effect. A copy I used to write at school was, 'Perseverance overcometh many things.' Keep at it and you can be a sanitary plumber. I don't know as I will say any more. I have said enough." The applause was such that Mr. Muir again spoke, saying: "The president called me first because he thought I couldn't do well after Mr. Depew. Boys! I'll tell you! All plumbers make mistakes! Don't be discouraged by yours and don't repeat this one. I sent a man to see why a tank was empty and he started a force pump without opening the cock at the tank. The result was he pumped the head out of the boiler and flooded the kitchen. But he works for me yet. He came back honorably and explained. I went to see the damage and the cook told me that luckily she was working on an upper floor or she would have been burned to death."

Chauncey M. Depew was then introduced.

MR. DEPEW'S ADDRESS.

In his address Mr. Depew said:

"I am glad to speak with men who amount to something like plumbers and painters and am glad to meet you here. Later in life you will appreciate the grandness of the institution and the great work of its founder and the invaluable opportunity that is here extended to the young men of this country. Colonel Auchmuty has conferred an invaluable favor on you all and others to come. Here you learn a trade, and in one term almost commence where other men leave off. In the Old World a young man must pursue a long, weary path. Here in this country of opportunities the public school educates a boy beyond his father and the trade school fits him at the start for labor that old workmen cannot perform. Every day I have men with college education applying for work for which they lack the special training. They must either go back and study some branch thoroughly or go through weary years of drudgery before they are valuable. You surpass such men on leaving here by possessing a special training which makes you valuable men at once. Make much of the opportunity and always be studying. There is a demand for you. Over 100,000 expert foreign workmen come here every summer and work and go home in the winter. You can fill their places if you know your trade thoroughly and work at it earnestly, and act absolutely honestly in everything. A man who is too well educated to carry a hod or be a plumber's helper, and who, from want of special training, cannot be a lawyer or a doctor, is at a disadvantage compared with you. To forge to the front is not easy, but honest, intelligent perseverance will put you among the leaders. Too many men work eager for quitting time. Some work to accomplish something. They do their work and can let another fellow go to a ball match or a yacht race. Such a man soon bosses a shop. You have as good a start as Commodore Vanderbilt. He had legs and brains. In youth and health you have energy; in legs you have transportation; in brains you have the management of the machine. I made a place the other day for a man who had walked 40 miles and impressed me that he could work and was willing. He will be valuable later on and I could not do without him. Be honest! A man once made $2000 out of me through sharp practice, and in relating my experience as a joke he lost an opportunity, through his dishonesty, to make an independent fortune. I want to call your attention to two words, one for idots, the other for wise men. 'I can't' makes tramps, loafers and miserable men. 'I won't' is one of the best in the English language. It means I won't drink or do this, that or the other that is useless or degrading. It makes manliness in youth and independence in old age. Of 50 men who grew up with me, eight-tenths are dead and rum is at the root of their early decay. The others own property and are honorable men. Boys, there is lots of fun without intemperance; lots of fun without reckless indulgence. Don't indulge in a luxury till you can afford it. If you make a dollar a day, save 10 cents. If you make more, save more. You may be told you are mean and have disagreeable things done to you; but when you have got your first hundred dollars you will feel so good that you will walk around among those people and say: 'Old man, you cannot do that again.'"

Mr. Depew probably never spoke to a more attentive and appreciative audience. After a vote of thanks to the speakers for the entertainment, the gathering dispersed.

"Merchants of Our Second Century" is the title of a work that is soon to be issued by the widow of the late G. G. Hallett. That no expense has been spared in its preparation is apparent from an advance copy. A historical design in gilt is a feature of the covers and the binding is very handsome. The text of the book consists of over 100 pages, is a fine specimen of the printer's art, and has been compiled with great care to make it valuable as a historical record. Steel engravings are profusely used, showing lifelike portraits of many notable business men, with a brief sketch of their career. In addition to these are portraits of all the Presidents of the United States, and a full account of the celebration at the beginning of our second century, with the addresses that were made. C. F. Diehm, 27 Union square, New York, is the publisher.

At Chicago, on the 13th inst., Judge Jenkins in the United States Supreme Court entered a decree affirming the sale of the plant of the United States Rolling Stock Company to Thomas F. B. Parker for $350,000. The decree provides that $35,000 is to be held by the court until the claims of Carnegie, Phipps & Co., Hibbard, Spencer, Bartlett & Co. and A. L. Adams are decided. The sum of $16,799 is to be applied at once to the payment of part of the indebtedness of the company under the first mortgage bonds. The bondholders are to receive 5 per cent *pro rata*, without discrimination between principal and interest. Judge Jenkins also denied the petition of Carnegie, Phipps & Co. in the United States Rolling Stock Company case asking for the discharge of the receiver.

Mayor Hopkins of Chicago has hit upon a plan for clearing the city of idle tramps and vagrants who are unwilling to work on the streets in return for meals and lodgings. He has issued orders that every man who applies at the police stations for lodging is to be offered work. If he refuses he will be driven by the police out of town.

THE LETTER BOX.

A Warning.

We have the following letter from W. T. Twitmire, Bellefonte, Pa., which explains itself:

A man is going over the country and passing bogus checks who operates in this way: He comes into a town, rents a house and strikes a stove man for a good stove and a whole outfit of tinware, piping, &c., and in payment gives a check larger than the amount of his bill, getting the balance in money. The last I heard of him he was in Sunbury, operating in this way. I would like to see the work stopped, and would help to prosecute him. He puts the stoves into the house before he leaves town to get his family. He is a large man, about 5 feet 10 inches in hight, probably 55 years of age, weight 175 or 180 pounds, smooth face, and when here wore a small brim slouch hat. He indorses the checks as "Thomas Smith," the checks being drawn on New York banks. The one here was on the Farmers and Mechanics' Bank of Elmira.

The Tin Plate Gauge Marks.

From C. B., *New York.*—Will you kindly inform me through the Letter Box what is the full meaning of the initials "IC" as applied to tin plates?

Answer.—The origin of the letters IC, IX, &c., as describing the gauge of tin and terne plates appears to be wrapped in the mist of obscurity. No history of the trade, so far as we have been able to observe, explains their actual meaning or states when they were first used. Whatever original meaning may have been attached to the letters has, however, been lost in the course of time, as they are now mere arbitrary signs, IC designating the thinnest gauge of plates, IX a thicker gauge, IXX a still thicker plate, and so on. The most plausible conjecture as to the original meaning of IC is that it represented a hundredweight (112 pounds), the "C" being written as an abbreviation of hundredweight. It is further supposed by some authorities in the trade that IX, on the same principle, was used to designate an extra weight of sheet, the additional crosses following naturally to mark those still heavier. One of the oldest men in the tin plate trade, whose opinion on the subject was asked and whose experience dates back to the '50s, states that he has never met, even among the oldest manufacturers, any one who knew the meaning of the marks. Most of them, he observes, exhibited very little curiosity on the subject, taking the ground that "they had always been used." This authority inclines to the belief that they were originally mere arbitrary marks, made probably by common workmen to designate the material they were accustomed to handle. For many years the term "slight" applied to the lighter or thinner sheets, and one of our correspondents suggested that some phonetically inclined workman took *c-light* as a symbol for slight, omitting for brevity's sake all but the *c*. However that may be, the whole subject of the origin of the marks appears to be no more than a matter of conjecture. We should, however, be glad to hear from any readers of *The Metal Worker* who may be able to throw light on this interesting question.

Noise in Boiler and Pipes.

From F. R. M., *Warrensburg, N. Y.*—Will you kindly inform me through the Letter Box the cause of a jarring, rumbling noise in pipes and boiler which starts upon opening a hot water faucet in any part of the house? The noise can be heard all over the house, no matter in which room the faucet is opened, and sounds as though the pipes and boiler would be torn to pieces. The boiler holds 32 gallons and the pipes are ¾ inch.

Answer.—The trouble in question is probably due to one of two causes. Where there is a strong water pressure, oftentimes, on closing the water faucet quickly, the jar is transmitted to the fixtures with such force as to cause a trembling and a rattling, as described. Another cause is due to the generation of steam where the pressure of water to supply the boiler is very light, which allows steam to accumulate at the top of the boiler, in the water back and in the circulating pipe. Immediately on the opening of the hot water faucet, cold water rushes into the boiler to take its place, and the steam that may be at the top of the boiler is at once cooled and condensed, leaving a vacuum, which is filled by a rush of cold water, and where the water meets the result is very similar to bringing a hammer down upon an anvil with the same force. Condensation and vacuum may be formed in the return pipe from the water back, or in the water back, by the steam coming in contact with a cold part of the pipe or cold water entering the water back.

Location of Air Supply.

From SNIPS, *East Hampton, N. Y.*—In answer to "W." of Warsaw, N. Y., who responds to the query of "Snips" in the issue of December 2, the register manufacturers give the capacity of a 10 x 14 register, less the grating, as 93 inches. A 10-inch pipe is equal to 78 inches only. A pipe of 10 inches diameter could be put in a 9 x 14 register box in an oval form, or the box could be made extended to take in pipe of that size.

Boiler Too Large.

From S. E. K., *Ohio.*—I have connected a water front in a 7-inch portable range with an 80-gallon boiler, and since doing so the range works slow in baking and cooking and the boiler never becomes so hot in the lower portion that discomfort is felt from placing a hand upon it—in fact, near the bottom it is always cold. Sometimes the water drawn from the boiler is scalding hot, even when the boiler is cold at the bottom. There is no noise and the circulation seems to be easy, and though I put in a large boiler so as to furnish plenty of hot water, my customer does not get enough and has to wait too long for it; besides, the stove works too slow and ashes accumulate very quickly against the water front. Where does the trouble lie and what shall I do to remove it?

Answer.—The boiler is too large for the fire, consequently the water keeps the water front cold, which chills the fire and makes it dead next to it for some space out into the fire chamber, and the air which passes through the dead coals cools the top of the range and the oven more than the remaining narrow strip of fire can overcome. This accounts for the slow operation of the stove. It is a common error to use boilers that are too large, with the idea of having an abundance of hot water, and the result is frequently a large quantity of water that is warm but not hot enough to prove satisfactory. A small quantity of water such as our correspondent calls "scalding hot" will mix with a large quantity of cool water when warm water is needed, which shows that hot water is the most useful. The water in a small boiler can be quickly made hot and does not absorb so much heat from the fire as to interfere with the operation of the stove. To answer the questions put, the large boiler is the cause of the trouble. A 25-gallon or 4-foot by 12-inch boiler is a better size to use with the stove described, though some might prefer a 30-gallon boiler. If a water back, properly constructed so as to avoid air and steam pockets, and a small boiler is used, set so that the bottom is above the water back, and the connections between them are made with large pipe and one size larger pipe is used for the return pipe to the boiler, circulation will be free and there will be no noise. Small boilers will be found more satisfactory in the majority of cases for supplying hot water. The use of boilers that are too large is a common error. Frequent attention to the fire to keep it bright and free from ashes when a large

quantity of hot water is needed with a small boiler will enable it to supply it satisfactorily.

A Letter from the Hawaiian Islands.

From J. E., *Honolulu, H. I.*—The year just closed has been an eventful one in the history of our island community. January 17, 1893, will go down to posterity in our reef bound home as the day when the people declared themselves forever free from a dissolute, wasteful, semi-barbarous monarchy, and took steps to secure the union of these islands to the United States. Since then much has been said and written on the situation, and the anniversary of the day will probably see all the evidence that has been collected up to that time laid before Congress. The last act in the drama on this side of the water has been the demand of your Minister for the Provisional Government to vacate the situation in favor of the ex-Queen and the reply of President Dole and the Councils to his demand, both of which I inclose as published in the local papers to-day.

They speak for themselves. I am a resident of these islands for the past 16 years, in business for myself 12 years, and profess to know something as to the conditions under which we have existed in the past, and therefore say that if the acts of George III justified the revolution of '76, then surely our little revolution was equally justified by the acts of Liliuokalani. We hope that Congress, as a matter of justice, will request the resubmission of the treaty of annexation withdrawn by Mr. Cleveland on his accession to the Presidency, and that a commission may be appointed to come down here and inquire fully and thoroughly into this matter.

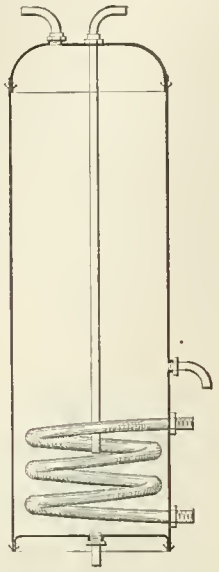
It is deplorable that Mr. Blount was so prejudiced against the manner in which the revolution was brought about, and used it as a pretext to besmirch the character and acts of Jno. L. Stevens, the American Minister at that time. This was done through inviting royalist evidence, while only two of the 13 members of the Committee of Safety were given opportunity to testify before Blount. As a member of that committee and of the present Advisory Council I have lately subscribed with other members to an affidavit declaring that neither before nor during the progress of the revolution had there been any arrangement or understanding between the American Minister and revolutionists, and that we neither expected nor had the assistance of the United States Marines in that crisis. As before stated, we hope Congress may see fit to act with a due regard for the interests that are being sacrificed by reason of the protracted delay in negotiations. Should nothing be done by that body, we intend to immediately put our house in order, establish a republic with as liberal a franchise as may be compatible with our purposes and quietly wait until the people of the United States, through the election in '96, may have an opportunity to pass on our proposition, which will undoubtedly be resubmitted after March, 1897.

These islands are in every sense an American colony and dependency, and must finally be accepted in some way into the federation of States. May God speed that day, is the sincere prayer of every well-wisher of the Hawaiian race.

Business has naturally been dull during the past year, but that makes no difference with our subscription to *The Metal Worker*.

Boiler with Steam Coil.

From J. B. R., *Atlanta, Ga.*—The building I am in is heated by steam, and I want to have a supply of hot water for my work. I can get the steam and water readily enough, but am undecided about heating it. I am recommended to use an ordinary kitchen boiler with a steam coil in to heat the water. I know that an upright boiler



Boiler with Steam Coil.—Fig. 1.—Upright Boiler with Spiral Coil.

is preferable where a water back is used, but a horizontal boiler could be used to better advantage, so far as space is concerned, if it is just as satisfactory in operation. I send you a sketch of the two boilers recommended, and would like your opinion as to which is the better. Fig. 1 shows the upright boiler with a spiral coil, and Fig. 2 shows the horizontal boiler with a return bend coil in it. The upright boiler has the usual openings for a water back connection, which can be used at the time of year when steam is not employed for heating, and the openings can be plugged when the water back is not used. I am told that the horizontal boiler can also be furnished with these openings.

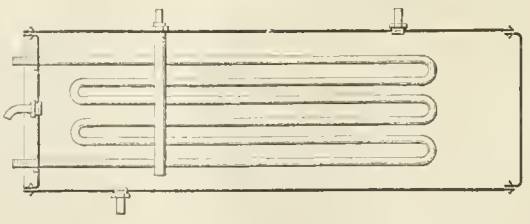


Fig. 2.—Horizontal Boiler with Return Bend Coil.

Answer.—There is no difficulty in heating water by steam passing through such a coil as is used in either of the boilers shown, providing that the boiler and coil are set so that the water of condensation can run off. The hot water at the top of an upright boiler would not be so quickly subjected to the cooling influence of cold water that would enter the boiler to take the place of hot water drawn off as it would in the horizontal boiler. Aside from these there is little choice between the two styles. The same would be true when connected with a water back, except that there would be a slight difference in favor of the circulation in the upright boiler. Horizontal boilers with a steam coil can be furnished with openings for water back connections. If the horizontal boiler is most convenient, there is no reason against its selection. The pressure of steam and the size of the boiler regulate the length of the coil. Ordinarily, however, 1 lineal foot of 1-inch pipe is used for every 5 gallons of water to be heated.

Paste Stove Polish.

From C. K., *St. Louis, Mo.*—Can The Letter Box or some of its readers give me a receipt for making a good liquid and paste stove polish?

Note.—The Letter Box is open to the contributions of our readers on this subject. A stove blacker who had tried many different mixtures preferred the following for easy work and excellent results. Mix pulverized Ceylon lead with first-class asphaltum varnish until a paste of the consistency of putty is secured. Sometimes a few drops of litharge and oil of sassafras was added. In using, a small quantity of the paste is mixed with deodorized benzine and applied to the stove with a paint brush. A stove coated with this blacking may stand a day or two before it is polished and a good polish can be quickly secured.

Roofing Queries.

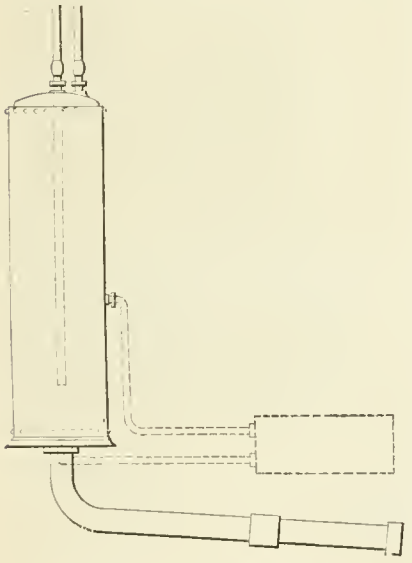
From S. P. K., *Topeka, Kan.*—This is the time of the year when, as a rule, the roofing readers of *The Metal Worker* are not so busy as they will be later on, and an exchange of experience on some of the minor details of roofing might be of advantage. I would like to hear from some of them as to the cost of standing seam roofing. How long does it take to edge a box of tin on an ordinary folder when it is to be used in strips for standing seam roof? Also, how long does it take to put a box of tin together, assuming that four rolls are used to a box? Then, if the tin is soldered in the rolls, how long does it take to solder a box of tin and how much solder is used? Then I would like to know what is considered an average day's work. I reckon about 600 square feet is a day's work for a man when the roof pitches two ways and a hanging gutter is used to catch the water. I would also like to know the different ways they finish at the edges. These are plain every day questions, but a review and comparison of these items which bear on the cost of the work from different parts of the country will be interesting.

Note.—We hope our readers will respond to the request of this correspondent from their experience with such sketches as may be necessary to show their methods.

Better Than a Water Back?

From G. M., *Camden, N. J.*—A friend of mine contends that better results can be secured from a kitchen boiler by running a pipe from the bottom of it to the fire and extending into it some 6 or 8 inches than can be secured with the usual water back connection. The illustration presented herewith shows his idea in the large pipe from the bottom of the boiler, which he claims must be of twice the capacity of the pipes ordinarily used to accomplish the results which he claims. The dotted lines to the boiler show the usual pipe connections to the water back. He claims the water will circulate through the single pipe the same as if connected in the regular manner, because hot water ascends and cold water descends. We have left the matter with *The Metal Worker* for a decision.

Answer.—The idea advanced is not new, and if the device possessed the merit which is claimed, the more ex-



Better than a Water Back?

pensive water back connections of to day would have long since been supplanted by it. That circulation of water will take place in such a pipe is true, but in an irregular way. In operation the device would have a tendency to create steam, and there would be a continual struggle for the hot water to find an exit against the pressure of the cold water. The water in the extreme end when the fire was excessively hot would be rapidly generated into steam, and the continual condensation and creation of vacuum to be filled by an inrush of water would be a severe strain on the piping, and create a noise that would be anything but pleasant.

Fails To Bake On Bottom.

From FORTUNE, *Philadelphia.*—In reply to "W. S.," who inquires in *The Metal Worker* of December 20 for the reason why ranges sometimes fail to bake on the bottom, would say that in our experience with these complaints the fault has been found principally with the management of the range. The most common fault is that the article to be baked is placed on the oven slide, which brings it so near to the top oven plate that it burns at the top before the bottom has had time to bake. In our opinion, the only proper place to bake is on the bottom plate of the oven. Another common fault is too hot or too high a fire. A sluggish draft is also sometimes the cause. That a chimney draft will draw up a lighted newspaper is not positive evidence that there is a good draft. In more than 95 per cent. of complaints of this kind we have not found the trouble to be in the range, and we think that if dealers would go to the trouble to bake in a range themselves, even if it takes several hours of their time, it would save them and the manufacturers a lot of trouble.

Computing Area and Capacity.

From W. F., *Warren, Ill.*—Having seen the question asked in *The Metal Worker*, "How shall I find the capacity of a furnace pipe?" and never having seen the rule that I use published, I give it for what it is worth. It may not be absolutely correct, yet for ordinary purposes it will furnish good results, and is much easier than the majority that I have seen given. Multiply half the circumference by half the diameter. For instance, take a 10 inch pipe. The circumference is 31¼ inches; half the circumference is 15¾, half the diameter is 5; $5 \times 15\frac{3}{4} = 78$, and is within a fraction of the true capacity of the pipe. To find the capacity of a round vessel, with sides that are straight and a diameter that is the same at the top and bottom, multiply half the diameter by half the circumference and the result by the depth, which will give the number of cubic inches contained in the vessel. Divide this result by 231 and you will have the capacity of the vessel in gallons, or by dividing the result by 2150.42 you will have the number of bushels the vessel will contain.

Note.—But for the allowance for the thickness of the metal our correspondent's rule for the capacity of a pipe is absolutely correct. Half the diameter multiplied by half the circumference will give the exact area of a circle, all that is necessary being to know precisely what the diameter and circumference are.

Rattling Noise in Boiler.

From A SUBSCRIBER.—There is a boiler in use in my town which, after the fire has been started in the stove for some time, makes a rumbling noise, which continues for an hour or so. It is a low pressure boiler and the expansion pipe is open and the tube is in the right place in the boiler. There is no trap in the connecting pipes and yet the noise continues. We shall be glad to receive any suggestions as to the cause from either *The Metal Worker* or its readers.

Note.—Our readers may have some opinions to express on this subject. In the meantime, we would suggest that the noise is due to imperfect circulation, caused by some defect in connections. Some of the things that could be done to relieve the trouble would be to raise the bottom of the boiler so that it would be above the top of the water back, that the pipe leading from the boiler to the water back would have a positive descent. The pipe which carries the hot water to the boiler should be one size larger than the lower pipe. All the joints should be wiped so that they will be free and open. If the couplings used have a leather washer care should be taken that these washers do not protrude into the waterway, to reduce its size and create an eddy. Some small and loose obstruction that can move will oftentimes create an eddy which will cause vibration through the pipes and make a noise that is heard in the boiler. If the trouble is in the pipe that supplies the boiler, the supply may be so reduced as to aid in the generation of steam. If the steam passes to the boiler before it condenses the noise would be in the boiler. Some seemingly small detail is different from what it should be, and must be found and changed to stop the noise. The principles which govern circulation are understood by our correspondent and will be his best guide in hunting for the little thing that causes the trouble.

One of the largest real estate transactions on record was consummated a few days ago, in the final transfer by the State of Florida to the Atlantic and Gulf Coast Canal and Okeechobee Land Company of 2,000,000 acres of rich land in the heart of the semi-tropical region of Florida. The transfer was the outcome of a contract entered into between the State of Florida and Hamilton Disston, of the well-known firm of Philadelphia sawmakers, who is president of the above named corporation, by which the latter undertook to reclaim the vast tract of country in the vicinity of Lake Okeechobee, theretofore subject to constant inundations. The work has been successfully completed after 12 years of hard work and a large expenditure of money; and a continuous waterway of 350 miles has been opened from Kissimmee City to the Gulf of Mexico, which will be of the greatest benefit to Florida. The grant to Mr. Disston's company in recompense for these services places about 3125 square miles of land at their disposal.

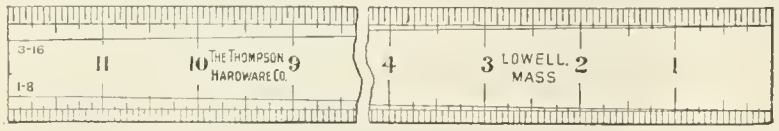
Apropos of the present agitation for the strengthening of the British navy, it is interesting to note that the tonnage of war vessels launched in England last year was very much less than that of several years preceding. The following indicates the total number and tonnage for five years, without including torpedo boats:

	Vessels.	Tons.
1889	31	52,110
1890	20	64,260
1891	19	107,985
1892	22	141,300
1893	14	33,330

The latest advices from Australia speak of great distress among the unemployed in that country. To relieve the depression South Australia is locating a co-operative community, aided by the Government, on a million acres of land in Kangaroo Island, which will be occupied at starting by 1000 unemployed. Some of the other colonial governments are also granting tracts of land for a similar purpose.

Improved Shrinkage Rule.

The Thompson Hardware Company, Lowell, Mass., are offering the 12-inch scale shown herewith, especially designed for the use of pattern makers and draftsmen, or others who are interested in the shrinkage of the various metals. Upon the four corners of the scale are drawn lines parallel with the edges of the scale. Beginning at the end of the scale and at the parallel lines are drawn supplementary lines at an angle to the parallel lines and the distance these lines are apart at the opposite end of the scale is determined by the amount of shrinkage it is desired to indicate.



Improved Shrinkage Rule.

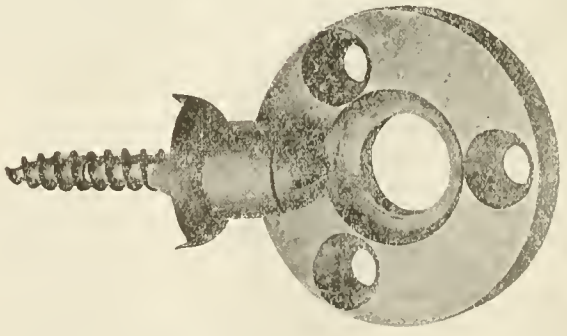
Thus for iron the lines are apart $\frac{1}{8}$ inch at the end of the 12-inch scale, as iron shrinks that amount per foot. For brass the lines are $\frac{3}{16}$ inch apart. For iron and brass combined $\frac{5}{16}$ inch and for a double brass shrinkage $\frac{3}{8}$ inch, &c. Therefore, to find the shrinkage for any amount, say 10 inches, it is only necessary to add to the standard measurement the distance the lines are apart at the 10-inch graduation. This method, while combining four different shrinkage rules in one, in no way interferes with the use of the scale for standard measurements. It is explained that in making patterns for castings it is necessary to allow for the shrinkage of the particular metal or composition used in making the casting, and if the casting is to be for a metal pattern from which other castings (possibly of a different metal) are to be made it is necessary to estimate not only the shrinkage of the final product but also the shrinkage for the metal pattern. It has heretofore been customary to make use of arbitrary rules so graduated that the divisions exceeded the standard divisions in proportion as it was necessary to compensate for the shrinkage of the metal or metals used. This, of course, necessitates the employment of a large number of scales of different dimensions. It is also customary for draftsmen to estimate for shrinkage by allowing a fractional part of an inch for each inch of measurement, according to the metal used, both of which it is the object of this invention to avoid. The rules are finely graduated and are warranted accurate by the manufacturers.

Advices from Hartford, Conn., are to the effect that throughout Central Connecticut there are evidences of a steady revival in the industrial situation. It is claimed that Hartford has suffered comparatively little, that no factories have been shut down, and that hands who were laid off are gradually getting back to their work.

A notable figure passed off the stage in Baltimore, Md., last week, in the person of George W. Skinner, the veteran shipbuilder, who died at an advanced age. He learned his trade with his uncle, Zackariah Skinner, the pioneer shipbuilder of Baltimore, and later, in conjunction with his father and two brothers, acquired a great reputation as builder of some of the most famous of the old clipper ships. George W. Skinner was the designer of some of the fastest sailing craft ever built.

The Standard Pattern Dowel.

The illustration herewith given represents a new pattern dowel offered by W. S. Hawker, Broad and Adria streets, Philadelphia, Pa. In use the plate is placed at random in the drag half of the pattern by boring a hole of a diameter and depth to match the plate, after which the plate is placed in the hole and the pin dropped in position in the plate, without the screw, however. The small sharp points on the base of the pin now project slightly above the surface of parting. On the points the cope half of the pattern is now placed in position and matched around the edges, after which it is lightly tapped with a mallet, thus embedding the points in the cope half of the pattern. The cope half is now taken off and the round headed screw is driven through the pin, completing the job. It is explained that by reason of the pins being in their true position within the plates when the pattern is matched there can be no binding of the parts, and that the placing of the three or more pins at the same time is greatly simplified; also that either part of the pins may be easily taken out and replaced with perfect accuracy in case of alterations, and, as they may be used repeatedly, the makers claim that they are cheaper to use than wooden dowels. The dowels described have been designed with special reference to close economy as regards placing them in patterns and the obtaining of perfect accuracy in matching partings. The manufacturer claims that the difficulty usually experienced in matching partings with various forms of metal dowels is entirely obviated in these. The dowels are made in four sizes: $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$ and $\frac{5}{8}$ inch, samples of which will be sent by the maker upon application.



The Standard Pattern Dowel.

The Commissioner of Navigation at Washington has decided that the vessel "Augusta," formerly the property of citizens of Venezuela, but now belonging to the Neafie & Levy Ship and Engine Building Company of Philadelphia, is entitled to American registry. The decision has given much satisfaction in the Quaker City, as it means, among other things, the employment of a number of Philadelphia machanics in rebuilding the vessel.

Aluminum Hollow Ware.

In an article on aluminum prepared for the 1892 volume of the "Mineral Resources of the United States," Captain Alfred E. Hunt of Pittsburgh says: The production of cast aluminum hollow ware has just been started as a new industry that will undoubtedly be successful. Aluminum tea kettles are now on the market, and aluminum coffee pots and tea pots will soon follow. Hollow ware castings have been successfully made in the form of tea kettles, with only $\frac{1}{16}$ inch thickness of metal in the walls of the kettle, which is a remarkable evidence of the good casting qualities of aluminum. Another advantage which may be incidentally spoken of here is that these castings are more malleable than those of any other metal. Thin castings of aluminum tea kettles have been hammered in and bent almost double before breaking. The Smith pressure casting process has been very successfully used for casting aluminum articles by the Passaic Art Casting Company, of Passaic, N. J. By this process the finest details of the engraving, chased and *repoussé* work are brought out in aluminum castings with a finish equal to that of electrotypes. Molds either of sand or of a liquid plaster of Paris composition are made in as flat a shape as possible, so that they may be piled on top of each other; the gates from each mold leading to a central sprue. The effective penetration of the molten aluminum to every part of the matrix is secured by the collection and temporary detention of the entire charge of molten metal in a suitable holder above the molds, where a prompt and continuous transfer of the molten metal from the bottom of the holder to the matrix cavities is obtained by the aid of increasing the pressure at the rear and decreasing the pressure in front of the advancing stream of molten metal by means of a piston covered with asbestos, which fits closely into the cylinder above the receiver for the molten metal, the mold itself being air tight and in connection with the vacuum tank of an air pump. A thin diaphragm of asbestos used to hold the molten metal in the receiver before it enters the mold is burst by the pressure placed upon the metal by the piston, allowing it to flow suddenly into every minute cavity of the mold. Extremely light and sharp aluminum castings, having a remarkable solidity and freedom from blow holes, are obtained by this process.

The Commissioner of Navigation at Washington has decided that the vessel "Augusta," formerly the property of citizens of Venezuela, but now belonging to the Neafie & Levy Ship and Engine Building Company of Philadelphia, is entitled to American regis-

PLUMBING and GAS FITTING.

Domestic Electrical Work.*—VIII.

By W. A. W.

Automatic Fire Alarms.

All the alarms described up to this time have been what might be termed manual—that is, it has required a manual operation to start them, either intentional or otherwise. We now come to that class which are strictly automatic—that is, they will perform a certain duty under certain circumstances without any attention or manual assistance. In this class are included temperature regulators and fire alarms, but as the former are extensively advertised in connection with heating apparatus and full directions for their application furnished with each outfit, we will not consider them.

The apparatus used for fire alarms varies with the requirements of the case. If it is only desired to make known the presence of fire in the building an ordinary electric bell will answer the purpose. In large buildings, however, containing many rooms it is of the utmost importance to know at the earliest possible moment on just which floor or in just which room the fire is located. In this case an annunciator must be used. In an establishment

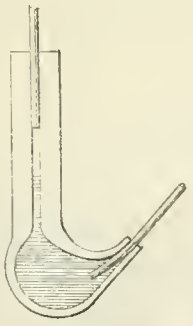


Fig. 15.—Electro-Mereurial Fire Alarm Bulb.

where a watchman is on duty at all hours of the night, it is only necessary to locate a bell or annunciator at some point in the building where the watchman will be sure to have his attention attracted to it. In case no watchman is on duty the circuit may be carried to some neighboring point where an alarm would attract attention. It is, however, much better in the case of establishments having no watchman to run the circuit direct to the fire engine house, where if no other apparatus of this kind is already installed a simple electric bell will answer every purpose, placing an annunciator on the outside at the principal entrance of the building.

Fire departments, as a rule, will be found only too willing to have these private alarms connected direct to headquarters, as it is greatly to their advantage to be apprised of a fire while yet in its incipient stage. By placing the annunciator on the outside of the building the department, on arriving, can at once determine the exact location of the fire within. These appliances, while of the greatest importance in hotels, factories, public buildings and business houses, are also very useful in the dwelling house, not so much as a matter of necessity, but for the reason that they inspire a feeling of security, which every one loves to enjoy on retiring for the night. Fig. 15 shows the electro-mercurial alarm. This is a glass bulb containing mercury, constructed on the same principle as a thermometer, with a platinum wire fused in each end, the lower wire being in constant contact with the mercury, the upper one terminating just far enough above it to come in contact when the temperature for which it is set is reached by the column of mercury rising in the tube. These thermostats are usually inclosed in copper shields, to protect them against accidental breakage.

In installing a system of automatic fire alarms lay out the circuit as described for fire alarms in Chapter IV, and shown in Fig. 9, substituting the thermostats for the push buttons. The thermostats must, however, be placed in the ceiling, as in case of fire in a room the excessive heat would be felt there first. In large rooms they should be placed about 20 feet apart, so that the heat of a fire would in no case have to spread over 10 feet in any direction without affecting the thermostat. These instruments can also be used in connection with the alarm shown in Fig. 9, by simply connecting them as additional push buttons, and thus have a doubly secure system. The most important points in a dwelling to look after are the kitchen, basement (if a heating apparatus is used there), and around chimneys in the attic. These thermostats are usually set for 120° F., but when used in places where a normally high temperature prevails they can be had set to a higher degree.

For the benefit of those who wish to make their own thermostats the one shown in Fig. 16 will be found as efficient an instrument as can be constructed. A strip of spring steel about the thickness of No. 26 iron, 7 inches long and $\frac{1}{2}$ inch wide, and a strip of hard rubber of the same size about $\frac{3}{32}$ inch thick, securely riveted together makes an excellent thermostatic bar. Fasten one end of this bar and allow the other free play. Then place the set screw as shown. Make electric connections with the set screw and with the fastening, and the thermostat is complete. The difference in expansion and contraction being so great between hard rubber and steel a change of 1° of temperature will cause the bar to warp one way or the other, bending toward the steel with a rising and toward the rubber with a falling temperature. This thermostat also possesses the advantage of being adjustable in case circumstances should require a change.

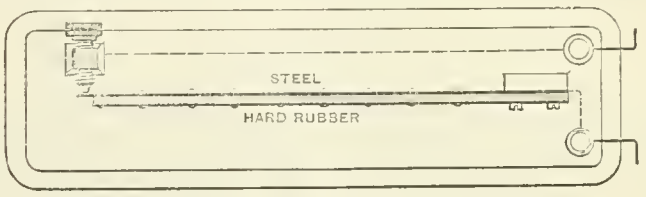

Fig. 16.—Rubber and Steel Thermostat.

Connecticut Master Plumbers.

The following notice is being sent to members of the Connecticut Association of Master Plumbers from New Haven, dated January 22, 1894:

The fourth annual convention of the Connecticut Association of Master Plumbers will be held at Hartford, Conn., on February 15, 1894, at 10 a.m., in Putnam Phalanx Armory, 6 Haynes street, corner of Pearl. Your presence is requested, and it is very desirable that every member should be in the hall at 10 a.m. prompt.—S. E. Dibble, president; James Ahern, J. B. Weiant, A. J. Clerkin, C. S. Eames, R. H. Stothart, L. H. Mills, Executive Committee.

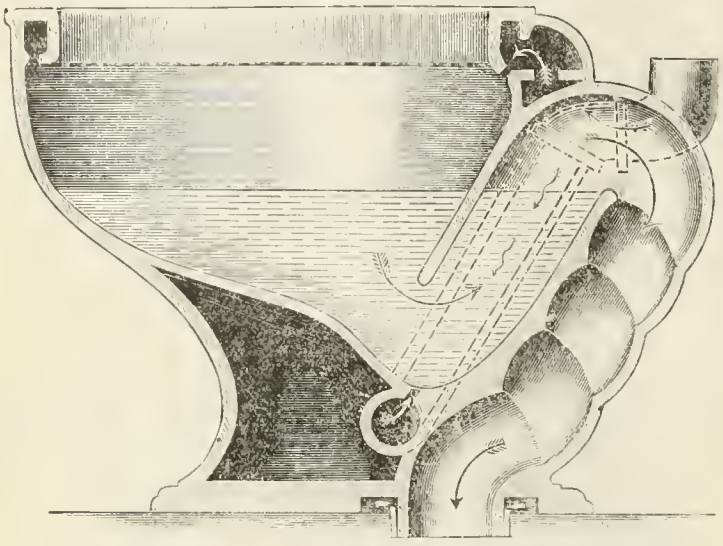
President S. E. Dibble of 639 Grand avenue, New Haven, has perfected the preliminary arrangements for the banquet and meeting places. The Hartford master plumbers are taking unusual interest in the affair and are very enthusiastic. Robert Morgan of 30 Center street, New Haven, who is chairman of the Sanitary Committee, is expected to give an interesting essay on "Sanitation in Dwelling Houses." George W. Minor of Waterbury will speak on the "Apprentices." Edward Mahl of Hartford will speak on "Plumbers' Legislation." Recording and Corresponding Secretary A. J. Clerkin of 779 Grand avenue and J. G. Shearlock, New Haven, will also deliver addresses.

Following the convention the 150 local members and guests will adjourn to the United States Hotel in the afternoon, where a banquet will be served.

The Metal Worker appreciates the compliments of the St. Louis Master Plumbers extended in the following invitation, with a ticket: "The Master Plumbers' Association of St. Louis respectfully request your presence at their grand ball, to be given at Liederkranz Hall, Thirteenth street and Chouteau avenue, on Wednesday evening, January 31, 1894. Arrangement Committee, D. J. Collins, chairman, Jeremiah Sheehan, Martin J. Ward, P. H. Callahan and John P. Kelleher."

The Bourse Syphon Jet Closet.

In honor of the new trade exchange building now being erected at Philadelphia, the Bourse is the name given by the J. D. Johnson Company, 139 and 141 North Seventh street, Philadelphia, to their new syphon jet water closet, which is illustrated herewith in sectional view. The feature of the closet, on which a patent has been granted, is the discharge passage, which is direct and spiral shaped. This, it is claimed, prevents its stoppage by sticks that may enter, or other matter likely to obstruct the force of water. The jet at the bottom of the bowl is said to lend additional force to the syphonic action, and the twisting shape of the passage to cause a whirling of the water that thoroughly scours every part. The closet has been used in a number of buildings, where it has given satisfactory results.



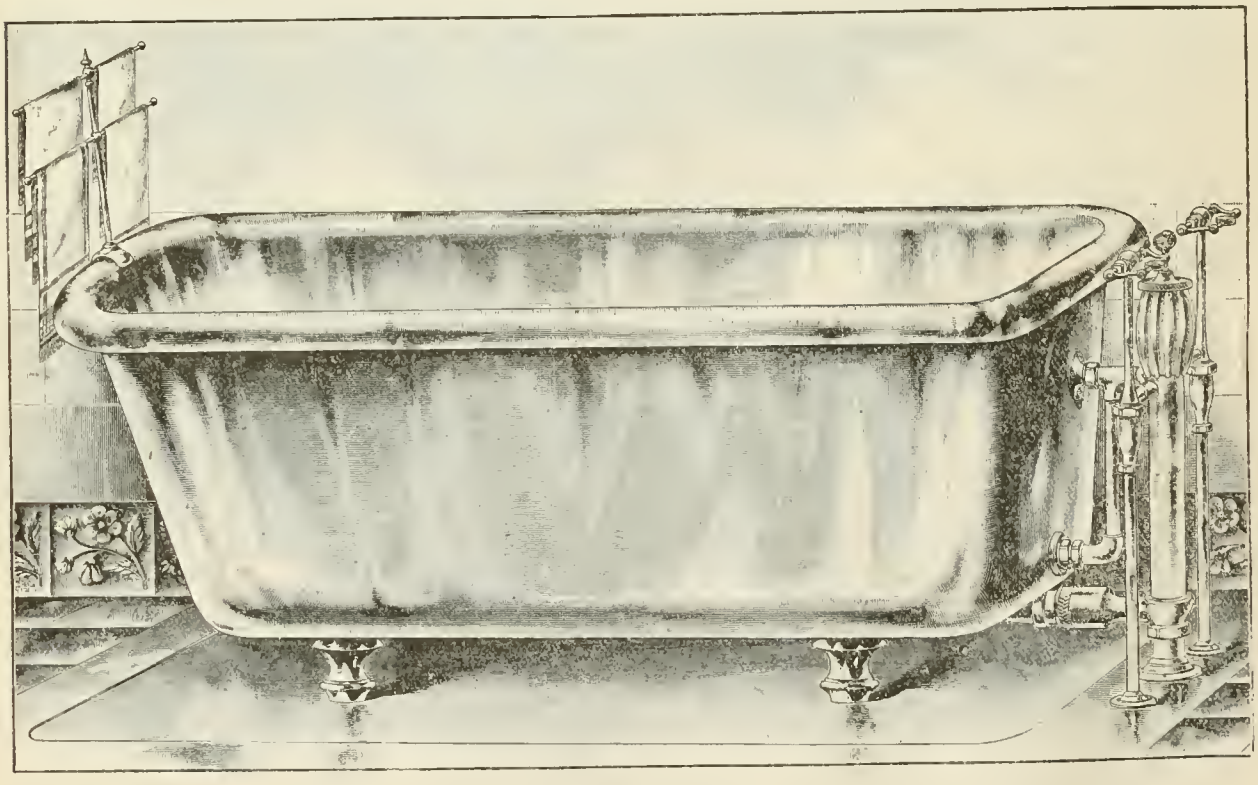
The Bourse Syphon Jet Closet.

Cooper's Aluminum Roll Rim Bath.

What is referred to as probably the largest casting ever made in aluminum is the bath recently introduced by the W. S. Cooper Brass Works of 444–448 North Thirteenth street, Philadelphia. After two years of experiments, the Cooper Company have succeeded in making a large casting for bath purposes. Aluminum is particularly suitable for baths, being light in weight and susceptible to a high degree of polish which will not tarnish easily. The metal is practically imperishable, and will neither corrode, discolor, crack, warp, split nor chip. A sink made of it has been in use by workmen at the Cooper factory for nearly two years, during which time it has been subjected to severe trials; but it remains uninjured and retains its original brightness. The bath, as shown in our illustration, is cast in one piece and has a 3-inch roll rim. The thickness of the metal is about $\frac{3}{8}$ inch. The outside length of the bath is 5 feet 10 inches, the outside width 2 feet $9\frac{1}{2}$ inches, and the outside depth 1 foot 10 inches. The weight, with feet, but exclusive of fixtures, is 145 pounds. The inside and outside surfaces are alike, highly polished. In shape the bath is handsome, and combines the good features of both Roman and French patterns.

The cost of aluminum at the present day necessarily makes such a bath a rather high priced article; in fact, as the makers say, "it is not a poor man's bath." And yet, we understand, the price exceeds but slightly the price of a porcelain bath, of which bath the aluminum is destined to become a rival. There is said to be less chilling effect on hot water and the person of the bather upon contact with the bath when an aluminum bath is used.

The bright appearance of the metal is permanent and no rubbing or polishing is necessary. The bath is unaffected by acids, alkalies or gases, and should water, after use, be allowed to remain in the bath over night, the metal is not affected at the surface of the standing water. The bath is practically indestructible and cannot be fractured under the most severe blows. One size of bath only is manufactured at present, but other sizes are in preparation and a full line will soon be ready for the market. The fixture shown in the illustration is the Protectus supply, waste and overflow combination, manufactured by the Cooper Company and now appearing on the market for the first time. The combination contains waste and overflow, with supply and waste pipes to floor and floor flanges; and improved mixing cock and an attaching bracket to which is connected a low down supply pipe. The mixing cock is operated by urn handles, governing the supply of hot and cold water. These handles, when supply is required, are simply pulled over toward the bathtub; and the movement reversed when a cut off is desired. Dials on the



Cooper's Aluminum Roll Rim Bath.

handles denote when the supply is open or closed. The supply nozzle and waste grate are made of aluminum, the remainder of the fittings being nickel plated all over. When desired, the fixtures can be placed at the back of the bath instead of the end.

The towel rack shown in the illustration is also a recent introduction of the Cooper Company. Such articles are usually attached to the wall of the bath room, but it will be noticed that this rack is designed for attachment to the rim of the bath at any point within reach of the bather.

The fixtures represent the very latest ideas in elegance and convenience and are fully in keeping with the magnificence of the bath.

TRAPS AND VENTS.

THE DEATH of James T. Maher of Taunton, Mass., removes a successful and respected plumber from his work. He learned his trade in Fall River, but had carried on business for a quarter of a century in Taunton, where his work is found in its most notable buildings. He was a member of a number of social and business organizations and a director of the Presbrey Stove Lining Company. His plumbing business will be carried on by his brother, John Maher.

A LOCAL PAPER of Malden, Mass., says: "Much of the plumbing about the city and especially in the older houses has been found on inspection to be defective and when the sewers are completed it will be found necessary to replumb those houses and it will be ordered done by the Board of Health."

A NEW PLUMBING shop is being erected for F. J Talbot on Greenwich avenue, Greenwich, Conn.

THE BOARD OF HEALTH of North Attleboro, Mass., have appointed J. Q. Hennigan, Joseph Lovell and the chairman of the board, as a Board of Examiners of Plumbers, as required by the State law.

THE PARTNERSHIP which has existed in the plumbing business between D. Crowley and Elmer Dustin, at Leavenworth, Kan., has been dissolved. Mr. Crowley will continue the business.

A SLIGHT FIRE at Fox & Rand's plumbing establishment, at Water and Gold streets, Bridgeport, Conn., was put out with chemicals Saturday morning. The fire started from a grate.

THE HANNIBAL PLUMBING COMPANY are preparing to remove to the Hubbard Building, 814 Broadway, Hannibal, Mo.

LESTER & THROWELL are to occupy a new building being erected at San Mateo, Cal., as a plumbing establishment.

THE PARTNERSHIP of the plumbing firm of Abdon & Schoerpf, at Fort Wayne, Ind., has been dissolved. G. Abdon has opened a shop at 12 Hoffman street.

THE ANNUAL MEETING of the Stradling Plumbing & Heating Company of Utica, N. Y., was held January 19, when the following directors were elected: E. W. Stradling, E. H. Bice, E. J. Stradling, J. J. Droz, A. H. Dobson. The following officers were chosen: President, E. W. Stradling; vice-president, E. H. Bice; secretary, E. J. Stradling; treasurer, A. H. Dobson.

THE PLUMBERS' UNION of Paterson, N. J., has recommended to Mayor Braun to appoint John Campbell, one of its members, who is an experienced sanitary plumber, on the Paterson Board of Health. The recommendation was indorsed by the Passaic Tradea Assembly.

R. & J. ROBERTSON, the plumbers, have begun work on the R. R. Endicott mansion, on Broadway, Beverly, Mass.

THE PITTSBURGH BRASS COMPANY, Pittsburgh, Pa., went into the hands of a receiver on January 21, on a bill filed by a Canadian stockholder. The bill states that the company, by reason of a large increase in their business, were compelled to make extensive improvements entailing heavy expenditures. The business depression coming on, however, caused a decrease in orders; consequently payments due for the work could not be made. The application for a receiver was made in order to prevent a waste of assets, which are said to be more than twice the amount of the concern's liabilities, being estimated at $400,000, as against $175,000 debts. Joseph McNaugher of Allegheny was appointed receiver. The company are reported to be excellent shape and their obligations will be met as they fall due. A reorganization will, it is believed, soon take place.

THROUGH the kindness of Alexander Don, 187 Washington avenue, Newark, N. J., we receive the list of officers elected for the ensuing year by the Master Plumbers' Association of Newark, N. J. They are: President, Elias Berla; vice-president, Chas. E. Bond; recording secretary, Alexander Don; financial secretary, Wm. Jacobi; treasurer, Jos. A. Smith; sergeant-at-arms, E. G. Leonard; trustees, Ira Budd, Wm. Demars and T. Geiser. Mr. Don says: "Our association is getting stronger every meeting, and we expect to become members of the National Association in a very short time."

THE STATE BOARD OF PLUMBING EXAMINERS, at Denver, Col., has issued plumbing certificates to the following: First-class certificates, R. J. Cathart, J. M. Dillon, J. H. Winter, Andrew Morrison, H. M. Graves, John Wild, S. G. Smith, Charles Fullman and G. H. Darrow. Master plumbers' certificates were issued to W. P. Fraker and H. M. Luce. Certificates of the second class were issued to the following journeymen: C. E. Boltz, B. B. Kinkade, Thomas Fairhurst, A. J. Pierce, D R Jones, W. F. Davis, J. L. Webster, S. S. Wessells, G H. Halley, M. L. O'Malia, H. W. McGee, W. Heathcote, E. E. Hebert, Fred. Tost, P. J. Ralph, M. Creek, W. M. Ecker, E. B. Clayton, George Barry, James Costello, M. M. Krentz, C. B. Price and H. W. Boot.

AT THE ANNUAL MEETING of the Master Plumbers' Association of Bridgeport, Conn., the following officers were elected: Thomas Logan, president; C. S. Eames, first vice-president; George E. Scofield, second vice-president; C. S. Eames, recording secretary; L. H. Mills, treasurer; Alfred Hopkins, Henry Middlebrook and James Cook, trustees. The association will meet February 9 to complete arrangements to attend the meeting of the State association at Hartford February 15, when Zalmon Goodsell will read a paper.

C. D. RODGERS has purchased the plumbing establishment of John Dyke, of Mexico, Mo.

JAMES H DOYLE, a well known plumber of St. Paul, Minn., has opened a plumbing shop at 207 Plum street, Red Wing, Minn.

THE PLUMBING FIRM of Fallon & Barry, 1 Park street, Charlestown, Mass., has been succeeded by Joseph H. Barry, who will continue the business at the old stand.

THE SHUSTER FOUNDRY COMPANY of Philadelphia have issued to their friends in the plumbing trade a "Plumbers' Vest Pocket Health Office Register." This register fills admirably the wants of plumbers in the way of a handy record keeper of the plan numbers of work in the different wards of a city, the dates of filing of plans, of applications for inspections and of applications for final inspections. The register contains about 32 pages of heavy ledger paper, with wide blue rulings, red column rulings and printed column headings. It also contains a complete price-list of the soil pipe and fittings made at the Shuster foundry. It is bound in celluloid covers, with leather back and edges, and is of a shape and size convenient for the vest pocket. The front cover carries the title of the book and a cut of one of the Shuster Sure Seal specialties, with the name and address of the company. A similar book was issued by the concern in 1890, and judging from the appreciation it found at the hands of the plumbers the issue of 1894 will be welcomed. Comparison of the price-list in the 1890 book with that in the new edition will to an extent show the advance of the company in the sanitary fittings business and demonstrate their ability to supply anything in the way of an iron fitting or pipe.

AN ASSOCIATION OF MASTER PLUMBERS was organized at Memphis, Tenn., January 20, and the officers elected are: President, John Hopkins; vice-president, J. J. Bailey; secretary and treasurer, E. McGowan; sergeant at-arms, Martin Woods. This association is a member of the National Association.

A. S. PERCIVAL is president and J. L Phillips secretary of the recently organized association of master plumbers, at Waltham, Mass.

VICE PRESIDENT DEEDY of the Massachusetts State Association of Master Plumbers has called a meeting of the plumbers of Malden, Medford, Melrose and Everett, to be held at the Evelyn House, Malden, at 3 p.m., January 30, for the purpose of organizing a local association. This movement is largely due to the personal efforts of B. O. Tilden. On February 1 the same officer will meet the plumbers of Newton and vicinity in the Foresters' Hall, at Newton, at 2 p.m., for the same purpose. National President Daniel G Finnerty and Secretary David Smith will be present at both meetings.

THE MASTER PLUMBERS of Salem, Mass., are considering the organization of a local association and joining the National Association of Master Plumbers.

EMILE WILLSTETTER is building a one-story frame plumbing shop, 18 x 9 feet, in the rear of 288 Orange street, Newark, N. J.

THE PLUMBING FIRM of Ellithorpe, Johnson & Joyce of Niagara Falls, N. Y., has been dissolved.

NO BANQUET was served at the installation of the newly elected officers of the Master Plumbers' Association of Milwaukee, as it was decided to use the money for the benefit of the unemployed in that city. In the course of the evening the retiring president, F.

W. Pripps, made an address recounting the work of the year, the entertainment of the National Association and the wide benefits that result from it.

Peck Bros. & Co., 259 Wabash avenue, Chicago, report a general improvement in business. This is true of the city, where, however, many specifications will be held until there is a greater feeling of confidence in the money market. The surrounding country is sending in a larger number of orders and they look for a fair spring business, larger than could have been expected a month ago. There is also a steady growth in the demand for a better line of plumbing goods.

The Board of Health of Salem, Mass., at a recent meeting, elected John H. Chambers as inspector of plumbing, with a salary of $900 per year.

The Chicago Master Plumbers.

The Chicago master plumbers held a large and enthusiastic meeting at their rooms, 197 Madison street, Monday evening, January 22. President Paul Redieske occupied the chair. The reason for this great gathering was that all were interested in the success of the coming entertainment and ball, which is to take place at the Auditorium, Monday evening, February 5. The association intends to outvie its old-time glory in entertainments. For those who cannot "trip the light fantistic," literary and musical selections will be given between the dances by artists of high renown. The following committees of arrangements were appointed: Floor Committee, Thomas Conway, James H. DeViney, C. J. Herbert, M. Mandable, A. C. Hickey, W. H. Cummins, John G. Roland, Richard Finn, J. A. Voltz, Wm. Gay, Wm. T. Gary; Reception Committee, Robert Griffith, David Whiteford, A. Young, D J. Rock, E. Baggott, C. J. Boyd, J. R. Alcock, Alex. Irons, James H. Roche, J. G. Webber, T. C. Boyd.

We have received from the *American Artisan*, Chicago, the "Tinsmiths' Pattern Manual," by Joseph K. Little, C.E. This book is apparently a photo-engraved reproduction, page by page, of the first two parts of an English book by Millis entitled "Metal Plate Work." It is reproduced with no word of credit to Mr. Millis, and is even copyrighted in the name of the appropriator.

Among the novelties of a local nature at the Midwinter Fair, at San Francisco, are a miners' camp of 49 men, a gold mine, into which visitors can descend, and a Pacific deep diver and shark hunter. The exhibits of the mineral and agricultural wealth of California are said to be on a very imposing scale.

Warning is given that a considerable quantity of counterfeit money has been put in circulation recently in the Eastern States, consisting of quarter and half dollars, bearing date 1893.

A British statistician has published an elaborate series of calculations which prove that the losses to the United Kingdom, attributable directly or indirectly to the great coal strike of last year, reached by the most conservative estimates the enormous total of $155,509,832.

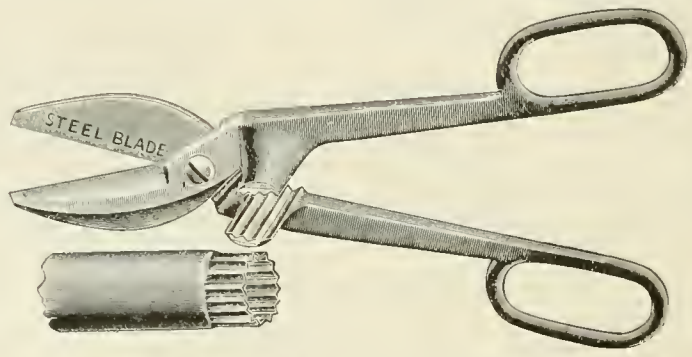
OBITUARY.

JOHN DEMING.

The death of John Deming occurred at his home in Salem, Ohio, on the 10th inst. Mr. Deming died of pneumonia after an illness of one week. He had nearly reached the age 77 years, having been born in Berlin, Conn., February 21, 1817. When about 15 years old he went to Ashtabula County, Ohio, with his parents, where they settled down. After reaching his majority Mr. Deming engaged in business with his older brother, William S. Deming, in a general store, at New Lyme, Ashtabula County. On October 25, 1849, he married Miss Angelina S. Bown, daughter of Benjamin E Bown, of Pittsburgh, with whom he was for a time associated in the wholesale and retail grocery business in that city. In 1850 Mr. Deming removed to Salem, where he engaged in farming for about six years, after which he entered the grocery business again for a period of three or four years. In 1859 Mr. Deming and his father-in-law, Mr. Bown, removed to Cincinnati, where they engaged in the manufacture of confectionery and importation of foreign fruits, nuts, &c. He continued in this business until 1864, from which time until 1868 he was identified with the pottery trade. In 1866 he bought an interest in the business of Dole & Silver, manufacturers of labor saving tools. The firm became Dole, Silver & Deming, and largely increased its facilities. Upon the death of Mr. Dole the firm name was changed to Silver & Deming, and continued under this style until 1874, when the business was incorporated under the name of the Silver & Deming Mfg. Company, with enlarged facilities and more varied output. Mr. Deming was for many years vice-president and treasurer of this company. The manufacture of pumps and hydraulic machinery was commenced in 1880. In 1890 the corporate title was changed to the Deming Company, which continued the pump and hydraulic machinery part of the business. Mr. Deming became president of the company, an office which he filled until his death. His two sons, Walter F. and William L., are also officers of the company and actively engaged in its management. In his earlier years Mr. Deming was prominently identified with the anti-slavery movement in his section and was a follower of William Lloyd Garrison, founder of the Garrisonian anti-slavery party, and for several years faithfully observed its principles in refusing to vote. He was an earnest advocate of temperance and a warm friend of the cause of education. Many tributes are paid to his worth, indicating the esteem in which he was held.

The Columbia Combined Snip and Crimper.

Below we present a new tool for tinners, invented by H. W. Smith, who gained fame previously by adding many good ideas to the trade, one of which is his steel roof, manufactured by the Canton Steel Roofing Company, Canton, Ohio. This combined snip and crimper is manufactured by Ruth, Patterson & Ruth of Alliance, Ohio, who claim it to be a practical tool for making a complete joint in metal pipe, and it will find favor among tinners generally, for it obviates the "nick" or bending the pipe out of shape, and saves the snips from being sprung, as is liable to occur when crimped by the blades in the old way. The figure represents the combined tool. The crimping device is made to the snip directly back of the pivoted blades, with three teeth tapering to the end of the crimper so as to make a gradual crimp in the pipe. Its location gives sufficient leverage for easily making a perfect crimp, it is said, in sheet metal as heavy as No 24 iron. The handles are made straigh so that the snip can be reversed and the crimper will not interfere in cutting in corners, &c. The size is No. 8 of the regular tinners' snip.



The Columbia Combined Snip and Crimper.

Barring the coldness of its climate, Vermont seems to be the place to live in these hard times. Ex Governor Stewart announces that there are no tramps, few out of employment and little or no destitution in the State up to date.

The greatest novelty in iron alloys is that with molybdenum, which metal, according to Sterrberg and Deutsch, may be readily obtained by reducing calcium molybdate with carbon. The metal, when cleared from slag by hydrochloric acid, contains from 96 to 98 per cent. of molybdenum, and can be supplied at about $1.25 per pound. The effect on steel is similar to that of tungsten; but as both the atomic weight and specific gravity are only about one half of those of the latter (W 184, sp. gr. 19; Mo. 96, sp. gr. 9), a very much smaller addition is required to obtain the special self hardening property. Steel containing 2 per cent. of molybdenum is said to be silvery white, with a fine silky fracture, and extremely hard.

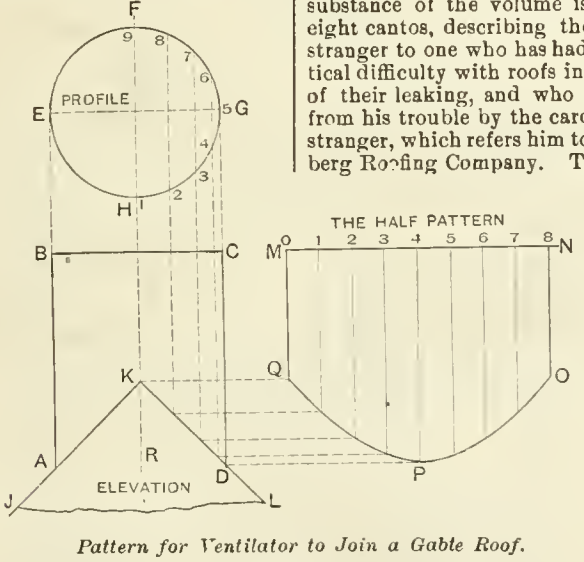
As an illustration of the growing importance of the telephone as a means of communication it is noted that the business of Louisville, Ky., was recently impeded to a serious extent by the destruction of the telephone exchange in that city, when the switch board with 3000 wires was burnt out.

ROOFING AND CORNICE.

Pattern for a Ventilator to Join a Gable Roof.

From J. H. W., *Providence, R. I.*—How is the pattern for a round ventilating pipe to be obtained, the pipe to set over the ridge of a gable roof ?

Answer.—In the accompanying diagram let A B C D represent the round pipe that is to set on the ridge of roof, as shown by J K L. In line with the sides of the pipe draw a profile, as shown by E F G H, and through the center draw F R. As the two sides of the roof, J K and K L, are of the same inclination, and as the center of the pipe is over the ridge K, both halves of the pattern



Pattern for Ventilator to Join a Gable Roof.

will be alike. Accordingly the half pattern only is shown. Then, to obtain the part of pattern shown, proceed as follows : Divide H G F of profile into any convenient number of equal parts, as indicated by the small figures. From the points thus obtained in H G F drop lines parallel with the center line R F, cutting K D of elevation. On B C extended, as M N, lay off a stretchout of H G F, through the points in which draw the usual measuring lines. Commence numbering the lines at the point where the joint is to be, in the present instance at H. Place the T-square parallel with the stretchout line M N, and, bringing it against the points in the line K D, cut the corresponding measuring lines. A line traced through these points of intersection, as shown by Q P O, will form the required part of pattern. The other half of the pattern can be obtained by a repetition of the above process, or by duplication.

THOMAS LEE GALVANIZED IRON WORKS, 79-81 Race street, Cincinnati, Ohio, report business in their line quite satisfactory, they having the sheet metal work for a number of large buildings under way and some completed awaiting the finishing up of other parts.

FLASHINGS.

A NOVEL ADVERTISING BROCHURE is published by the Kanneberg Roofing Company, Canton, Ohio. It is a neat little pamphlet of fine white paper entitled "The Stranger." The first thing that strikes the reader is the curious emblem within the front cover, looking remarkably like some old Greek coin, and only when the reader has got to the end of the book does he discover that it is merely "The Superior Steel Roofing" spelled backward, in a rather antique style of lettering. The substance of the volume is a ballad of eight cantos, describing the visit of a stranger to one who has had much practical difficulty with roofs in the matter of their leaking, and who is delivered from his trouble by the card left by the stranger, which refers him to the Kanneberg Roofing Company. The drawings are excellently done, and show the advance from distress to resignation, then interest, and finally great content, as the possibility of a tight roof is realized. In addition the Kanneberg Roofing Company also supply eave troughs, conductor pipes, ar anything in that line.

THE FIRM of Caswell & Moore, Phœnixville, Pa., will place the roof on the Citizens' Traction Company's new power house, located on Beech street, Philadelphia. The roof, which is a large one, will be constructed of corrugated iron.

THE D. K. MARTIN ROOFING & MFG. COMPANY of New York City have been incorporated, with a capital of $100,000. The directors are: D. K. Martin and E. T. Dehan of New York, and J. L Goodenough of Whitestone, L I.

THE MCDANIEL & HARVEY COMPANY of Philadelphia, sheet iron manufacturers, have recently installed a complete modern plant for making painted and corrugated iron sheets, curved sheets and standing seam and roll and cap roofing. The plates will be rolled in their own mills and the manufacture completed in their own works. They will continue to make galvanized steel sheets and their "genuine old fashioned charcoal bloom galvanized iron sheets," Eagle brand.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until February 14 for the wood roof, sheathing, slate and copper work of roofs, the steel, iron and slate and copper work on dormers, down and drain pipes. &c., on the United States Post Office and Court House Building, at Detroit, Mich. Drawings and specifications can be had at the office of the Supervising Architect, Washington, or from the superintendent at Detroit.

THE NINTH ANNUAL MEETING of the Metallic Roofing Company of Toronto, Limited, was held at the head office in Toronto, Ontario, on the 15th inst., when E. Samuel was re-elected president, A. D. Benjamin vice president, and J. O Thorn secretary and treasurer.

Unemployed Workmen.

The advantage, during such hard times as those with which the United States and England have recently been visited, of being a skilled workman, is well brought out in the following remarks by "Vulcan" in the London *Ironmonger:* We hear a good deal about the unemployed just now, but it seems an equally common experience that competent mechanics are exceedingly scarce. It must be, I suppose, although some deny it, that the unskilled workers form the vast majority of that class to which public attention is directed. In a Western town not long since an ironmonger advertised for a light porter, and before 10 o'clock in the morning scores of applicants presented themselves. A few weeks later the same firm advertised for a mechanic, and offered the full standard wage; but, although the announcement appeared in several papers, and in some of them more than once, yet only three applications were received in all It is to be hoped that the present generation of parents will be more alive to the importance of having their boys taught a trade than their immediate forefathers were.

At a meeting of the Executive Committee of the Brass Workers' National Trade Assembly, held in New York on January 21, it was reported that the trade generally was in excellent condition, and that every member of the assembly had enough and to spare for his family. The number of local unions was reported to be increasing.

While the year 1892 was one of disturbance and disaster in so many countries, it appears to have smiled on Ireland. The London *Times* says that last year was one of the most peaceful and prosperous of the century in the Emerald Isle. Since 1826 there has been no better agricultural season, and the people have never been freer from distress.

STEAM AND HOT WATER.

Horse-Power and Heating Capacity.

From W. A. C., *Paterson, N. J.*—Will *The Metal Worker* please give me some information on the following subject: What horse-power horizontal tubular boiler will be required to heat a school house which has 10,000 feet of radiating surface in coils? How many feet will a one horse-power boiler heat? Please let me know how to find the horse-power of a horizontal tubular boiler?

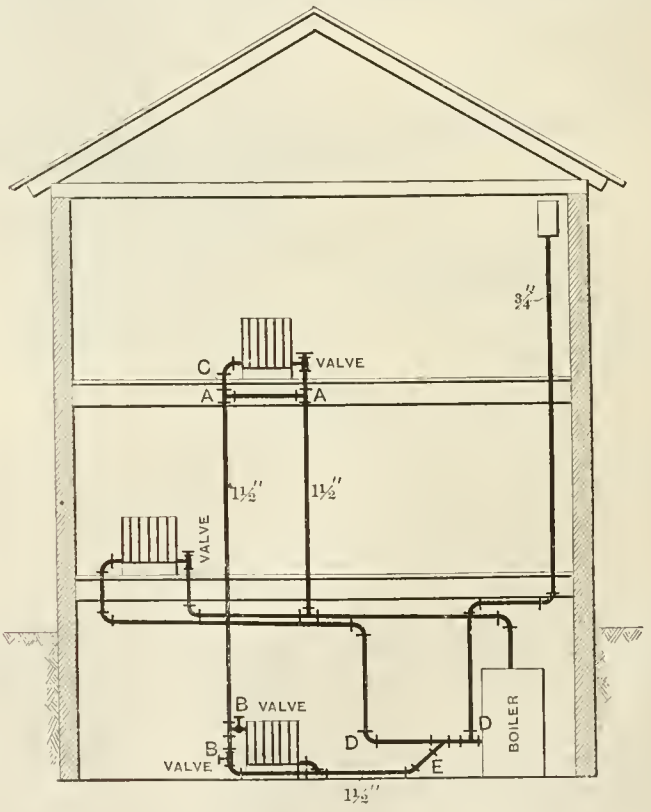
Answer.—In the Letter Box of October 14 our correspondent will find some information on the same subject. Authorities vary in stating the horse-power of heating boilers, but an average of the different authorities gives 16 feet of boiler surface as equal to one horse-power when used as a heating boiler. These same authorities vary equally in giving the amount of radiating surface that one foot of boiler surface will supply, but a conservative number is about five feet. By dividing 10,000 feet of coil surface by 5 our correspondent will find that he will require 2000 feet of boiler surface, and by dividing the 2000 feet by 16, he will find that a 125 horse-power boiler will be required to heat the building. Assuming that there are 16 feet of surface to a horse-power and each foot of surface in the boiler will heat five feet of radiating surface, a one horse power boiler would heat 80 feet of radiating surface, but this is probably incorrect for a single horse-power boiler, but intended for use as a rule where the boiler has several horse-power.

Radiator on Boiler Level.

From A. C. EDGAR, *Philadelphia.*—Different methods are used by different men for connecting radiators on the same level as the boiler in a hot water heating system. Some advocate the independent flow main to supply such radiators; others claim the syphon can be used with better results, while one ventures to recommend an opening from flow main direct to top of radiator. It is true that each of the above methods can be used with success, but it cannot be said that all will give satisfaction under all conditions. When the independent flow main is used the outlet should be taken direct from the boiler. This is not always convenient when the radiators to be supplied are any great distance from the boiler, and when finished partitions are encountered requires extra cutting. The syphon also requires extra cutting, and when exposed in parlors or sitting rooms is no ornament. Supplying the radiator direct from the flow main gives very poor satisfaction, and if taken from the main near an outlet for riser to floors above, will not circulate properly, although the radiator may become partially warm from conduction or local circulation.

The accompanying sketch shows a method of connecting radiators on the same level as boiler that has been used with good results. The radiator above should always be tapped one size larger than for ordinary connections. Under the floor at A A connect flow and return, forming a syphon. Valves B B are connected in by-pass at lower radiator, which allows either radiator to be operated without interfering with the other. This method embraces the best features of the syphon without requiring any extra rising lines or air pipe, as well as overcoming the objectionable feature of supplying the lower radiator with the return from the upper one in the ordinary way. The flow and return risers, being larger than usual, deliver more hot water than the upper radiator requires, thus promoting the circulation in the lower radiator and maintaining almost the same temperature in both. It is not advisable to reduce the run of the tee under the floor, for when the upper radiator is in use, the water not allowed to pass through it, being warmer, will retard the circulation when it comes in contact with the return at C.

While there are many methods of connecting radiators on the same level as the boiler, some give better results than others. When the above method is properly connected it will always give good results. The flow connection is not all that is necessary to induce circulation; it is very important that the return connection be made at the proper place. The lower radiator will not circulate properly if the return from it is connected into the bottom of a tee that is bullheaded to the boiler, nor is it proper to connect the return into the outlet of a tee on the horizontal main return. When a Y is connected between points D D, as shown at E, the circulation in main return will assist the lower one.



Radiator on Boiler Level.

HEATING NOTES.

BELKNAP MFG. COMPANY, Bridgeport, Conn., manufacturers of steam fitters' supplies, have recently added to their plant, put in new machinery and taken advantage of the dull season to overhaul the entire factory in preparation for the spring trade. The changes are in the direction of economical production and greater capacity all around.

BROOMELL, SCHMIDT & CO., LIMITED, York, Pa., have opened a branch in Philadelphia, with office and wareroom at 146 North Third street. Fred. Ruof, who has had much experience in the heating line, will be manager, and A. P. Broomell of the firm will also be at the Philadelphia office a good deal of the time. The firm will do a general contracting business in steam and hot water heating, steam fitting, &c., and will carry in stock a line of Our Own radiators, Keystone boilers, horizontal tubular boilers, steam pumps, steam traps and other specialties. The Heat-

encook range will also be handled and pushed on the Philadelphia market. The store and office will be heated from one of these ranges, which will be set up and operated.

THE STOCKHOLDERS of the American Boiler Company held their annual meeting at the offices in Chicago on the 17th inst. The following directors were elected for the ensuing year: William K. Pierce, Henry T. Richardson, George E. Downe, A P. Richardson, M. T. Pierce and C. V. Kellogg. At a subsequent meeting of the directors the following officers were elected: President, William K. Pierce; vice-president. Henry T. Richardson; secretary, A. P. Richardson; treasurer, C. V. Kellogg. It will be seen that George S. Downe has retired from the vice-presidency. Henry S. Downe remains with the company as salesman, having his headquarters in Chicago. A report has been in circulation for some little time that at this meeting steps would be taken to dissolve the company, but we are advised by the officers that no such action occurred or was contemplated. All interests continue, and the policy of the company will be the same as heretofore. The management of branch offices, as far as known, will remain in the same hands.

VICE PRESIDENT A. T. HENDERSON and Treasurer H. A. Smith have purchased all the capital stock of the United States Heater Company, and will issue $25,000, additional stock, which has been subscribed for. The office of the company, at 113 Randolph street, Detroit, will be continued, and an office will be maintained in Chicago for the transaction of business connected with the territory west of Chicago. The company have secured the showroom at 100 Lake street occupied by John W. Mills, who is to discontinue the contracting department of the business, and will be connected with the management of the United States Heater Company, assisted by D. E. McCabe. Arrangements are being made by the company for the manufacture of larger sizes of the Capital and Hecla heaters, also for a line of small boilers for steam and hot water. These new sizes of heaters and boilers are expected to be on the market during March or April.

WE ARE INDEBTED to Secretary Reynolds of the Master Steam and Hot Water Fitters' Association of the United States, with office at 625 Metropolitan Life Building, Madison avenue and Twenty-third street, New York, for a neat little pamphlet containing the constitution and by-laws of the Master Steam and Hot Water Fitters' Association of the United States. The list of officers since the inauguration of the association, in 1889, up to the present time is also printed.

AT THE ANNUAL MEETING of the Kewanee Boiler Company, Kewanee, Ill., the following directors were elected: E. E. Baker, Horton Vail, J. P. Dugger, B. F. Baker, August Wagner and T. P. Pierce. The directors then chose officers as follows: President, E. E. Baker, vice-president, Horton Vail; secretary, J. P. Dugger; treasurer, B. F. Baker.

A CIRCULAR ISSUED by H. Andres, 403 Market street, Philadelphia, Pa., the Eastern agent for the Ware Automatic Heat Generator & Regulator Company of Chicago, Ill., presents a broken view of the Ware heat generator with explanatory text showing its operation. The apparatus is furthermore described in the inner pages of the circular and attention is likewise directed to the Ware automatic fuel controller.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

THE PROPERTY COMMITTEE of the Lancaster School Board recently adopted for the new school building at East Chestnut and Franklin streets, Lancaster, Pa., the Fuller & Warren heating and ventilating system.

THE CONTRACT for the plumbing of the new Young Men's Christian Association Building, at McKeesport, Pa., has been awarded to R. B. Beane of Walnut street. The price is said to be about $900.

A NEW SYSTEM OF VENTILATION is to be provided in the city hospital at Cincinnati. It is to be an exhaust fan system and bids will soon be asked for the fans and air ducts and the remodeling of the heating plant to conform to the new requirements. It is expected that the expense will reach $5000.

YARRINGTON & MCCABE, Birmingham, Conn., have secured the contract for the plumbing on Perry's new tenement house in Shelton.

THE CONTRACT for the plumbing in Swarthmore Hall Building, at Swarthmore, Pa., has been awarded to Manning Bros. of Morton, Pa.

WILLIAM A. HECKMAN, plumber, 18 North Eighth street, Reading, Pa., received the contract for the plumbing work at the new Felix Seminary in Muhlenberg township. The water supply will be from two tanks on the third floor, each holding 1000 gallons of water, which are kept filled by a hot air pump. Mr. Heckman will also install a heating plant on the Mercer hot water heating system.

WM. WENZEL, Appleton, Wis., has been awarded the contract for plumbing in Geo. Danielson's store in Neenah, also in the Kimberly Clark Co.'s offices.

J. F. STEPHENSON, Lakewood, N. J., has recently completed the installation of a hot water heating plant, using a Novelty Circulator, in the Lakewood residence of S. B. Ferris of Newark, and a combination plant of hot air and hot water, using six registers and 13 radiators, in a house to be occupied by Geo. J. Gould of New York, using an Ideal Novelty furnace.

THE LAWRENCE PLUMBING & HEATING COMPANY, Lawrence, Kan., have the contract for the plumbing in the new University library, amounting to about $1100.

THE COMMON SENSE HEATING & VENTILATING COMPANY were awarded the contract for heating and ventilating the new hospital at Dallas, Texas.

DELL CROSS is doing the plumbing at the European Hotel, Renovo, Pa Bathtubs, water closets, &c., are among the improvements to be installed.

PROPOSALS are asked for the plumbing for the Plain street school, at Clinton, Mass.

SHAW, KENDALL & Co. of Toledo, Ohio, have been awarded the contract for installing the heating plant in the new National Union building on Huron street of that city. The Plenum system will be used and the air will be drawn from a point higher than the building into the large fans which will drive the air over steam heated pipes through a series of air passages into all the rooms in the building. The auditorium in the building will be heated by warm air issuing from over 200 small openings directly beneath the chairs. The fans are to be operated in summer to bring in fresh air and cool the building.

R. & J. ROBERTSON, Beverly, Mass., are doing the plumbing and hot water heating of Dr. G. A. Webber's residence at Manchester, Mass. In this house they will use a 304 Gurney hot water boiler and 12 radiators. They have taken the agency for the Gurney hot water heaters.

P. J. SWEENEY & Co. of Lawrence, Mass., have been awarded the contract for the steam and water pipe fitting of the Consumers' Brewing Company's large new building at Lowell.

THE WALCOTT-HURLBUT COMPANY, 175–177 Lake street, Chicago, have received an order from the school board at La Salle, Ill., for four "eduction" closet ranges, comprising 28 sections in all.

B. J. BUSH, Chicago, intends building a three story apartment house, 42 x 72 feet, to cost $12,000, that will be heated by steam.

THE CONTRACT for plumbing the opera house, at Faribault, Minn., has been let to Clefton Bros. & Conner of Minneapolis.

British Tin Plate Works.

The following extract from a recent issue of the *Mechanical World* of Manchester, England, affords some information in regard to British tin plate works, which is of interest: From a recent official report it appears that there are at the present time 96 tin plate works in England and Wales, with a total of 519 mills. These produce, on an average of recent years, some 450,000 tons of tin plates per annum, so that the average output per mill is nearly 5000 tons. But as there is always a certain proportion of the mills out of work, and as many others are on slack time, there must be a much larger production than this possible to the best mills that are regularly employed. The principal center of the tin plate trade is Swansea, where there are 51 different works, with a total of 276 mills. Swansea is also the chief tin plate exporting center in the kingdom. Between 1877 and 1892 the exports of tin plate from that port advanced from about 11,000 to 252,000 tons. It is estimated that there are altogether 140 works, of 36 different descriptions, within a radius of 4 miles of Swansea harbor, and that these various works employ a total of some 30,000 people. It may be added that the Harbor Commissioners of Swansea propose to expend a considerable sum of money in providing additional dock and harbor facilities, and although trade prospects are just now not of the brightest, it is likely that the suggested improvement will be carried out shortly, in anticipation of the long looked for revival of activity.

A Southern industrial journal announces the discovery of a rich vein of tin ore at a depth of 10 feet below ground, at King's Mountain, N. C.

An important find of good coal is reported in Mendocino County, Cal., where mines are about to be developed.

THE RETAIL STORE.

Retail Dealers' Convention.

A meeting of the stove dealers of Oswego County was held at Central Square, New York, on Saturday, January 13, for the purpose of discussing questions of interest pertaining to the stove and hardware trades. The originator of the movement was Dayton R. Fritts, a dealer in stoves and hardware at Parish, N. Y. As a result of this meeting, a permanent organization of stove dealers was formed, with George Elliot of Central Square, president, and George Douglas of Pulaski, secretary. A committee was appointed to draft by-laws and consider other matters of importance in this connection. We understand that the association is to meet twice a year at some convenient point in the county, and that more permanent arrangements are likely to be made at the next meeting. After the business in question had been transacted the meeting adjourned, subject to the call of the president. Among those present may be mentioned the following: J. P. Ford, Lacona; L. J. Macy, George Douglas, Pulaski; Dayton R. Fritts, Parish; George Elliot, P. L. Lane, Central Square; N. A. Hughes, Phœnix; A. J. Wright, George Johnson, Mr. Loomis of Loomis & Wilson, Fulton; Mr. Penfield of Quigg & Penfield, Mr. Dowd of Oswego Hardware Company, Oswego; Ed. Stone of B. S. Stone & Co., Mexico, and F. Jennings, Sand Bank.

Enterprise Coffee, Spice and Drug Mill.

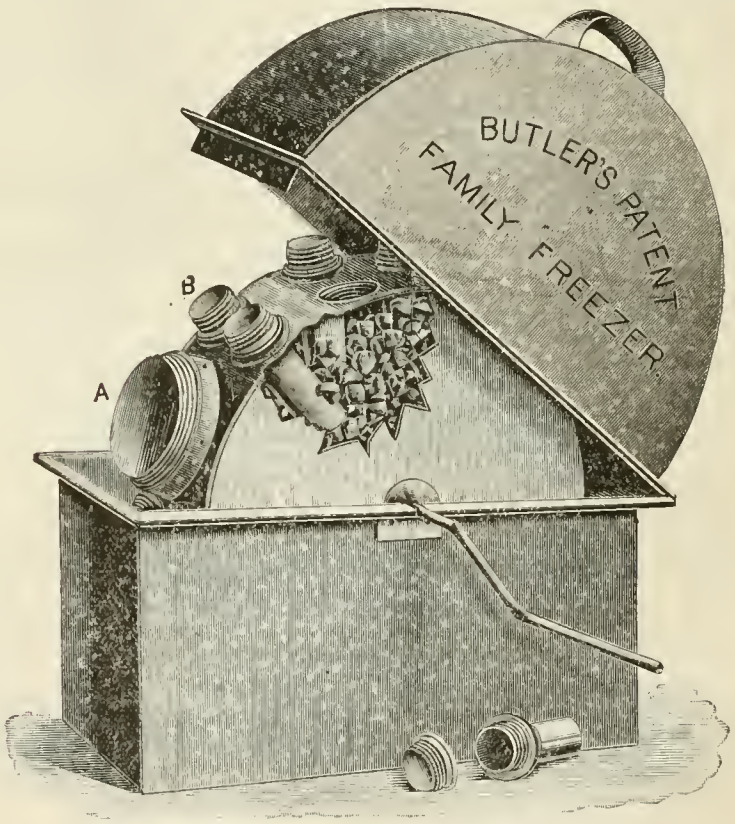
The Enterprise Mfg. Company, Philadelphia, Pa., are introducing the mill here shown. It is 16⅝ inches long, cup included, 7½ inches wide, 6⅞ inches deep, and weighs, complete, 17 pounds. It is designed to attach to a post or

Enterprise Coffee, Spice and Drug Mill.

wall and is readily detached when desired. The mill is designed to meet the demand for a mill of large size for use in hotels, lumber camps, boarding houses, on steamboats and for other places where economy in space is requisite. The makers state that for power and speed, the degree of fineness of grinding being the same, it is equal to their No. 5 mill, but, should finer grinding be desired, that it equals in all respects their pulverizers from Nos. 00 to 4 inclusive. The mill is handsomely japanned, ornamental in appearance and will be known as No. 350.

Family Ice Cream Freezer.

T. G. Ellsworth, 85 Chambers street, as sales agent, is introducing the Butler-Kattenhorn & Ellsworth family ice cream freezer, as illustrated herewith. The freezer is constructed entirely of metal, the outside case and cover being of galvanized iron. The revolving drum is provided with holes having threaded



Family Ice Cream Freezer.

flanges, which project into the drum and form sockets, into which the threaded portions of the cream cups B fit. The cups are provided with covers, so as to hermetically seal them, preventing the brine from coming in contact with the cream. A cup and cover is shown outside the case, near the bottom of the cut. The cups, as regularly made, are designed to hold a suitable quantity of cream to serve to an individual, or they may be made any desired size. The freezer shown contains 22 cream cups, arranged in such a way, it is stated, as to be readily placed in the drum or removed from it. For filling the drum the cap A is removed and the drum is filled with ice and salt, and the cap screwed back again to its water tight position. A pulley is placed upon the larger machines when power is required to drive them. The freezer is designed for freezing individual creams, ices, custards, &c., and the point is made that as many different kinds may be frozen at once as there are cream cups, or that all the cups may be used for one kind.

The E. S. Farson Mfg. Company of Philadelphia have issued their annual catalogue of Farson refrigerators and water coolers. In the line of improvement they have introduced overlapping doors on all their styles of refrigerators; also improved surface locks and sliding doors for covering concealed spigots. All zinc linings in their goods are turned under, thus leaving no rough projections. As a novelty for this season they illustrate the Farson hardwood buffet refrigerator, made in walnut or oak. This article is claimed to be especially suitable for clubrooms and dining rooms, combining as it does both refrigerator and sideboard, and rendering a separate sideboard entirely unnecessary. The tank is porcelain lined, and has a capacity for 72 pounds of ice. There are two large compartments in the refrigerator, and a small one 6½ inches high and 20 inches wide, the latter situated directly below the tank and separate from the other compartments. The water spigot is ingeniously concealed, and there is no drip pipe. In design the refrigerator is handsome, and when closed has the appearance of an ordinary buffet.

Delivery of Goods.

BY H. P. KING.

A system for delivering goods, like other branches of the business, must necessarily vary with the volume of trade and the population of the city. The following suggestions are based on the supposition of a city having from 70,000 to 80,000 inhabitants, a retail store catering to household as well as builders' trade, and the employment of one delivery wagon which is never called into the service of the shipping clerk.

A COMPLETE LIST.

The first requisite in the disposition of goods sold, is to make a complete list, showing every article which the purchaser has selected and the quantities of each. After the list is called back and checked, the goods that can be wrapped and tied in packages should be cared for at once, to avoid all possibility of being mislaid by casual and careless passers by.

MARKING PACKAGES.

For marking packages a gummed tag is the surest method of avoiding errors in delivery; for bulky goods a string tag or paint, as the case may require. If but one package or article is to be delivered, mark name and address on the tag, but if packages are numerous, mark name only on all tags except one and on that one the name, address, number of packages and list of articles not wrapped.

A CHECK ON THE SALESMAN.

By the enumeration of packages and articles in the duplicate receipt book of the delivery wagon the driver has a check on the salesman and can be reasonably sure of starting right at least. As to the disposition of goods awaiting delivery a counter or floor space devoted to this sole purpose is very necessary. Where it is not practicable to gather all the goods in one space the delivery clerk can ascertain from the before mentioned tag just what goods are to be delivered and go to the different floors or rooms to find them.

DELIVERY WAGON.

The most effective and satisfactory use of the delivery wagon is found in the division of the city into districts and making a trip to each district at stated hours. By this system, if adhered to, a customer can be given definite information as to the time the goods will be received. In case of immediate delivery being required various methods may be followed, according to the circumstances. If the goods are in a small, light package, the office boy or messenger service can be utilized; if goods are bulky then an expressman must be hired and the expense charged to the customer or not—according to the discretion of the salesman. Under no circumstances should the hours and trips of the delivery wagon be interfered with.

DUPLICATE RECEIPT.

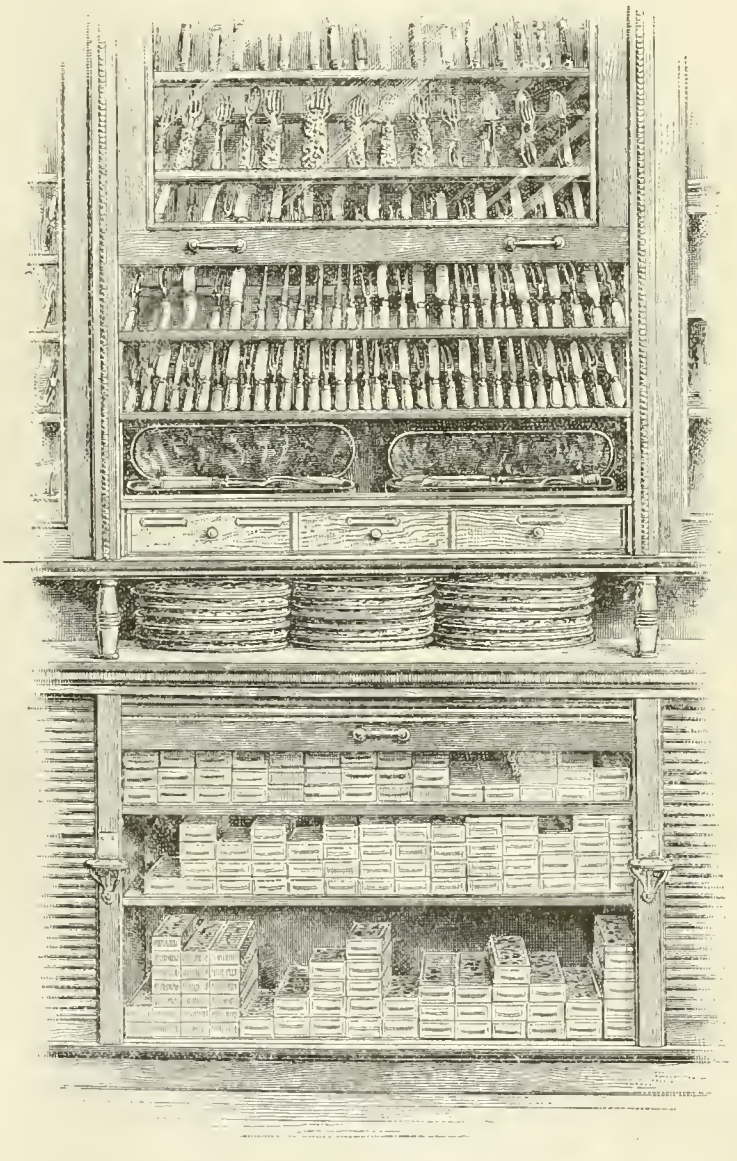
The goods having reached their destination the duplicate receipt is given with them, and the book signed after a careful counting by the party to whom they are delivered. No inspection of packages is practicable, for too much time is consumed and the error in the contents, if any, can only be rectified at the store, and the delivery clerk has his time schedule to keep up.

COMPLAINTS OF SHORTAGE.

Instances are very numerous of contractors making complaints of shortage in goods delivered to unfinished buildings, and such cases seem to afford the largest opportunity for errors. The surest method to pursue under such circumstances is to mark on each package its contents and designate the floor or room for which it is intended, and then call for the foreman of the work to check them before signing receipt. For any error in the contents of the packages the salesman is, of course, directly responsible, and he should send out no bill of Hardware that is not first looked over and checked back by somebody who is acquainted with the goods.

An Interesting Section of Shelving

The accompanying illustration represents a section of shelving, a line of which extends along a portion of one side of the retail department of Dame, Stoddard & Kendall, 374 Washington street, Boston, Mass. This shelving has replaced some of less modern construction, and was especially designed for convenience and for the more satisfactory display of the goods. The space under the ledge is fitted with fronts similar to roll top desks, which slide upward and back, protecting the goods from dirt and dust, and being entirely out of the way when opened. The cupboards under the ledge are devoted to duplicate stock in full packages. Metal steps fastened to the uprights enable the salesman readily to reach the higher goods in the cases above. Immediately above the ledge is an open space for miscellaneous goods, which is utilized for keeping fancy wood bread plates. The cases above are provided with plate glass sash hung with weights, which when raised slide above the cornice at the top. Three drawers in the section contain such goods as are too small to exhibit on the racks above. The drawers are equal in hight to the lower rail of the sash, and are consequently obscured from view when the sash is down. The racks on which the goods are sampled each consist of two strips of wood, one at the front and the other near the back of the case, placed at unequal hights. The front strip is a round piece with a groove at the back sufficient to allow the handles of the goods to rest in it. The back piece is not grooved, but the blades or tangs rest on the top, making the goods plainly visible to customers. The section to the right of the one shown is shelved, alternate shelves being cut in to permit of displaying sets of Carvers and other goods in cases, with the covers raised. Other sections are arranged with special reference to the goods for which they are designed. The cases are handsomely finished and trimmed and present an elegant appearance.



An Interesting Section of Shelving.

STOVE TRADE NOTES.

Cupola Management*—I.

BY DR. EDWARD KIRK.

The peculiarities in the working of every cupola must be learned before it can be run successfully, and they can only be learned by working it in different ways. It is a question very much disputed whether a cupola constructed upon the latest improved or patented design is superior to one of the old style. This question can only be decided by the intelligent working of each cupola and the advantage will always be found in favor of the one that is properly worked, no matter what its construction. It is the duty of every foundryman to give his personal attention to the working of his cupola if he has time. If he is not a practical founder or has not the time to devote to this branch of the business that it requires, then he should have his foundry foreman give it his personal attention for a sufficient length of time each day to see that everything is right in and about the cupola.

No cupola can be run successfully by any given rule or set of rules, for conditions arise to which the rules do not apply. I shall therefore not only give directions for the proper working of a cupola at every point, but shall also give the results or effect of bad working at every point, so that the founder when he finds his cupola is not operating well may have some data from which to draw conclusions and be able to overcome the difficulty.

Drying the Lining.

The cupola having been newly lined, nothing is to be done to the lining for the first heat but to dry it. A very high or prolonged heat is not required for this when only one thickness of brick is put in and laid up in thin grout. The lining may be dried by making a wood fire after the sand bottom is put in, or by starting the fire for the heat a little sooner than usual. But the fire must not be started too early or the bed will be burned too much and the cupola filled with ashes, which will retard the melting.

When a backing or filling of wet clay or sand several inches thick is put in between the casing and lining, more time and care are required in drying. It must then be dried slowly and evenly, or the filling will crack, and when jarred in chipping out will crumble and work out through cracks in the lining or holes in the casing and leave cavities behind the lining. When a lining is put in in this way, the doors are put up and covered with sand and a good coal or coke fire is made in the cupola and allowed to remain in over night. In the morning the bottom is dropped to remove the ashes and cool off the lining before making up the sand bottom for a heat.

Putting up the Doors.

The first thing to be done when making up the cupola for a heat is to put up the bottom doors. When the cupola is of small diameter and the door light it may be raised into place and supported by one man. But when the door is heavy two men are required, and if the cupola is a large one and the door made in two parts, three men are required to lift and support them. Two men get inside the cupola and raise one-half into place while the third man supports it with a temporary prop; they then raise the other half as far as it can be raised with their bodies between the two doors, where it is supported by a temporary prop. The men then get under the door on their hands and knees and raise it into place on their backs, where it is supported by a prop.

Numerous devices have been arranged for raising the doors into place, but they soon get out of order from the heat of the dump or carelessness in manipulation and they have almost all been abandoned. When the cupola is very small and the door light it is sometimes supported by an iron bolt attached to the under side of the bottom plate at the front, where it can be readily withdrawn with an iron hook to drop the bottom. But the doors are generally supported by a stout iron prop or post placed under the door near the edge opposite the hinges. Double doors are supported by a stout iron prop in the center and generally a light one at each end of the doors to prevent them springing when charging the fuel and iron, or by a sudden settling of the stock, as may occur when melting large chunks. A great many melters have no permanent foundation under the cupola upon which to place the main prop, but make one every heat by laying down a small plate upon the sand and setting the prop upon it. The plate is often placed too high or too low, making the prop too long or too short, and the plate must be raised by putting a little more sand under it or lowered by scraping away a little sand. While this is being done the heavy iron prop, which frequently requires two men to handle in the cramped position in which they are placed under the cupola, has often to be put up and taken down two or three times before it is got in the right position to support the doors.

All this extra labor can be avoided and time saved by imbedding a heavy cast iron block in the floor or foundation under the cupola for the prop to rest upon. It must extend down a sufficient distance to insure its not being disturbed when shoveling out the dump. A block 6 inches square and 10 inches long, placed with the end level with the floor, will seldom be displaced, and makes a sure foundation for the prop. The size of prop required to support a bottom depends upon the size of cupola. In small cupolas the stock is supported to a large extent by pressure against the lining, while in large cupolas the stock is supported almost entirely by the prop. For small cupolas the props are made from 1½ to 2 inches diameter, and for large cupolas from 3 to 3½ inches diameter.

The props for large cupolas not only have a greater weight to support, but they are seldom pulled out of the dump and are therefore if light liable to be bent and twisted to such an extent as to render them useless. For this reason they are often made heavier than is actually necessary for the support of the bottom. Quite a number of foundrymen have adopted the plan of attaching a ring to the prop near the top or bottom with which to draw it from the dump and avoid heating it. The ring is made large and hangs loosely, or as a long loop which stands out from the prop. When the prop is to be removed a hook is placed in the ring or loop and a quick jerk given, which releases it, and it is at once drawn from under the cupola.

Some of the old melters never use the iron prop, but measure and cut a new wood prop for their cupola every heat. Many of them are so superatitious that they think the cupola would not melt without the new prop and they would rather give up their job than try it. Such melters are not so plentiful now as they were 20 years ago, when I first began traveling as a melter through this country and Canada, but I find when visiting foundries there are still a few of them left.

Dropping the Doors.

When it is desired to drop the doors it is done by removing the props or drawing the bolt. The small props are first taken out, being released by a stroke of the hammer, and are carefully laid away so they will not be bent by the heat of the dump. A long bar with a handle on one end and a large hook on the other is then placed under the cupola with the hook behind the main prop and about 10 or 12 inches from it. By a sudden jerk of the bar the hook is made to strike the bottom of the prop a sufficiently hard blow to knock it out of place and permit the door or doors to drop. Two or more blows of the bar are sometimes necessary to release the prop, but it can always be released in this way. The prop can also be released by striking it at the top with a straight bar, but it is oftener missed than hit, and many thrusts are sometimes required to bring it down. Bolts are only used on small cupolas from which the dump falls slowly and the bolt can generally be withdrawn by a blow of the hammer without danger to the melter. If it cannot be withdrawn in this way without danger of burning the melter, a hook is made on the end of the bolt or a ring placed in it so that it may be drawn with a hooked bar or struck with a long straight bar.

*Copyrighted, 1894, by Edward Kirk.

THE FOLLOWING are the names of the directors of the Lebanon Stove Works, Lebanon, Pa., chosen at a recent meeting of the stockholders: H. H. Kreider, F. Meily, A. S. Light, J. H. Seltzer, D. W. Zeller and H. A. Reinoehl. At a subsequent meeting the Board of Directors elected H. H. Kreider president, A. S. Light secretary, J. H. Seltzer treasurer, and J. M. Reilley manager. The company recently resumed operations, and have been running full time on orders which, Manager Reilley states, will keep them busy

until June 1. A new plating department is to be added to the plant and hereafter the nickeling, which has been done by outside parties, will be performed under their own roof.

A Commendable Movement.

In our issue for last week we called attention to the fact that the Buck's Stove & Range Company of St. Louis, Mo., had arranged to resume operations for a period of 60 days with a force of 350 men. According to the notice sent out by the company there is to be no reduction in wages for the present, but the starting of the foundry is more to give the hands midwinter employment than to meet the demands of the company's business. This movement is regarded as practically a solution of the question how to provide for those at present unemployed. Manager J. W. Van Cleave of the company figures out that in 60 days they will distribute $25,000 in wages, and thus tide over the 350 families dependent upon their men until March. The interest on the $25,000 until such time as the goods can be sold is figured at $500, which may be regarded as the company's donation to charity. Mr. Van Cleave says that it is much better to open the foundry during the months of January and February, even if it is necessary to close again in summer. If business picks up later on and there is no necessity for closing the workmen are that much better off. It requires no argument, he says, to prove that 60 days' employment at this time carries with it more real benefits and comforts than 60 days in the summer, when living is cheaper and the opportunity for open air employment many fold greater than in the winter. The plan of the company is certainly one to be commended, as money donated in this way goes much further in relieving the requirements of the deserving than an equal amount given outright. There is no question that if imitated when feasible by other concerns which are closed down much good would result and the scheme prove to be the means of dispensing charity far more satisfactorily than any yet devised.

Stove Trade Reminiscences.

BY JEEMS

Regarding what Old Mack says about "Ould Tim" in your edition of the 13th. Tim says he worked for Cunningham & Wilson, at 233 or 235 Water street, in 1831. He does not remember the number, but it is one of those small stores where the Repair Association is located. The Jim Cunningham Mack speaks of was a boy there then. He kept on Water street and afterward on Grand street. I regret to say Tim will soon be of the past. He was struck down by paralysis while at the bench and no hope is entertained of his recovery. The allusion to Tim's fondness for the past was not made to hurt any one's feelings, because the past must always have an interest for us all. But the rapidity with which changes take place at the present time renders it almost impossible to the progressive man to dwell too much upon "what we used to do," &c. We did, but we don't do it now, but what we will do no feller can tell. But if you want to keep up with the advance you will have to unload lots of the past or you will sink under the burden. When you get religion you have got to be born again, so the parson says, and I imagine if you want to keep up with the newness of the new and the whichness of the thus, you will want to be born new about every week, judging by the way things are working. They are putting up lots of immense office buildings in New York, fitted up in regal style. The question is asked, where are the people coming from to occupy them, and what kind of business they can do? "Can't keep shops, you know, or store goods, and it costs money to run an office and live in New York." There isn't much guide in the past of what is going to be done, but the future will tell.

ODD PLATES.

F. M. Borden of F. M. Borden & Bro., 118-122 North Second street, Philadelphia, is making a business and pleasure trip through Florida accompanied by his wife. Splendid Novelty and New Process gasoline stoves and Challenge Iceberg refrigerators will not be the only theme of his conversation, and the dealers of the State who miss his call will lose the pleasure of entertaining a genial visitor.

The plant of the Littlefield Stove Company, at Albany, N. Y., opened Monday, January 22, and about 125 employees are now at work.

The Albany Facing Mill Company of Albany, N. Y., have been incorporated with a capital stock of $10,000 to manufacture foundry facings and foundry supplies.

At the annual meeting of the stockholders of the Bellaire Stove Foundry Company, Bellaire, Ohio, the old Board of Directors were re-elected, with the exception of E. C. Boyd, who was succeeded by J. B. Montgomery. The board organized by electing H. Roemer president and treasurer, E. H. Rider secretary, and Robert Johnson manager.

At the recent annual meeting of the stockholders of the Woolridge Stove Company of Memphis, Tenn., the following directors were elected: G. W. Macrae, J C. Neely, E G Robinson, T. J. Latham, Lawrence Simpson, John Overton, Jr, and G. M. Brasfield. The board then organized by the election of G. M. Brasfield as president, T. J. Latham, vice-president; W. H. Woolridge, superintendent; George S. Fox, secretary and treasurer.

The Portland Stove Foundry Company of Portland, Maine, resumed operations last week on full time, giving employment to 60 men.

A heater using gas made from kerosene oil as a fuel has recently been exhibited in Meriden, Conn., by L. H. Curtis, who is a large stockholder in the Rock Oil Fuel Oil Company, which we understand is to be reorganized. It is claimed that no odor or smoke is emitted from the stove and the consumption of oil is small.

J. J. Tonkin has recently become interested in the tubular hot air furnace invented by W. A. Kitts of Oswego, N. Y., and its manufacture is to be undertaken on an extensive scale. We understand that the furnace has given very satisfactory results in operation during the past winter in Oswego, demonstrating the fact that it is easily cared for and can be operated with an economical consumption of fuel.

According to a press dispatch from Reading, Pa., the entire plant of the Mount Penu Stove Works of that city, which has been idle for four weeks, resumed operations on January 23, giving employment to 200 persons.

We have received from the Baxter Stove Company, Mansfield, Ohio, a copy of their illustrated "D" catalogue relating to Monarch stoves and ranges for gas and gasoline. The 64 pages of which the volume is composed are beautifully printed in two colors upon tinted paper, the borders of each page being white. The frontispiece is a bird's eye view of the company's works at Mansfield, facing which is a group representing Thomas Baxter and his seven sons. The special features of the Monarch goods are set forth in a style to interest the dealer, and illustrations faithfully represent the appearance of the finished goods. Ample descriptive letterpress accompanies the engravings, while a telegraphic code enables the dealer to order goods by wire at a minimum of expense. With the stoves and ranges are presented illustrations of fixtures in the way of independent connections, tubing, burners, ovens, broilers, &c. The catalogue is very neatly arranged and is issued in attractive colored paper covers with embossed side title in gilt.

John Caleb Hollands of the Griswold Mfg. Company, Erie, Pa., sends us the compliments of the season and a miniature Erie griddle, with a patriotic folder printed in red and blue on white cardboard. The folder contains some "sauce" which is intended to prevent hot cakes from Erie griddles from ever producing indigestion. Griddles are a seasonable article from the varied line of plain, polished and enameled hollow ware made by the house.

Charles O Lyon, president of the Thatcher Furnace Company, 33 Peck Slip, New York, has left for Florida to spend a well earned vacation, having had none during the year 1893. He will be absent some three weeks, enjoying himself among the orange groves.

The Manhattan Gas Heating Company make a fine display of the Manhattan open grate gas heater in their showrooms at their office and factory at Fifty seventh street and Seventh avenue, New York. It consists of a specially constructed atmospheric burner with the flame burning against asbestos fiber. The size of the burner varies with the size of the grates, which are made in over 20 different styles and sizes. Some are made in cast iron, both nickel plated and copper bronzed; others are made of plain and hammered brass, either highly polished or nickel plated. The average consumption of gas is said to be about 20 cubic feet per hour, and the grates are capable of heating a room as large as 25 feet square. They act as ventilators as well as heaters, being made to connect with a flue.

The Eclipse Stove Company of Mansfield, Ohio, recently held their annual election, at which the following directors were selected: J. M. Maring of Muncie, Ind.; W. H. Gorby of Pittsburgh, Pa., and H. M. Loomis, E. B. Tappan and W. J. Tappan of Mansfield, Ohio. The Board of Directors then organized by electing J. M. Maring president, W. H. Gorby vice-president, W. J. Tappan secretary and treasurer, and A. Blanchard superintendent.

Samuel Biddle, formerly with the Keeley Stove Company and lately with Faith, Belson & Co. of Philadelphia, is visiting the trade in New Jersey in

the interests of Reeves & Horner of Philadelphia. Sam can use his knowledge of the trade in that section to the advantage of his new house.

V. Clad & Sons of Philadelphia have been awarded the contract for supplying the ranges, broilers, coffee urns, carving tables and complete kitchen equipment for the new restaurant of the Pennsylvania R. R. Company at Broad street station, Philadelphia.

Since the ordinance giving Philadelphia gas at $1 per 1000 feet was passed there have been numbers of inquiries among the stove trade in that city relative to gas stoves. Salesmen are posting themselves on gas consumption statistics, and are taking advantage of the opportunity to largely increase the sales of gas stoves.

The Grander Stove Company of Royersford, Pa., have started their pattern department on full time, and their foundry is now running two heats each week.

The Western Foundry Company have equipped a large plant on Albany avenue near Thirty-eighth street, Chicago, for the special production of light gray iron castings. They aim to produce smooth, soft castings, true to pattern, and make a specialty of such work as sewing machine castings, gasoline stove burners, stove plate castings and hardware specialties. They also do fitting and japanning. The demand for castings of this character is steadily increasing in the West, and the Western Foundry Company will endeavor to secure their share of this trade, which has to a great extent been enjoyed by distant foundries. Their main office is in room 813, Royal Insurance Building, Chicago. D. F. O'Neil is president, N. F. Purcell is manager, and M. A. Rourke is secretary and treasurer.

The Quick Meal Stove Company, St. Louis, Mo., report an excellent demand for their Quick Meal gas and gasoline stoves and ranges. At this writing they have received orders for 26 carloads. They are at work on a pamphlet devoted exclusively to their Quick Meal gas stoves, which will shortly be ready to be mailed to the trade.

At the annual election held by the stockholders of the Western Stove Company, St. Louis, Jos. Dugdale was elected president and Lucas Edel secretary and treasurer. The trade will be interested to know that Mr. Dugdale, who has been president of this company for a number of years, again resumes that position.

S. H. Shannon, who has for many years represented the Excelsior Mfg. Company in Southern Texas, will continue to look after their interests in that State, with headquarters at 4 Dallas Club Building, Dallas. George P. Philip, formerly of the firm of Cameron & Philip, at Abilene, will assist Mr. Shannon in the territory named. Mr. Shannon has issued, under recent date, a circular in which reference to the above matter is made, and also the statement that he has consummated arrangements to represent the following firms, and will be the sole agent for the sale of their products in Texas: Lalance & Groajean Mfg. Company, New York, makers of agate iron ware, stamped ware, &c.; Reading Iron Works, Reading, Pa., manufacturers of wrought iron pipe and tubing, and the Cincinnati Corrugating Company, Piqua, Ohio, makers of black and galvanized sheet and corrugated iron. Mr. Shannon has a host of friends in Texas, among whom are many of the best people in the State. He has always made it a point to look after the interests of his customers as well as guarding those of the concerns which he represents.

The Ohio Crude Petroleum Oil Stove Company of Ironton, Ohio, is the name of a concern recently incorporated with a capital stock of $200,000. The officers are W. M. Kerr, president; H. A. Marting, vice-president; L. E. Marting, treasurer; J. D. Foster, secretary and general manager, and Charles A. Hammel, assistant manager. The business of the new concern will be the manufacture of burners which are applicable to stoves, experiments in this direction having been conducted for nearly a year past at the Foster Stove Works. At present the burners will be turned out by this company and will be applied to their goods.

Newspaper reports from the West are to the effect that one half of the plant of the Great Western Stove Works, at Leavenworth, Kan., has resumed operations, and that the entire works will be in operation by February 1.

The Troy Nickel Works, Troy, N. Y., have established a branch of their business at 33 Front street, West, Toronto, Ont., under the management of Francis Foster & Co., where a full stock of the Alaska hardware specialties, embracing their complete line, will be carried for the trade for the Dominion of Canada. The opportunity is thus afforded for large and small dealers to obtain these goods promptly and in quantities to suit at the manufacturers' prices.

J. B. Oldershaw of Baltimore, Md., has issued a four-page circular relating to the Rapid Transit air circulating and ventilating stove. The merits of this heater are set forth at some length in the circular before us, and the stove is illustrated in general view. Accompanying the folder is a circular calling attention to the National adjustable cast iron chimney cap and ventilator, which is manufactured and sold by Mr. Oldershaw.

A circular has been issued under recent date to the effect that the foundry facing and supply business heretofore carried on under the name of E. D. Ransom & Co. of Albany, N. Y., was, on January 15, sold to the Albany Facing Mill Company, of whom M. J. Powers is vice-president and manager. Mr. Powers was for a long time the representative of E. D. Ransom & Co., and is thoroughly familiar with all the details of the business. The new concern state that they are in a position to supply everything needed in the foundry and machine shop line, and that their stove plate and return facings are of a high order of merit. The company are also dealers in Albany molding sand, and will continue to manufacture the well-known stove putty.

Head's Iron Foundry, Utica, N. Y., manufacturers of the Standard and Rival furnaces, has been succeeded by the firm of Giblin & Co. The new name, however, involves no change whatever in the management of the business, which will be continued in the same hands as heretofore. The firm are very well pleased with the business of last year, as the report shows that their sales approach closely the largest sales of former years. A good business is anticipated for the coming year, to meet which, we understand, they have brought out many new improvements in their line of furnaces and boilers. The engagement of the former salesmen of the firm has been renewed, and they are to cover territory as follows: Geo. J. Giblin, Pennsylvania, New Jersey, Maryland and the territory west of Chicago; Henry Cowles, New York State and the New England States, and Robt. Jagers, Michigan, Ohio and Indiana.

The Michigan Stove Company have an enterprising customer, at Benton, Wis., whose name is W. H. Nehls. Mr. Nehls has brought out a calendar for 1894, the principal feature of which is a half-tone engraving entitled "Home Treasures." It is a reproduction of a photograph of his little daughter sitting beside a Garland Junior range. The little girl nurses a doll. On the opposite side of the range is her pet dog. A toy cat is also introduced in the picture, as apparently enjoying the genial presence of the range. All the details of the figures are well brought out. The work reflects credit on the originator of the subjects of illustration, as well as the engraver, and the calendar must be highly appreciated by Mr. Nehl's neighbors and patrons.

The Walker & Pratt Mfg. Company, manufacturers of stoves and heating apparatus at Watertown, Mass., have started up their foundry after completing repairs. Almost the full complement of 200 men were given work.

The Star Cornice & Furnace Company of 716 Vandeventer avenue, St. Louis, Mo., have issued their first catalogue of the Star steel plate furnace, which they manufacture. Within the pages of this little work are briefly set forth a few of the advantages possessed by the furnace named, so far as construction is concerned, reference being made to material, quality of workmanship, &c. Views are presented showing the interior arrangement of parts, and also of the heater as it appears when set up for operation.

The Eclipse Stove Company, Mansfield, Ohio, are sending to their friends in the trade a very handsome souvenir in the form of a small thermometer, mounted upon a silvered sheet of metal measuring about 4½ x 6½ inches. The sheet is cut out in design and bears upon its face the well-known trade-mark of the company, together with the words "Every stove warranted." Opposite the 90° point on the thermometer is a wide black mark bearing the imprint in silver: "Point at which an Eclipse heater will keep mercury in the coldest of weather." And likewise opposite the 20° to 50° register is a similar mark, with the words: "Point at which it is desirable to have a stock of Eclipse heaters." The whole is a very clever piece of work gotten up in attractive form for advertising purposes.

The Board of Directors of the Buckwalter Stove Company, Royersford, Pa., organized on Saturday, January 20, by electing J. A Buckwalter president, I. Newton Buckwalter vice-president, Darlington Buckwalter treasurer, and William Stauffer secretary and superintendent.

The Cincinnati office of *The Metal Worker* was the recipient of a call early last week from F. V. Knauss, president and general manager of the Portsmouth Stove & Range Company, Portsmouth, Ohio. The company are booming their Model steel ranges, and state that the reception of these goods

by the trade at large has been very satisfactory. Announcement is made by the firm that the Model cannot be duplicated by any other manufacturer by reason of exclusive patents covering its construction, the rights of which are possessed by the company.

The Baxter Stove Company of Marsfield, Ohio, have elected John L. Baxter president for the ensuing year; C. C. Baxter, vice-president; Emmett C. Baxter, secretary and treasurer, and Edwin D. Baxter, superintendent.

The Favorite Stove & Range Company of Piqua, Ohio, resumed operations in their works on Monday, January 22, giving employment to several hundred hands.

News and Notes.

The Mayor of Cincinnati has been authorized to expend $100,000 of the contingent funds of the city in providing work for the unemployed.

Cotton manufacturing in the Carolinas is apparently the most profitable business now carried on in the South. At meetings of stockholders of nearly all the mills of North and South Carolina, held recently, it is stated that the reports presented were uniformly gratifying, and dividends ranging from 8 to 16 per cent. were declared.

French papers say that 1893 was the best vintage year of the century, the weather having been peculiarly favorable for the grape crop.

With the view of averting a threatened loss of trade consequent on the opening of the Manchester Ship Canal, Liverpool is reducing her port charges and making other concessions.

Buffalo advices report that an alarming influx of vagabonds and mendicants is taking place in that city, most of whom have come on from Chicago, where Mayor Hopkins' "no-work-no-food" order has made their business unprofitable. A steady stream of tramps and unemployed from the West is said to be moving toward the Eastern cities.

The unusual spectacle of labor giving financial assistance to capital has been afforded recently at Pittsburgh, where the Window Glass Workers' Council has loaned the sum of $50,000 to a local glass manufacturing concern to enable them to keep their works in operation.

November's fire losses show a continuation of the enormous figures recorded for each month of this year. The total fire waste of this country will probably pass the $150,000,000 mark before the end of the year; a state of things unparalleled since the big Chicago conflagration.

An interesting feature of the International Exhibition to be opened at Antwerp in May, 1894, will be the exposition, or competition for prizes, of the packing of goods in cases. It is intended to bring out the best methods of packing for various kinds of merchandise.

Dun's Review, in a carefully prepared table, gives the result of an inquiry made by them into the extent of the financial depression of 1892, as affecting the leading industries of the country. The exhibit—although, of course, not absolutely accurate, as many leading houses in the various trades failed to respond—serves to show approximately the vast injury done to the business of the United States by the panic and uncertainty of last year. In the iron and steel trade, for example, 147 reports were received, which, in the aggregate, show a decline of 39.8 per cent. Of these replies, 86 from the Eastern trade give an average decline of 32.9 per cent.; 37 from the West, 57.1 per cent., and 24 from the South, 56 0 per cent. of falling off. In the hardware trade, as represented in 66 reports, the decline was not nearly so pronounced, being in the aggregate but 18.5 per cent., as compared with the business of 1892. Territorially the respective declines were as follows: East, 17.4 per cent.; West, 25.2 per cent., and South, 14.8 per cent.

The King of Korea is rapidly adopting the conveniences of Western civilization. His Majesty has lately purchased in America an incandescent electric light plant, which is now being installed in his palace, consisting of 2000 lamps of 16 candle power, with steam engine, dynamos, &c., complete.

Trade Notes.

At New Philadelphia, Ohio, the New Philadelphia Iron & Steel Company are running part of their Sheet mills, and the new galvanizing plant is nearly completed. The New Philadelphia Wire Nail Works are running double time, with plenty of orders ahead.

The Joseph Dixon Crucble Company, Jersey City, N. J., are preparing to issue early in February a pamphlet on Lubricating Graphite. Last year they issued such a pamphlet embodying the opinion of Prof. R. H. Thurston. Since then they have collected much additional information that they will publish in the new pamphlet.

Reeves & Horner of 45 North Second street, Philadelphia, have been appointed agents for Pennaylvania, New Jersey, Delaware and Maryland for the Kankakee Mfg. Company of Kankakee, Ill., manufacturers of Refrigerators.

In another column will be observed an announcement by E. Bissell, Son & Co., 12 Murray street and 15 Park place, New York, relative to a peremptory sale of Hardware, Edge Tools, &c., on February 1. The goods thus disposed of will include Drawing Knives. Hatchets, Screw Drivers, Chisels, Hammers, Curry Combs, Files, Plumbs and Levels, &c., and also over 400 cases of Tacks and Nails manufactured by the Stanley Works.

The American Seal Paints and Cements, made by William Connors of Troy, N. Y., are brought to the notice of the public by an attractive calendar distributed to the trade. The poster is of large size, the calendar proper occupying half the sheet, being printed in white upon a brown background. The upper portion of the poster, which is the decorative feature, shows a small boy and a large plug hat, the latter being decorated by the former in an inartistic manner with American Seal Paint. The Cements are intended for slate, tile and metal roofs, stoves, ranges and furnaces.

An advertisement of more than usual interest to the plumbing trade is the page announcement in this issue of Benjamin C. Smith, 275 Pearl street, New York City. There are illustrated a number of Porcelain Enameled Iron Bathtubs of all sizes and styles of finish. In addition to Bathtubs Mr. Smith carries a general line of plumbers, supplies and sanitary specialties.

We have received from Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, a copy of the new edition of their complete catalogue and discount sheet, dated January, 1894. The book consists of 432 pages, and is of handy size for the pocket—6¼ x 5 inches—with a flexible cover of red cloth and red edges. A great many new goods have been added and are now for the first time illustrated and priced, while on a number of specialties the list prices have been reduced. The additions to their lines have been so numerous that in order to keep the book down to portable size whole departments have been condensed into one or two pages. As an illustration, their lately extended line of Crystal Steel Ware is confined to two pages, whereas to enumerate every article in this line would probably occupy 100 or more pages. The same is true of their Blue and White, Blue and Blue and White Enamel Ware lines. The Crystal Steel Ware referred to is a grade of goods which have been manufactured by Lalance & Grosjean for some years, but confined to special lines. They have now extended it so as to cover all the lines comprehended in their well known Agate Iron Ware. We note also large additions to the Japanned and Pieced Tinware departments.

An elaborate and handsomely printed catalogue and price-list is issued by the Iron Clad Mfg. Company of New York. It is a cloth bound volume 9 x 12 inches in size, 111 pages, and as announced in a prefatory note it contains a complete line of all the goods manufactured by this concern up to date, and is offered as a substitute for previous publications, many price-lists in which have been changed or withdrawn. The volume contains many specialties, new since the last general catalogue was issued. A new feature in thia catalogue is the designating of articles by numbers instead of capacity or dimensions, which is done to avoid confusion and mistakes. Their customers are requested not to order "the same as last," but to specify the gooda in each case. This is a matter that has been referred to by other firms in various lines of business, and the amount of trouble and possibility of error involved in thia careless way of ordering goods is not appreciated by the buyer. The volume is most thoroughly illustrated and is divided into sections, beginning with Iron Clad Enameled Iron Ware. Then come Milk Cans; Galvanized Iron Ware follows; then Retinned Steel Ware, Bakers' and Confectioners' Supplies, Engineers' and Mill Supplies, Range Boilers, Expansion Tanks and Boiler Stands. The Boilers include both vertical and horizontal forms of various sizes. Miscellaneous goods close the body of the pamphlet, which is concluded with an alphabetical index.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until February 15, for the steel and iron work of superstructure of the United States Court House, Custom House and Post Office at Omaha, Neb., including iron columns, floor, ceiling and roof construction, skylight, framing, &c. Drawings and specifications may be obtained from the Supervising Architect, at Washington, or at the office of the superintendent, at Omaha.

TRADE REPORT.

The Iron Market.

Reports from the leading producing and distributing centers confirm the impression, first observed last week, that there has been a distinct improvement in the demand. But it must be frankly acknowledged that the larger volume of business has been at the sacrifice of values, which have further receded, although it was thought impossible that lower prices could be reached.

The argument that crude and finished Steel could not be sold at a lower range has become so threadbare that it takes courage to repeat it. Honestly and earnestly affirmed in the past, it has been belied by the course of events. And yet it is certain that $10.50 for Bessemer Pig at Pittsburgh and less than $15.50 for Billets are rock bottom as to cost. The indications are that buyers, so often disappointed last year, are sharing that conviction and are taking hold in some branches.

In ordinary grades of Pig Iron the Southern furnaces have surrendered and are selling at lower prices. Recent contracts in the East for Cast Iron Pipe have been taken by Northern shops, but considerable inquiries for additional quantities are in the market, among others from suburbs of Boston, Syracuse, Albany and Yonkers. It is figured that between 30,000 and 40,000 tons are coming up.

In finished material the Wire trade is developing more activity. This has led to the buying of Wire Rods at about $23, Western works, and the placing of contracts for Billets. Thus far the improvement in the demand seems to have come from the general trade. The requirements originating with the railroads, the greatest customers of the Iron trade, are still amazingly small.

Pig Iron.—The New York market is quiet, although the Southern producers are somewhat weaker. Consumers are still buying from hand to mouth and are not carrying any stock, and cases are frequent when extraordinary means must be adopted to hurry Iron forward. Recent Cast Iron Pipe contracts have been taken by Eastern shops, R. D. Wood taking the Brockton 1800-ton order at $22.89 delivered, while Emaus captured 1000 tons for Cambridge, Mass. We quote standard brands, $13 @ $14 for No. 1; $12.50 @ $13 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $13.50 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12 for No. 3; $11.25 @ $12 for No. 2 Soft, and $12 @ $12.50 for No. 1 Soft.

The volume of business in Pig Iron in the Philadelphia market has been heavier than for some time past, and from the number of applications for prices it is thought probable that the next two or three weeks will show something still heavier. Nothing favorable can be said in regard to prices, but if the demand keeps up as expected prices will take care of themselves. The demand in the meanwhile is for consumption pure and simple, and not because Iron is cheap. It is thought that consumption is not more than 60 per cent. of what it was a year ago, so that there is room for improvement, even if there is no change in prices. Two or three large lots that are about to be closed are expected to be at the lowest figures yet recorded, not that the market is in any worse condition, but because this is almost the first opportunity that holders have had for unloading good sized lots, and they are not likely to miss their opportunity for 25¢ @ 50¢ ℔ ton. General quotations for city or nearby deliveries are about as follows:

No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

Sellers of local Coke in Chicago report an excellent trade in carload lots but very little doing in larger quantities. Southern Iron is also moving in that market in small lots only and consumers are not disposed to contract ahead. Prices continue to show a drooping tendency. Competition for business is, if anything, more keen than it has been, and wherever Northern and Southern Irons come in contact the price named on the former is such as to take the business. Lake Superior Charcoal is moving in a small way, and on carload lots a much better price is obtained than if buyers were making large contracts. Transactions of this kind are reported somewhat above our quotations. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.30 @ $15.50
Local Coke Foundry, No. 1	13.00 @ 13.50
Local Coke Foundry, No. 2	12.50 @ 12.75
Local Coke Foundry, No. 3	12.00 @ 12.50
Local Scotch	13.50 @ 14.00
Ohio Strong Softeners No. 1	15.00 @ 15.50
Southern Silvery, No. 1	..... @ 13.75
Southern Silvery, No. 2	..... @ 13.25
Southern Coke, No. 2	11.65 @ 11.90
Southern Coke, No. 3	11.40 @ 11.65
Southern, No. 1, Soft	11.65 @ 11.90
Southern, No. 2, Soft	11.40 @ 11.65
Tennessee Charcoal, No. 1	16.00 @ 16.50
Tennessee Charcoal, No. 2	..... @ 15.00
Alabama Car Wheel	18.00 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

Advices from the Pittsburgh district intimate that the Pig Iron market there shows no material change, either as regards demand or prices, except that prices hinted at last week are openly quoted this week. Quotations are given as follows:

No. 1 Foundry	$11.75 @ $12.00, cash
No. 2 Foundry	11.25 @ 11.50 "

There is no improvement in the tone of the Southern Pig Iron markets. On the contrary it is evident that no large sales of Southern Iron could be effected without making concessions, which would doubtless be done if there was shown to be any disposition to buy in a large way at lower prices. The jobbing foundries have generally completed their contracts for the finished product, and will not buy the raw material until they have use for it. And so there is little more than single car lots selling to them. Consumers in November contracted for more Iron than they required and are now taking it on old contracts and probably will continue to do so, so that there is more melting of Pig Iron than there is selling, and yet if it was all purchased now it would not amount to a satisfactory volume of business, and yet there are some indications that there will be an increase in the demand for many articles in the not far distant future. Quotations are merely nominal, as follows:

Southern Coke, No. 1	$11.75 @ $12.00
Southern Coke, No. 2	10.75 @ 11.00
Southern Coke, No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—The distinctively new features in the market for this metal are that prices have averaged lower, and that a few hundred tons of "duty paid" Tin have been placed upon the market by dealers who would not buy from the leading holders of Tin imported prior to the date that the McKinley duty went into effect. That there was a financial loss in selling duty paid Tin on the basis of current quotations is obvious, but that little circumstance seemed to have been greatly personal, or sentimental, and has had no direct bearing upon the market. In any event evidence is wanting that either jobbers or consumers have deviated in the slightest degree from their former policy of buying in a conservative way, and the speculative interest has not enlivened affairs perceptibly. Spot and current month delivery has been offered freely at 20¢, and March

delivery at a shade less. June delivery was offered at 19.90¢, July at 19.50¢, August at 19.25¢, September at 19¢, October at 18.75¢ and November at 18.50¢, on the Exchange.

Copper.—There have been no really new developments. The demand is slower, if anything, than it was a week ago and sellers have refrained from doing anything that would afford a basis for suggestion of weakness in the market. The fact is demonstrated, however, that it is easier to buy than to sell Lake Superior Ingot at 10¢, and that other varieties of Copper are not in a more enviable position. Still there is the redeeming feature that Brass manufacturers are more busily engaged and that there has been some improvement latterly in the demand for their goods and that the market for several lines of manufactured Copper shows some improvement. A better price than 10¢ for round lots of Lake Superior Ingot is strictly the exception, however, where actual sales are involved, and other varieties are on about the same basis. Jobbers' prices for small lots of Ingot Copper remain unchanged, with rather more inquiry and a slight increase in orders.

Sheet Copper.—The consumptive demand for Sheet Copper has shown rather more life during the past week, although still remaining considerably below the average for the season. One or two comparatively large contracts have been negotiated, but as a rule orders are confined to moderate quantities for immediate use. Prices remain the same as previously quoted on all manufactured Copper.

Pig Lead.—About 200 tons of common Western have been sold at 3.17½¢ delivered here, prompt and near future shipment. Nearly if not the entire quantity went to consumers. This class of buyers are not offering above 3.15¢ at the moment, and manifest extreme indifference. A few speculators bid 3.15¢ for single carload lots, but their offers seem to be nicely timed, as though intended for speculative effect. The fact cannot be disguised, however, that the market remains in poor condition, nor is any material revival looked for before the early spring months.

Lead Pipe and Sheet.—No improvement is noted in the demand for Manufactured Lead or Plumbers' Supplies. The depressed condition of the building trades gives but little prospect of any large increase in the demand for these products until a sufficient revival of business develops to induce the prosecution of building operations now in suspense. Prices are inclined to weakness.

Spelter.—There have been moderate sales of common Western at 3.50¢ and a few carloads on the spot were disposed of at 3.47½¢, if, indeed, not at a shade less. As far as actual business is concerned, the market shows weak tone and there is nothing in the way of demand that tends to change the complexion of affairs in the least. In short, the market looks weak and is positively dull.

Tin Plates.—No radical change has taken place in the character of the demand for Tin Plates during the past week. The condition of the market is regarded by the trade as decidedly disappointing, the volume of business being but little more than one-fourth what it usually is at the present season. There have been some fair sales of 100 lb and lighter weight ordinary Coke for future delivery, but beyond these transactions the general demand continues to be of a perfunctory character. Stocks are generally acknowledged to be slight, yet prices are weak and on the lowest level of the season. Notwithstanding the encouragement of low prices, however, consumers cannot be induced to purchase a box in excess of their absolute needs. The market altogether is in poor shape, as regards gooda, both for spot and future delivery. It is very apparent that nothing of any magnitude will be done in Tin Plates until the settlement of the tariff question. A number of importers, it is said, are carrying purchased stocks over in England, pending tariff developments, and are drawing from them as orders come in.

A London dispatch to *The Iron Age* of January 24 reports the demand for Tin Plate in England to be somewhat better, more orders having been placed. Prices, however, continue low and generally the cheapest of the season. Full weight, 14 x 20 Bessemer Cokes went at 10/ f.o.b. Swansea, and that seems to be now a common selling price. The outlook is not regarded as encouraging for the British manufacturers. Buyers of Oil sizes are holding back with a view of obtaining still lower rates. Liverpool prices are quoted as follows:

IC Charcoal, Alloway grade	12/3 @ 12/9
IC Bessemer Steel, Coke finish	11/ @ ....
IC Siemens " " "	11/3 @ ....
IC Coke, B. V. grade, 14 x 20	11/ @ ....
Charcoal Terne, Dean grade	10/6 @ ....

The Los Angeles Iron & Steel Company of Los Angeles, Cal., have their rolling mill so well along that they expect to put it in operation about March 1. The mill will contain one stand of three-high plate rolls, 22 x 60 inches; one stand of two-high roughing rolls, 26 x 90 inches; one stand of two-high sheet rolls, 22 x 42 inches, and one three-high 20-inch muck train. They will use wrought iron scrap and steel billets, and will make Sheet Iron, Light Plates, Corrugated Roofing, and at an early day expect to add a galvanizing department. Familiar names are seen in the list of officers. F. N. Myers is president; A. S. Robbins, vice-president; J. G. Chamberlain, general manager, and Fred. R. Harris, superintendent of the mill. With men of such long experience and high standing in charge there is every reason to look for a successful career for this new enterprise.

Chicago Report.

Scrap.—Consumers are still holding off. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

We learn that the connections heretofore existing between the Central Stamping Company of this city, on the one side, and the Lalance & Grosjean Mfg. Company, New York, and the St. Louis Stamping Company, St. Louis, on the other, have been severed, the two latter concerns retaining no interest, direct or indirect, in the first named. The severance has been of an entirely amicable character, and solely for the business interests of each concern. The only effect of the change will be that the Tinware heretofore manufactured and sold by the two concerns for the account of the Central Stamping Company will now be furnished directly by the Lalance & Grosjean Mfg. Company and the St. Louis Stamping Company, respectively.

M. Brendel, 509 West Twenty-eighth street, New York, issues a circular illustrating his improved fire proof Metal Lath. He specially recommends it for elevator, light, dumb waiter and ventilating shafts. He also makes the Universal Cat Fence, a device intended to keep cats off the tops of city fences. The usefulness of this last article, if successful in its operation, will be readily appreciated.

CONDITION OF THE

Hardware Trade.

THERE ARE INCREASING INDICATIONS that a turn has been reached and that business is beginning to improve. There is certainly very much more activity in mills and factories, giving employment to many thousands of operatives, some of whom have been idle for months. The good effect of this will, of course, be felt almost immediately in all lines of business. We are also in receipt of confidential advices from many representative manufacturers in the Hardware and related lines, nearly all of whom report an evident improvement in business, some of them referring to a marked increase in their orders. The jobbing trade also refer to a perceptible improvement in the volume of business, and the trade are evidently buying somewhat more freely than for some time. They are still pursuing a conservative course, and are buying only such goods as are required for their immediate use or to replenish stocks which had become too much depleted and broken. The fact that the retail trade throughout the country have a much smaller quantity of goods on hand than usual is one of the important features of the situation, as most merchants are required to purchase at once in order to be in position to meet the demands of their customers. In the matter of prices there is little improvement to note and a strengthening of the market cannot be expected until the demand assumes a large volume. The small number of failures reported since the opening of the year is an indication of the general soundness of the mercantile classes, and the apprehensions of some who anticipated a different result with the closing of last year's business have thus been disappointed. Collections generally are reported as fair. There is little doubt that the financial condition of many houses is more satisfactory now than for some time, as the past half year with its close collections and curtailment of credits has witnessed a large diminution in the indebtedness of many merchants.

Advices from Chicago.—The Shelf Hardware jobbers report a larger volume of business last week than previously. The demand continues of the same character as before. Good contracts are placed for spring delivery of seasonable goods, while the demand for Shelf Hardware is comparatively light. Reports from the building trades are encouraging, and it is believed that the low price of building material will cause an increased number of enterprises to be started up this spring, which will lead to an excellent demand for all classes of building material, which will include many articles of Hardware. Nails are even now feeling the indications of an improved condition, and retailers are ordering very freely from the jobbers. Collections are fair, and little complaint is heard of the slowness of country dealers in settling their old accounts. The Heavy Hardware trade is in hardly as good condition as Shelf Hardware, owing to the slackness of business among the smaller class of manufacturing consumers.

Notes on Prices.

Wire Nails.—There is evidence of an improved feeling in the Wire Nail market. This is seen not so much in the matter of prices as in increased demand. Manufacturers are receiving many inquiries and booking a good many orders which come to them from both the large and the smaller trade. As a consequence there is much activity in the mills, and manufacturers are feeling more confident in regard to the course of business during the season. Prices have not as yet felt to any marked degree the influence of this increased demand, and the market is still represented by the quotation of $1.10 for carload lots at mill, from which price a concession of 5¢ is made on attractive orders. Sales, however, have been made on some large orders at $1, but this is an exceptional figure which some of the manufacturers refuse under any circumstances to meet. The New York market is represented by the quotation of $1.20 on dock, with the usual advance on small lots from store.

Advices from Chicago—Manufacturers of Wire Nails report that so many orders have been booked for future delivery that prices are held more firmly. An unusual proportion of the Nails has been specified for delivery in March, and makers are beginning to fear that they will have some trouble in filling all such orders promptly, and are urging buyers to anticipate the stipulated time to make sure of getting the supply they need. Ordinary factory lots are unchanged at $1.20, Chicago. The advance recently made in Cut Tacks has thrown an increased business to the manufacturers of Wire Tacks who are thus in receipt of excellent orders in a line that for some time has been rather quiet. Jobbers have had an exceedingly good demand for Wire Nails from retailers and their shipments for the past week have been large, and yet prices are not inclined to be stiff, but to range more nearly to manufacturers' terms. Small lots from stock are quoted at $1.25 @ $1.30.

Cut Nails.—There is somewhat more inquiry for Cut Nails than during the past few weeks, and manufacturers report an increased volume of business. Prices are also somewhat firmer, if not actually higher. The market is represented by the quotation of 95 cents in carload lots at mill, from which concessions are sometimes made on attractive orders. At a recent meeting of the Eastern Cut Nail manufacturers, at which the large producers were represented, it was decided that the practice of selling at a factory price should be discontinued and the delivered price only be named. The New York price was accordingly fixed at $1.05 base for carload lots on dock. The New York market is therefore represented by this quotation, with the usual advance on small parcels from store.

Advices from Chicago.—Manufacturers of Cut Steel Nails report large inquiries from the West. Their nearby trade is continuing in about the same volume as reported last week, which was quite fair for this time of the year. Sales of Clinch and Casing Nails are much above the average in the Cut Nail trade for the past two or three years, which indicates some reaction in favor of these Nails. The price of factory lots on the regular basis is $1.15, Chicago, but concessions are made on high averages. Small lots from stock are selling at $1.20 to $1.25.

Barb Wire.—There has been little change in the Barb Wire market since our last report. A good many inquiries are being received and the manufacturers are anticipating an active demand as the season opens. There is, as mentioned in our last report, considerable divergence in the quotations of the different manufacturers, some mills selling carload lots of Galvanized Four Point at $2 and others holding firmly to $2.10.

Advices from Chicago.—The volume of business in Barb Wire is increasing. Jobbers report their customers taking hold with something of their old time freedom, doubtless influenced by the low prices now ruling, which are so much more in their favor than they had anticipated. Carload lots of Galvanized may be quoted at $2 20 to $2.25, and small lots from stock $2 30 to $2.40.

Emery.—The manufacturers of Emery have adopted the following revised list, which bears date of January 11, 1894. It will be observed that advanced prices are announced in Flour, CF, F and FF:

	Grain. Nos. 4 to 46 inclusive. Cents per lb.	Grain. Nos. 54 to 180, inclusive. Cents per lb.	Flour. CF, F & FF. Cents per lb.
In kegs of about 300 pounds	4½	5	3
½ " " 150 "	4¾	5¼	3¼
¼ " " 75 "	5	5½	3½
10 pound tin cans, ten in case	6	6½	5½
" less than " "	10	10	8

Crocus at same prices as the fine grain.

Lawn Sprinkler.—The Jewel Lawn Sprinkler, manufactured by the Detroit Sheet Metal & Brass Works, 64–72 Orleans street, Detroit, Mich., and illus-

trated in *The Metal Worker* of January 20, 1894, is sold, f.o.b. cars Detroit, 90 days, 2 per cent. for cash in 10 days, at the following net prices, according to quantity :

Per dozen	$8.00
Per dozen, gross lots	7.00
Per dozen, six gross lots	6.00

Folding Barrows.—The Champion Folding Steel Frame Wheelbarrows manufactured by the Bryan Mfg Company, Bryan, Ohio, are sold at the following net prices :

	Per doz.
Steel frame, steel wheel, wood tray	$18.00
Steel frame, steel wheel, steel tray	30.00
Steel frame, steel wheel, Garden	30.00

Grate Guard.—The Monarch Grate Guard, manufactured by the Cincinnati Mfg. Company, Cincinnati, Ohio, and illustrated in our issue of January 13, 1894, is sold assorted per dozen at $3 net.

Shoe Rest.—The Perfection Shoe Rest, manufactured by The Standard Mfg. Company, Dayton, Ohio, are sold, f. o. b. at destination, at the following net prices:

Japanned, per doz	$13.80
Nickeled, " "	18.00

Shot.—A reduction in the prices of Shot is announced under date of January 22. The revised quotations are as follows, terms net cash, 30 days, or 2 per cent. discount for cash in 10 days:

	Per bag.
Drop Shot, sizes smaller than B, 25-pound bag	$1.30
Drop Shot, sizes smaller than B, 5-pound bag	.35
Drop Shot, B and larger sizes, 25-pound bag	1.55
Drop Shot, B and larger sizes, 5 pound bag	.40
Buck and Chilled Shot, 25-pound bag	1.55
" " " " 5-pound "	.40
Dust Shot, 25-pound bag	2.00
" 5-pound "	.45

In lots of 2000 pounds and upward, taken at one time, a discount of 20 cents per 100 pounds and 2½ per cent. will be allowed.

Perfection Cutters.—The new Perfection Cutters manufactured by North Brothers Mfg. Company, Philadelphia, Pa., for whom John H. Graham & Co., 113 Chambers street, New York, are agents, are sold at the following prices, subject to a discount of 33⅓ per cent.:

No.	Each.
101	$2.00
102	2.75

Tomato Supports.—The Tomato Supports manufactured by Leonard, Lewis & Co., Utica, N. Y., for whom Wiebusch & Hilger, 84-86 Chambers street, New York, are agents, are sold at $1.80 per dozen, less a discount of 33⅓ per cent.

Glass.—The outcome of the proposition to close all Glass factories February 10 is still doubtful, but those well informed on the subject consider that there is little likelihood of a shut down at that time, as the assent of 85 per cent. of all the pots is necessary to make the agreement binding. It is understood that two of the largest plants in the country are unfavorable to the scheme, and some of the smaller plants are passing into the hands of the workers themselves. Prices on American Window Glass have not improved since our review of the market last week. New York quotations are given as 85 and 10 per cent. discount for single strength Glass, this price being shaded in some cases. Pittsburgh quotations are 85 and 10 and 5 per cent. discount on single, and 85 and 20 per cent. discount on double strength Glass. Imported Glass has been affected by the low price of American Glass and by the proposed reduction in tariff, and Window Glass is quoted at 80 and 10 and 10 and 5 to 80 and 15 per cent. discount. Imported Plate Glass is quoted at 70 and 5 to 70 and 10 per cent. discount. It is reported that a falling through of the agreement among importers to sustain prices has helped to demoralize the market. The foregoing quotations on imported Glass are referred to by those in the trade as approximately representing the selling price of imported Glass should the proposed tariff go into effect. Jobbers atate that low prices are bringing inquiries and orders for American Window Glass, and that enough Glass is being made to supply the demand.

Old Metals.—Old Metals are still in but very moderate demand, and nothing in the nature of a revival of business is yet in sight. Prices continue low and irregular. The following quotations represent about the prices paid by New York dealers for moderate sized lots:

Heavy Copper	℔ 7¢
Light and Tinned Copper	℔ 6½¢
Heavy Brass	℔ 5¢
Light Brass	℔ 4½¢
Lead	℔ 3¢
Tea Lead	℔ 2¾¢
Zinc	℔ 2½¢
No. 1 Pewter	℔ 14¢
No. 2 Pewter	℔ 6¢
Wrought Scrap Iron, ℔ gross ton	$7.00 @ $8.00
Heavy Cast Scrap, ℔ gross ton	8.00 @ 9.00
Stove Plate Scrap, ℔ gross ton	4.00 @ 5.00
Burnt Iron, ℔ gross ton	2.50 @ 3.00

Old Rags, Paper, &c.—A dull and waiting market is the characteristic feature of the trade. Paper mills are buying only enough material for their immediate requirements, and dealers in Paper Stock are well supplied with material. Prices in the New York market are quoted generally as follows:

No. 1 White Rags	℔ 3¼ @ 3⅛¢
No. 2 White Rags	℔ 2¼ @ 2⅛¢
Mixed Rags	℔ ⅞¢
Blues and 3ds	℔ 1 @ 1¼¢
Hard Sized White Shavings	℔ 2¼ @ 2⅛¢
No.1 White Book Shavings	℔ 2 @ 2⅛¢
No.2 White Book Shavings	℔ 1 @ 1⅝¢
Light Book Shavings	℔ ¾¢
No. 1 Mixed Shavings	℔ ¾ @ 1 ¢
No. 2 Mixed Shavings	℔ ½ @ ⅝¢
No. 1 Printed Books	℔ 1 @ 1¼¢
Ordinary Mixed Books	℔ ½ @ ⅝¢
Newspapers	℔ 2-5 @ ½¢
No. 1 Manila Paper	℔ 1 @ 1⅛¢
No. 2 Manila Paper	℔ ⅝ @ ¾¢
Bogus Paper	℔ ½¢
Common Paper	℔ ⅝¢
Straw Chips	℔ ½¢
Binders' Clippings	℔ ½ @ ⅝¢
Jute Butts	℔ 1⅞ @ 2 ¢
No. 1 Jute Bagging	℔ 1 @ 1¼¢
Mixed Bagging	℔ ¾ @ 1 ¢
No. 2 Bagging	℔ ½ @ ¾¢
Hemp Twine	℔ 2 @ 2½¢
Manila Rope	℔ 2½ @ 2⅝¢
Jute Rope	℔ 1½ @ 1¾¢
Mixed Rope	℔ ¾ @ ⅞¢

Old Rubber.—The market for this material remains very quiet. New York dealers' prices are nominally as follows:

Car Springs, ton lots, ℔	@ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔	@ .03
Rubber shoes, less than carloads, ℔ 0.02¼	@ .03⅛
Large Hose, ℔ ton	@ 9.00
White Wringer Rolls, ℔	@ .04¼
White Syringes, ℔	@ 05

Glass Screens.

A very interesting series of experiments, according to reports in a German technical paper, have been made by Richard Zsigmondy of Vienna on the transmission of heat through different kinds of glass. It has long been known that bodies equally transparent did not let through the heat that accompanied the light with corresponding freedom, and, furthermore, that some opaque bodies permitted the heat to pass freely. Ordinary clear glass cut off a portion of the heat, and this quality adapted plate glass to be used as fire screens. Rock salt, on the other hand, permitted both light and heat to pass freely, while a black solution of iodine, which cut off the light entirely, offered very little obstruction to the radiant heat. All these and many similar facts have been known for a number of years, but there is still a good deal to be learned in the field of heat and light transmission if valuable practical results were to come of the investigation.

Radiant Heat and Glass.

Mr. Zsigmondy in the experiments alluded to began with the idea that alum resisted the heat rays, and so he had glass made containing a large per cent. of alumina, but while the results showed a much greater amount of heat cut off by the alum glass than by ordinary glass there was reason to suspect that the difference was rather due to the presence of iron on the surface than to the salts of aluminum in the body of the glass itself. Without describing the experiments in detail it is enough to say that, acting on the suspicion that the iron was the cause of the glass cutting off the heat, a number of specimens of glass were prepared containing from 1 to 4 per cent. of iron oxide. The first sample, containing 1 per cent., was for certain reasons the most satisfactory. The glass was about ⅛ inch thick and of a light blue color, and when tested with a gas flame it permitted less than 1 per cent. of the heat to pass, while with ordinary glass of similar thickness 60 per cent. of the heat was transmitted. Tested by the sun the iron glass transmitted 12 per cent. of the heat, compared with 86 per cent. transmitted by common glass.

Practical Applications.

The possible application of this discovery is of more than usual interest, for there is a very wide field of application to a greater or less transparent glass that will at the same time be opaque to radiant heat. The color would furthermore be an advantage in many instances, for it would add to the decorative effect of the glass. Plate glass screens for open fires could be made of such a glass to advantage, but perhaps what would be of the greatest usefulness would be lamp shades and chimneys around wicks burning kerosene. Nowadays lamps are used a great deal for evening reading as well as for general illumination, and if a transparent shade could be made which would cut off the heat from the face and head of a person reading nearby the effect would be decidedly pleasant and also probably of advantage to the health. It is to be hoped that this reported discovery is not like those many rumored inventions which are always being announced as going to revolutionize the world and which never amount to anything more than a rumor. The discovery we have referred to is, however, entirely probable, and furthermore is reported by a German technical paper of high standing.

Reformative Industrial Education.

The New York State Reformatory, at Elmira, which was established by act of Legislature in 1876, has long been taken as a model institution of its class. Its objects, as officially set forth, are to "take charge of males between the ages of 16 and 30, convicted of felony and not previously convicted of crime," and "to prevent them from committing crime, to secure their self support and to accomplish their reformation." Among the agencies utilized for this end, one which is considered of the first importance is a very complete system of trade classes, in which the prisoners are given a valuable industrial education, designed to send them forth into the world, at the expiration of their terms of detention, equipped with the means of earning an honest livelihood and so becoming useful and independent members of society. From a neatly gotten-up little book, printed and publishsd in the reformatory, we learn that no less than 1,615 inmates received instruction in the trade classes of the institution during the year 1892. Of 672 men received during the 12 months over 600 had no trade, while of 338 paroled during that period all except 47 went out to work at trades learned during their incarceration.

Trade School in Elmira.

The trade classes are held during the evenings in buildings specially adapted for the work and equipped with all modern facilities, while the tuition is given by expert instructors in the various trades. About 37 different classes are taught. Among those which have the largest number of pupils are the bricklaying and plastering, molding, plumbing, carpentry, painting, tinsmithing and brass-finishing trades. As a proof of the thoroughness of the instruction imparted it is pointed out that all the work of these trades required inside the reformatory in recent years has been carried out by the inmates, who have acquired their industrial capacity within its walls. The good thus done in sending young men, who were never hardened criminals, out into the world at the expiration of their terms of detention with the means of self-support at their fingers' ends can hardly be overestimated. Under the old penal systems a residence in prison meant, in the majority of cases, the ruin of a youth, who too often became on his release a recruit in the great army of loafers and criminals, whereas under the Elmira system he has every incentive to work out his redemption and gain his lost position through the medium of the trade knowledge that has there been put into his hands.

Trifles.

In one of Wilkie Collins' stories a stupid constable who had passed inattentively the most significant clue to a robbery because, as he said, he thought it only a trifle, is rebuked by an experienced London detective with the remark that, although much older than the constable, he had never yet seen a *trifle*. The lesson conveyed in this is that anything, no matter how trivial it may appear, has some significance and importance. It might be added with equal truth that in all mechanical and industrial operations it is the close observer and student of what to more common minds appear to be trifling matters who attains to superior skill. It is they who pay most careful attention to minute details, who firmly adhere to the principle that in their calling there is nothing so unimportant that some best way to arrange it or to perform it is not worth considering, and who strive to find the best way, that become organizers of industrial enterprises and rise to places of trust and responsibility.

Western Building Prospects

Western architects report a decided awakening in building projects. In some instances architects' offices are actually crowded with work, whereas only a short time since the prospects seemed decidedly unfavorable in the building line. There may not be many sky-scrapers among the new buildings on the boards in Chicago, but of less pretentious business structures and dwelling houses the number to be erected this spring will compare favorably with others easons. In the smaller Western cities the same conditions are reported to exist, with here and there an enterprise of some magnitude for the locality. The building trades gen erally will be far from stagnant. The change to a fair degree of activity will be hailed with pleasure by all interests involved, comprising a very important part of the business energy of the country. The building trades suffered their full share of the consequences of the depression in business which set in so acutely last spring.

Ease in money and distrust of manufacturing and commercial ventures seem to be the factors which are potent in the revival of building activity. It is certainly not because there is an urgent demand for more houses. But real estate security has ever been deemed the safest basis for investment, and it is specially attractive now to those who fret because their idle money is steadily accumulating yet dare not risk it as they freely did up to the time of the panic. A lower rate of interest can consequently be secured by owners of building lots who desire to make improvements and have long awaited a desirable opportunity. This has come not only in a lowering of the rate of interest, but also in the heavy decline in the cost of building material and wages of workmen in the building trades.

The cost of building in the largest Western cities has of late years been unreasonably augmented by the extravagant demands of the workmen. Through their unions they not only advanced their wages almost beyond precedent, but also shortened their hours of daily toil, thus making the cost of building cumulative. The edge has been rather roughly removed from the sharpness of these conditions during the past six months. Workmen who considered themselves quite poorly paid at $4 per day of eight hours of but moderately skillful labor have been known to feel thankful in securing a job paying but $10 per week, even if they were occasionally called upon to put in a 12-hour day. It is estimated that in the vicinity of Chicago, and perhaps the same is true of the West generally, the reduction in the cost of building as compared with 1892 and the early part of 1893 is about 40 per cent. The inducement to men of some means to make improvements which have long been contemplated is, therefore, seen to be quite strong.

As to speculative building, in anticipation of the wants of a home-loving people, it can be said that there never was a time more favorable than this for the consummation of building enterprises on a large scale. Cheap money, cheap material and reasonably paid labor form a combination not often seen in this country, and advantage should be taken of it when it does exist. Ere long the life-blood will again flow freely through the business arteries of the nation, the body politic will be reanimated with healthful vigor and the present languor will be succeeded by a rush of activity. It will then be found that our constantly expanding population will need more house room. Families that have been forced to huddle in a few rooms to reduce expenses will feel able to indulge in better quarters and will seek to secure them. Houses built this year will not be much, if any, in advance of the time when they will be needed.

Rustless Coating for Iron.

The following is a translation by Mr. Frederic W. North of a paper read before the Paris Société d'Encouragement by M. Octave de Rochefort-Lucay, on the new Bertrand processes for coating with magnetic oxide and enamelling iron and iron carburets, and on a new process of tinning for cast iron.

Messrs. Barff and Bower were the first to practically coat iron, steel, and cast iron with magnetic oxide, so as to form, at the cost of the metal itself, the protective layer that is obtained usually from paint, or from enameling, &c., with a thin coating of a metal that is not oxidizable.

The Bertrand processes are more simple than those of Bower and Barff, and are based on a new discovery in chemistry, and may be stated thus: If a thin adherent film of another metal is formed on the wrought iron or on the cast iron, and this iron or cast iron, heated to 1000°, is exposed to a current of oxidizing gas, the oxygen penetrates through the film, oxidizes the iron, or the cast iron, and under these conditions magnetic oxide is the result. The formation of magnetic oxide, thus obtained, continues indefinitely, and the thickness of the coating of oxide increases according to the period of exposure to the oxidizing current, providing the temperature remains at about 1000°.

As to the film of metal deposited in the first instance, it disappears in some obscure way, forming oxides which mingle with the magnetic oxide or volatilize, according to the nature of the metal of which they are composed. M. Bertrand had then to find the best metal and the best method for depositing it on the article to be coated, and he has found that bronze, a mixture of copper and tin, gives, from a practical point of view, every satisfaction. For depositing this bronze on the wrought iron and cast iron M. Bertrand uses electricity or wet baths, and uses sulphophenolic acid.

The following is the method adopted in the Bertrand manufactory for an oxidation: The article is cleansed (the cleansing is not indispensable), then dipped a few moments in a bath containing a solution of sulphophenate of copper and tin. The coating of bronze being formed, the article is immediately washed with cold water and dried with sawdust. The article dried is put into a furnace. Oxide forms, and at the end of 15 to 30 minutes (according to the articles) the article is taken out, sufficiently oxidized. The coating produced varies from $\frac{1}{10}$ to $\frac{1}{5}$ mm.

M. Bertrand uses electricity to ascertain if the coating is of sufficient and uniform thickness, and in doing so he makes use of bells. If in putting the two wires in contact with the oxidized article the bells ring the current passes —the oxidation is insufficient; if it remains silent the oxide formed is of sufficient practical thickness, because it prevents the electric current from passing.

Process for Tinning Cast Iron.—M. Bertrand has also used sulphophenolic acid to obtain tinning on iron. He dissolves salts of tin in a mixture of water and sulphophenolic acid at the rate of 1 per cent. of tin salt and 5 per cent. of sulphophenolic acid. In this mixture the article, which is previously cleaned, is dipped; and is at once covered with an adherent coating of tin, and afterward, by the means of rotating brushes in wire and cloth, the coating of tin is polished, and a result obtained which is both effective and cheap.

Process for Enameling.—There are not more than two processes for enameling cast iron. In the first, called hot, the iron, heated to a vivid red, is powdered with a flux powder (borosilicate of lead), distributed with a sieve, then it is heated, and when the flux fuses it is powdered afresh with glass, more soluble, forming the glaze of the enamel. This process, the only direct enameling, is dangerous to the operator, and even impossible for large articles, nor does it allow of decorations. The second process consists of dressing the cast iron by three distinct and successive operations in the furnace with a kind of pottery. In the Bertrand enameling, the article is first coated with magnetic oxide, then dipped in borosilicates of lead, colored by metallic oxides, in which is added a little pipe clay in order to give rather more body. The article thus covered cold, by dipping or with brushes, is put into the furnace; the enamel adheres and vitrifies at the usual furnace temperatures used by enamelers. By putting a coating of colored enamel with a brush on a first coat simply plain, it is possible to make any decorations desired, which may be burned in at one operation for outdoor vases, &c. These results, due to the first oxidation with magnetic oxide, are remarkable, as much for the color as for the tenacity of the enamel and its resistance to rough usage.—*Journal of the Society of Arts.*

The situation in the plate glass industry of the United States is reported to be very serious for the manufacturers. Most of the factories are closed, being unable to run on the former scale of wages, and prices are demoralized, while there is no market for the product. The makers claim that the present crisis is due to the proposed reduction of the duty on plate glass by the Wilson bill, which if carried into effect will bankrupt the factories.

California's Midwinter Fair was opened to the public on Saturday. The paid admissions to the grounds on that day numbered 72,248.

The population of New York City, according to recent estimates of the Bureau of Vital Statistics, is now 1,929,376.

THE LETTER BOX.

Weight of Galvanized Iron.

From R. R., *Enfield, N. H.*—Please inform me through *The Metal Worker* what the standard weights of different numbers of galvanized iron are; also if the weights have been changed within a year.

Answer.—On July 1 last a standard gauge of galvanized iron was adopted, being based on the United States standard gauge for sheet iron and steel, as approved March 3, 1893, and which came into effect July 1. The basis of the new gauge is so many ounces per square foot of metal, and the galvanized iron gauge is 2½ ounces per square foot heavier than the black iron gauge. The following are the gauges of galvanized iron and their weights from Nos. 15 to 30 inclusive:

Gauge No.	Ounces per square foot.
15	47½
16	42½
17	38½
18	34½
19	30½
20	26½
21	24½
22	22½
23	20½
24	18½
25	16½
26	14½
27	13½
28	12½
29	11½
30	10½

Dead Black Finish.

From E. E. H., *Fairbury, Neb.*—Will *The Metal Worker* or some of its readers tell me how the dead black finish is made that is found on wrought iron fire sets?

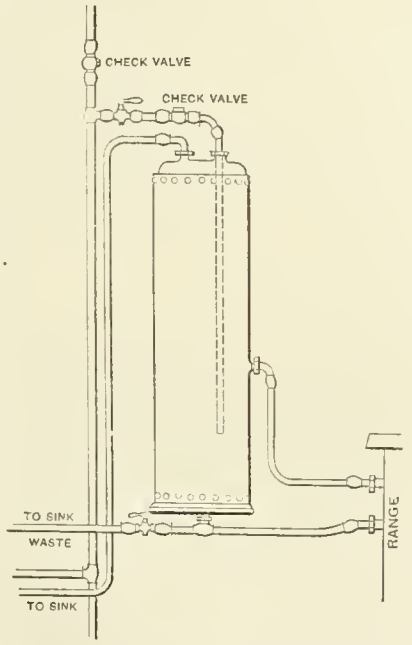
Note.—If any of our readers are doing such work the method they use will make an interesting contribution to the Letter Box. From one of the workshop receipt books we take the following, which is said to give a dead black finish: "Dissolve seed lac in 95 per cent. alcohol q. s., mix refined lamp black with alcohol and add enough seed lac varnish to make the lamp black adhere, but not enough to give it a gloss. Strain through cheese cloth. Apply with a soft varnish brush."

Pipes From Tank.

From R. D., *New York.*—I would like to offer a suggestion to "M. T. C.," who reported his difficulty with overflow pipe from tank in *The Metal Worker* of December 23. If he will put in a tee and nipple at D, all the same size as overflow, and extend the nipple a few inches above tank, this arrangement will make it work every time. If the water should flow freely to the overflow—that is, to fill the full bore of the pipe—doubtless some air would get trapped and perhaps stop the flow, but it would be only temporarily, as the air would soon find its way to the surface and the flow again be established.

Water Backs Burst Repeatedly.

From T. J. K., *Brooklyn, N. Y.*—About four years ago I set nine ranges in three three-story single flat houses in this city, which were connected to boilers, &c., by a plumber engaged by the owner of the building. The ranges were in use about six months when one of the water backs burst, cut clean in



Water Backs Burst Repeatedly.

two, and breaking the end of the range. I put in a new end and water back, and about two months after the same back burst again. One year after another burst, and last week, nearly four years later, another one, all being on the middle floor. I claim it is due to some fault of the plumbing, but to satisfy the owner, who thinks the fault is with the water back, I refer the question to you. I send you a sketch of the range, boiler and connections. The cold water supply runs from the main in the cellar in a single line to the top floor, which is the third story. On the second floor in each house there is a check valve in the cold water branch, between the stop cock and the boiler, and on the top floors the valve is in the main line, about 24 inches above the sinks. When the houses were finished it was found that there was not enough pressure at times to force water to the top floors, so a pump was put in on the top floor of each house, and a check valve put on the main line on the second floors above the boiler, to prevent, as the plumber said, the family on the top floor from drawing water from the boiler on the second floor. About one month after the pumps were put in there was a new main laid in the street, and they now have pressure enough and do not use the pumps But the check valves were not removed and are still in the pipes. The plumbing work is the same on each floor, except that there are no check valves on the first floor. The water backs that burst were on the second floor and did not burst with any great force, such as would occur if the supply pipe were frozen, but simply split in two, breaking the end of the range next to the back.

Answer.—We agree with our correspondent that the arrangement of the plumbing work has more to do with the bursting of the water backs than a lack of strength in the water backs themselves Steam is the probable cause of the water backs bursting in the case mentioned. If it were the direct cause the explosion would have been with such force as to make the results disastrous. We are inclined to think that there was a cessation in the supply of water to the water back, or if not an entire cessation, a very greatly reduced pressure. Under such circumstances steam would generate in the water back to a greater or less extent. The condensation of this steam would create a vacuum and the inrush of water filling the space would strike a blow, the force of which has not been accurately determined to the satisfaction of engineers who have considered the subject, but is sufficient to split a water back. The arrangement of the check valve and stop cock so close together at the top of the boiler would naturally reduce the size of the waterway and increase the friction at that point. Any generation of steam in the water back would create a back pressure, which would close the check valve and stop the supply for the time being. If the stop cock were located at a different point, so as not to reduce the waterway, and the check valve entirely removed, we think a material relief would be given. If the stop cock must be placed at this point, one should be used which will give a waterway the full size of the bore of the water pipe.

Finding a Radius.

From SNIPS, *East Hampton, N. Y.*—Very frequently we of the craft have to get at the radius of a circle of odd numbers and odd fractional parts, as $17\frac{3}{8}$, $7\frac{3}{8}$ and $21\frac{7}{8}$. I have an easy way to get the half of the above numbers, which is to take one-half of the next smaller even numbers, in these cases 16, 6 and 20, which we find to be 8, 3 and 10, respectively. Then add the numerator and denominator of the fraction together for a new numerator and double the denominator, which in these cases are $\frac{3}{32}$, $\frac{11}{16}$ and $\frac{15}{16}$, respectively, and added to the even numbers give $8\frac{3}{32}$, $3\frac{11}{16}$ and $10\frac{15}{16}$ as the radii.

Fails to Heat First Floor.

From J. B. O., *Baltimore, Md.*—In answer to "A. G. D., in *The Metal Worker* of January 20, who asks for information about a fire place heater, it is not every kind of heater that will successfully heat the rooms as described, and especially when arranged in the chimney flue as stated. I take it, there is no fire place in the parlor. If that is so, the right thing to do would be to put the register in the parlor near the ceiling, with the cut off above, as mentioned. Then make a duct through the washboard 2 or 2½ x 6 inches into the flue directly back of the stove. By that means a circulation of atmosphere will take place in the parlor, exhausting the cold air and furnishing a continuous supply of warm air.

Rattling Noise in Boiler.

From R. L. M., *Hamilton, Va.*—In the issue of January 27 I note what "Subscriber" says about rattling noise in boiler. I had the same experience with the first boiler I ever put in. I had a range and a 40 gallon boiler. Water back was tapped for ¾ inch pipe, and I made the whole connection with ¾ inch iron pipe. It worked well for a while, and then began to rumble in such a manner as to frighten the occupants into pulling the fire out at times. I found the upper elbow, next to the water back, partially closed with a substance similar to calcined plaster, which I supposed was due to lime in the well water. I substituted 1-inch pipes from the water back to the boiler and have had no trouble since.

Fails to Bake on the Bottom

From STOVE DEALER *Port Henry, N. Y.*—I have had the same trouble as reported by "W. S.," in *The Metal Worker* of January 20. I have had it in connection with a two flue range and a chimney with a strong draft. The partitions making the flues do not run far enough front, consequently the flame and hot gases make a short circuit, leaving the front, or left end as you face the oven, comparatively cold, while the back or right end will be "sissing" hot by the up-flue. I have remedied the cases that I had by lengthening the flue strip, taking a piece of sheet iron the width of the flue strip, cutting two notches in it and crowding onto the flue strip, leaving a space of about 5 inches (in one case 3½) between end of strip and front plates of oven. I generally cut the strips slanting toward the bottom at one end rather than square. I have always succeeded in making the ranges work to the satisfaction of parties having them.

From J. B. O., *Baltimore, Md.*—In answer to the question of "W. S.," Guelph, Ontario, in the Letter Box of January 20, I suggest: Perhaps the flues of the stove that would not bake on the bottom were so large that the products of combustion passed through them too rapidly to heat the bottom oven plate. In that case it would be necessary to put a damper in the smoke pipe in order to have better control of the chimney draft. I have found this to be the case in many instances in my experience, both with stoves and ranges. We are too apt to jump at the conclusion that it is for lack of draft, when in fact there is a superabundance. Then, again, the stove that would not bake might have required a smaller pipe than the other stove that did bake. The one was made, say for a 5 inch pipe and that pipe was put through a 6-inch pipe hole without proper adjustment; the other stove adapted for a 6-inch pipe and put into a 6 inch pipe hole. Nine times out of ten the latter will bake and the former fail. All stoves require proper pipe.

Note.—We cannot agree with our contributor in his conclusion that the draft at times is too strong when there is a good body of live coals in the fire chamber. Under such conditions the air or gases are at the highest temperature immediately on leaving the fire, and the quicker they get to the bottom of the oven the hotter they will make it, and if the current is continuous its rapidity will subject the bottom oven plate to a greater heat rather than interfere with its being heated, for less heat will be lost in transit. A temperature over 350° is seldom required in an oven, and the temperature of the products of combustion from a fire under the influence of a rapid draft of air through it will often be three times as high. If the draft is slow the fire will not be so hot and the products of combustion will leave at a comparatively low temperature in small quantities, and their movement will be slow, permitting greater loss of heat.

From U. S. R. Co., *Utica, N. Y.*—In answer to "W. S.," whose stoves do not bake on the bottom, our experience is that you only get what you pay for these times, and that stoves half fitted and mounted are not all sure workers, after increasing the draft by larger pipe or topping out chimney. Take the stove apart and remount and putty joints well and the stove will do the work. We have had trouble with stoves under the same conditions as mentioned, and after remounting them put them back in the same house without building up chimney or replacing larger pipe than capacity of collar on stove, and they worked satisfactorily. You seldom hear of first-class stoves working this way, and manufacturers will bear us out in the statement that there are too many cheap goods in the market. This experiment is worth trying, as it is what we have done, and we speak from experience.

From H. C. S., *Kenosha, Wis.*—I notice a query from "W. S.," Guelph, Ontario, in your issue of January 20, in regard to the slow baking of some ranges or stoves on the bottom, while others will work perfectly in the same place. Of course, it goes without saying that when an exchange of that kind is made it is very seldom that the same make of range is used. We usually put in some range that has been thoroughly tried and that we are sure of, or we must experience the same trouble. I find that many times ranges with a bottom oven rack are addicted to this trouble. Take the rack out entirely and your range will bake all right. But the main trouble with this kind of ranges is the pipe collar or smoke outlet of range. Many manufacturers, mostly in the East, provide too small a pipe collar. When a high chimney, such as in large cities, gives an extraordinary velocity to the smoke, the small pipe collar will do, and, moreover, adds to the saving of fuel, but in smaller cities or towns, where the draft is slower, owing to a lower chimney, these ranges will always be bothersome. My motto is never to sell a range with a small pipe collar to parties who use a short chimney. Give them a range with sufficient size of smoke outlet to create draft without hindrance, and give them a sheet flue if possible.

From D. H. B., *Phœnix, Ariz.*—To the inquiry of "W. S.," Guelph, Ontario, I would make the following suggestion: The flues of the ranges are too deep. Try putting ashes or sand 1 or 1½ inches in depth on the bottom plate. When the range gets thoroughly tempered you will have to scrape the sand out a little at a time. Try it.

Electric Gongs.

From D. W. E., *Reading, Pa.*—There is a discussion concerning the best way to hang an electric bell. Should the gong be above the magnet or below it? I should be glad to see the question discussed in the columns of *The Metal Worker.*

Answer.—In order that the vibration in an electric bell may be regulated, it is necessary that it be hung in the position intended by the manufacturers. Formerly the practice was to hang the gongs below the magnet, but this has been superseded by the plan of placing them above the magnet.

A Question of Water Pressure.

From X. K., *New York.*—Please answer the following questions in the Letter Box. Is there any difference of pressure in the three vessels shown, all being of the same hight but of different diameter and shape? Is the tank on the inclosed sketch high enough to force water a distance of 400 feet successfully, the hydrant being 2 feet lower than the bottom of the tank?

Answer.—The sketches have not been reproduced, as the vessels are readily described. The first is 6 inches in diameter and 40 feet high, with a flat bottom and a pressure gauge at the side. The second is 20 feet in diameter, with a flat bottom and the same hight. The third is of the same hight, and 20 feet in diameter until it reaches a point 10 feet from the bottom, where it begins to taper to a ½-inch pipe, to which the pressure gauge is attached at the bottom. In answer to this question, the gauge would register the same pressure in each case. The pressure of water at a given point is equal in every direction, and depends on the hight of the water above it and not upon the quantity in the vessel or its shape. A thumb rule for calculating pressure is to allow ½ pound pressure for each foot of water in hight, which is slightly in excess of the true pressure. The second sketch shows a round 20-barrel tank, located 400 feet from a hydrant, the outlet of which is 2 feet lower than the bottom of the tank, and connected with it by a 1-inch galvanized iron pipe. A 20 barrel tank would hold about 700

gallons, and would necessarily be about 5 feet in diameter and 5 feet high. When the tank is half full the water level would be 4½ feet above the hydrant outlet, giving a pressure of about 2 pounds to overcome the friction in traveling through the long pipe and force water out. This would not cause a rapid discharge of water, and might not be sufficient, so that raising the tank or enlarging the pipe would be necessary to increase the supply. Some information relating to the last question will be found in *The Metal Worker* of September 30, 1893

Ventilation.

From VENTILATION. — The article in your issue of January 13 in regard to heating and ventilating is timely. No doubt, in the near future, electricity will be employed for heating our buildings, as it is now utilized for lighting them. But the question of ventilation will remain a vital one, just as it is at present. It is astonishing how greatly it is neglected. Most of our public buildings are put up in total disregard of the entire subject. We went into a woman's club house in a Western city, the other day, and at the dedication the president congratulated the members on the fact that they had secured a perfect system of ventilation. We happened to converse with the builder in regard to it, when we were told that the ventilating flues simply extended to the attic, and that the attic was a closed room having no connection with the outside. You can judge how much ventilation that building had.

A great many people fancy that ventilation is a profound science. There is nothing mysterious about it at all. The law is simply that every human being needs 2000 cubic feet of fresh air per hour. When he does not get it he suffers. Now, the sole problem is to admit this amount of air and to take it out when vitiated. It can be done by means of flues, without any fans or machinery. I have seen at least one public building constructed in this way. This is the Greeley School of Peoria, Ill. I don't know who was the builder or the architect, but the plan is so exceedingly simple that it deserves commendation, because it is accomplished without the aid of fans or machinery, and it seems to me anybody could do it, because all there is to it is a system of flues What is there to ventilation after all but the science of building a flue large enough to admit the necessary amount of air, and building another flue large enough to take out the bad air, and what sense is there in building tight boxes, such as are in use in most of our cities ?

It appears to me that a matter so simple and at the same time of such vital importance should be settled by law. No public building designed for the accommodation of people, no court room, opera house, school or church should be constructed without providing for this matter of ventilation. We regulate now their construction in one particular, that all doors must swing outward. Why should we not with equal justice provide that they should furnish not only means of easy egress, but also supply plenty of fresh air to the public who patronize them ? There is no patent on this plan, and it does not interfere with any one's right, and it does not prevent public competition, but it would simply lay down plain and general rules that every architect and builder must follow. It does not take a costly system of fans or machinery to do it. It simply provides that the architect must consider this subject when he plans the building and not leave it until afterward as an extra.

Origin of Tariff.

From E. P., *Baltimore, Md* — Being a maker of tinware and consequently interested in the Wilson bill and its bearing on the tin plate duty, the word "tariff" has been a prominent one in my course of reading for the last month or more. Can you tell me through the Letter Box what is the actual meaning and origin of the word ?

Answer. — According to Webster, "tariff" is "a schedule system, or scheme of duties imposed by the government of a country upon goods imported or exported;" or "any schedule or system of rates, charges, &c." Its origin is believed to be the name of a Moorish chief—Tareef—who, possessing a fort on the Spanish coast near Gibraltar, was accustomed to levy toll on vessels passing through the straits. His toll became an understood thing, and the amount was always added to the price of the goods.

Fire insurance companies have not experienced a profitable business of late years, and fire insurance stocks are, with but few exceptions, not regarded in the same favorable light by investors as was formerly the case. A statement printed by the New York *Journal of Commerce and Commercial Bulletin* shows that only 29 fire insurance companies are now on the stock list, whereas their number in 1879 was 80. The majority of these latter have in the interval terminated their existence through failure. And yet, with this great weeding out, the existing companies as a rule show a material shrinkage of profits as compared with their returns of 15 years ago. The enormous increase in the fire losses of the United States in recent years is, of course, mainly accountable for this state of affairs. Fire underwriters complain, however, that, as compared with those of other corporations, their tax charges of all kinds are entirely disproportionate and unduly heavy.

A marked revival of activity in real estate is reported in New York and Brooklyn. Several important purchases of city property have been consummated within the past week, and there has been a considerable increase in the number of plans for new buildings and alterations filed with the Building Department of both cities. Among the contracts for costly buildings to be erected in New York during the year is a $1,000,000 structure up town for the United Presbyterian Society, and a number of other erections only a little less important.

A significant indication of reviving confidence and prosperity is seen in the reassuring reports of the condition of the dry goods trade throughout the country. The *Dry Goods Economist*, which has been making a canvass of all the large dealers, states that most gratifying reports have been received from every quarter. A large, healthy spring trade is looked for.

Management of Men and Manufacturing Industries and Hints on Labor's Problem.

Recognition of and Kindness to Employees.

BY THOS. D. WEST.

It would be very difficult for any court to find, by trial, many manufacturers who could not prove that in the erection and management of their plant more or less consideration was given and money expended for the welfare and comfort of their employees.

Thousands of dollars have been expended by firms in equipping plants with good ventilation, light, sanitary conveniences and almost every kind of device that modern appliances can offer to make cheerful, comfortable and convenient work shops. In nine cases out of ten the employees are more likely to abuse or ill use the privileges than to give the employer any credit for his kind consideration. The majority will insist that such improvements were not given with the view of making the workman's lot any more cheerful or lighter to bear, but solely because a larger and better return in work or profit would be expected.

We admit that it is conducive to that end, but not to the degree which workmen generally insist it is, and if it were the purport of this article to prove it we would have very little difficulty in doing so; but knowing as we do that there are employers who do consider the welfare of their men in the construction of buildings and improvements, and in the majority of cases only get abuse for it, we will endeavor if possible to ferret out the cause for this lack of appreciation on the part of the employees.

Fortunately, or unfortunately, it has been my lot to know from experience the true feelings, thoughts and ideas which workmen possess when they stand on a low plane, because the writer started at the age of ten to assist in making bloated bond holders, supporting non-producers in luxury, creating the wealth of the world, &c.

Our whole trouble is due to not thoroughly understanding and retrying each other's side of the question. Employers might go on and furnish a free banquet for dinner every day, have reclining chairs for an hour's noon "nap," take their men home in a four in hand every night, and at the close of the year divide the dividends, if any, among their men and still fail to have them contented. Why ? Simply because they would still believe that the employer had the "lion's share."

Little does the man who has never been a "commoner" know of or realize the true feelings and ideas of a workman who has false ambition and looks from a low level at an employer through the lens of ignorance.

They never look at millionaires and think that when they do have a banquet three times a day, dress well and have the best of the land, nearly every cent they pay for it is returned to labor, giving employment to thousands of people, and that at the end of life they leave all their wealth to continue being beneficial to mankind. They never stop to think about the labor of the world that is employed in manufacturing luxuries, furnishing amusement, &c., although they are not elements really necessary for the maintenance of life.

Every man who has a small bank account is a capitalist; and the more of

such there are the less is the tendency of or opportunity for massing wealth in the hands of a few. If labor desires a more even distribution of wealth there is but one sure way of obtaining it. and that is, strive by industry and "ability" to secure it. If you cannot be a "big fish in the puddle," you can be a little one, and thus assist in creating a more even distribution of the country's wealth, which labor is calling for.

It is only against the miser or hoarder who will not invest his wealth that labor should always be "bucking." Such are its real enemies.

"That's all right," says some one a little higher up the ladder who does not want to labor any more or is too lazy to do so; "we recognize all you say to be true, but we still object to the unjust division of wealth. Our stock in it should be larger. We do not object to purchasing more of life's luxuries, and also becoming beneficial in order to assist in furnishing employment to labor."

Now, upon the answer to such logic hinges some solution of the problem. It is not the purport of this article to show all of the ins and outs of the subject. Suffice it to say that the manufacturers and all well informed men of to-day know that three-fourths of American wealthy business men are self made, and that there is nothing to prevent any man who has brains, who will put an end to drinking, idleness and giving more time to other people's business than his own, from rising and becoming an employer of men, and perhaps a millionaire. We also know that if to-day all the wealth of the world were equally divided, the lack of self denial and power to hold money and manage it would in an astonishingly short space of time place it again in the hands of those possessing energy, brains and ability. These are the three elements that to-day are most necessary to be discussed and thoroughly illustrated by employers in a manner to be recognized by the employee before he is going to be able to intelligently appreciate kindness or respect ability and recognize such as of value. It is the weight of responsibility that often loads down well to do business men or millionaires so heavily that it makes it impossible for them to take any pleasure out of life.

The time is here when it behooves all employers to take an interest in any element that can tend to enlighten and prove to the employee concerning the responsibilities and care carried by a manager, boss or business man, and the ability required for success in any enterprise. The majority of workmen think that money is the only element required to make money, and that if they could control a few thousands they would soon be rolling in wealth. Brains or ability with them are a secondary consideration. Their knowledge of their power and of their necessity are very limited. Their maxim is more, "any brainless dude having money can make money." A workman's conception of capitalists and business men is strengthened and verified in many erroneous, deceptive ways that could be exposed.

One great factor lost sight of is the sincerity of a workman's ideas and opinions. Many think their actions are chiefly inspired by prejudice, by a desire for spite or by a love for destruction of property. This is where many are mistaken. Workmen are sincere and conscientiously think they are right and honestly justified in worrying and "bucking" an employer to their full power. "He is an enemy robbing us of our just share in the wealth of the world. Down with him!" is the cry. And the majority feel and mean every word of it. Some effort must be made to guide them aright in understanding the principles in political economy that adjust and award wealth to man, and counteract those who for self gain lead them to error.

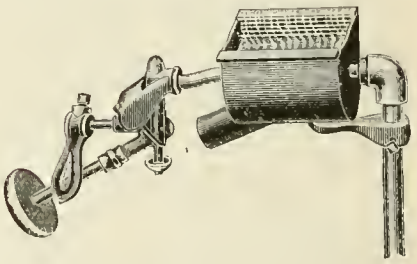
The manufacturer and employers of labor have too long permitted the buncombe politician, lawyer and theorists to mislead labor in direct opposition to its own interest. We have had nearly all kinds of "ages" but the practical age, and that is now drawing in upon us with a brilliancy that cannot but enlighten and make the world better for its appearance. There will come a recognition and development of brains, ability and energy by all classes. It will call out and support practical literature, discussing past errors. Ability must prevail in order to maintain civilization and do justice to all in a much more satisfactory degree than is done to-day, and the sooner employers and experienced, practical men take a hold of this—the duty that awaits them—so much nearer are we to seeing the bars taken down which to-day so unjustly separate labor and capital. Capital is to blame, like labor, in many ways for the strife existing between them. One of its errors is that it holds aloof too much from labor. Employers must endeavor to get into closer contact with their employees, and, instead of only spending $10,000 for shop conveniences for the benefit of employees, and then passing them by on the street with a recognition cold enough to chill the blood before the vibrations of "how de do" can reach their ears. Try stopping to cheerfully inquire after their welfare, and ask if there is not a good word you might be able to put in for them somewhere. Learn if in going to buy that little piece of property they are going right about it. Make sure that no sharks have them in tow, and if they have sickness at home let them realize that you sincerely sympathize and can be relied upon as a friend in need should the services of such be required. Don't be in any hurry to leave them. Let them tell their troubles in their own way and advise them the best you can, leaving them with the instruction to call upon you any time they might want advice or assistance. Such courtesy and treatment does not involve any sacrifice of control or independence in your management of men as employees, and if you have never tried it, do so with a few of your worthy employees, and if the writer's experience would lead him to predict results, it would be that half a dozen such made friends would be of more value around your plant than any two or three thousand dollars that might be invested in conveniences for the benefit of employees.

As an employer striving to secure recognition for kindness and consideration from men while engaged in labor, your kindest acts and thoughts will often be misconstrued as for self gain. As an individual outside of your works, wholly disinterested in what a man may be doing, you can by warming up to those worthy of your respect and attention make friends of workmen who would follow you through thick and thin. "Warm up" to those you can and they will take care of the bilious, prejudiced cranks and would be bosses for you and assist them in making their existence still more miserable if they insist on fighting against common sense justice and making themselves disagreeable.

Of course an employer cannot create appreciation or respect for his good will in one day. He has got to await developments for opportunities when kindness and substantial assistance can in a kind, dignified manner be tendered. But when you have gained the confidence of your employees you are in a position to make a confidant of them when adversities or hard times come to you. When it is absolutely necessary that less wages must be paid in order to meet the market or procure work, you can generally count upon your men accepting it with a grace you cannot mistake, as complimentary to the confidence they repose in you as an employer. Never forget that it is a poor rule that will not work two ways, and that when you can command a fair price for products, and business is good, be not too slow in raising their wages, especially to those possessing energy, brains and ability.

Hull's Double Soldering Furnace Burner.

The accompanying cut illustrates a double soldering furnace burner newly invented by M. L Hull, 24 Broadway, Cleveland, Ohio. It is 3½ inches long



Hull's Double Soldering Furnace Burner.

and quite wide, as the illustration shows. The flame strikes inward from both sides, heating the iron on either side and the bottom at the same time. The heat is said to be very intense and but little fuel is required, the statement being made that but two quarts of gasoline per day will heat ordinary coppers for use. The fire burns through sawed slots at the side and a sawed slot in the bottom under the feed pipe to generate the gas. It is pointed out that owing to this construction no drops of solder can plug the burner. It is economical of heat, as the frame will be so constructed that when the first copper is taken out the second one will roll down and take its place.

A large number of riotous miners consisting of Huns, Slavs, Italians and Frenchmen, created a reign of terror in Allegheny County, Pa., on Saturday by burning and demolishing the works at several collieries, committing theft and arson in Bridgeville and the neighboring towns, and attacking the mine operators. A serious amount of damage was done and blood was spilled before the riot was quelled by force of arms.

The United Collieries Company, a Western Pennsylvania corporation, have instructed their counsel to bring suit against the Pennsylvania Railroad Company for $300,000 damages for alleged unjust discrimination in freight rates and for violating the Interstate Commerce law.

TIN PLATES.

Tin Mill Practice.

Considering the authenticated fact that nearly $5,000,000 have already been invested in the tin plate industry of the United States, and the additional fact that several new plants are now in process of construction, it is about time to look for some important improvements over imported methods used in the manufacture of this staple commodity.

During the introduction of the industry Americans have been almost entirely dependent upon the brains and ingenuity of foreigners for best results. Agents have been sent to Wales to become familiar with best methods and have visited Welsh manufacturers to make direct purchases of machinery. In several instances this machinery has been set up in American workshops, but never used, except as a model for American mechanics to improve upon. Now that the industry has been established on a good footing and is in danger of being injured by adverse national legislation, Americans will, according to precedent and in the exercise of their natural instincts, use their own brains and ingenuity to organize systems of working and invent machinery and appliances to reduce the cost of production to a minimum, so as to compete successfully with imported products of cheap labor.

Secrecy regarding processes and machinery is almost a hobby in some branches of industry among the British, and secrets are only transferred from one to another after a long term of apprenticeship. In this country it is a more difficult matter to keep such secrets. Young men want to know, and if not told will find out, manufacturers exchange ideas more freely and mutual advantages are enjoyed. Such a course of action is necessary to build up the new and important tin plate industry.

Improvements which have been made public up to date pertain mostly to minor details of pickling machines or tinning pots, and in some instances noticeable changes have been made, the importance and value of which is not yet definitely determined. Among other inventions coming under the latter classification is a new design of annealing furnace, which is constructed upon a plan entirely different from old styles.

Vertical Annealing Furnaces.—Fig. 1 represents a vertical section of the proposed furnace and building suitable for its operation. The intention is to dispense with the old method of charging and drawing annealing boxes horizontally through doors at the side of the furnace and substitute a method of charging the furnace vertically, by mechanical means instead of manual labor. In the former method at least six men are required, and their work is arduous in character. Men need to be expert in handling boxes by means of a lever truck, and must become accustomed to work in close proximity to high temperatures. In the method suggested, loaded boxes and standa or bottom plates may be moved easily by two men to and from any part of the annealing house, the means used being an inexpensive hand power traveling crane, not necessarily of a capacity exceeding 3 tons. This crane, which is

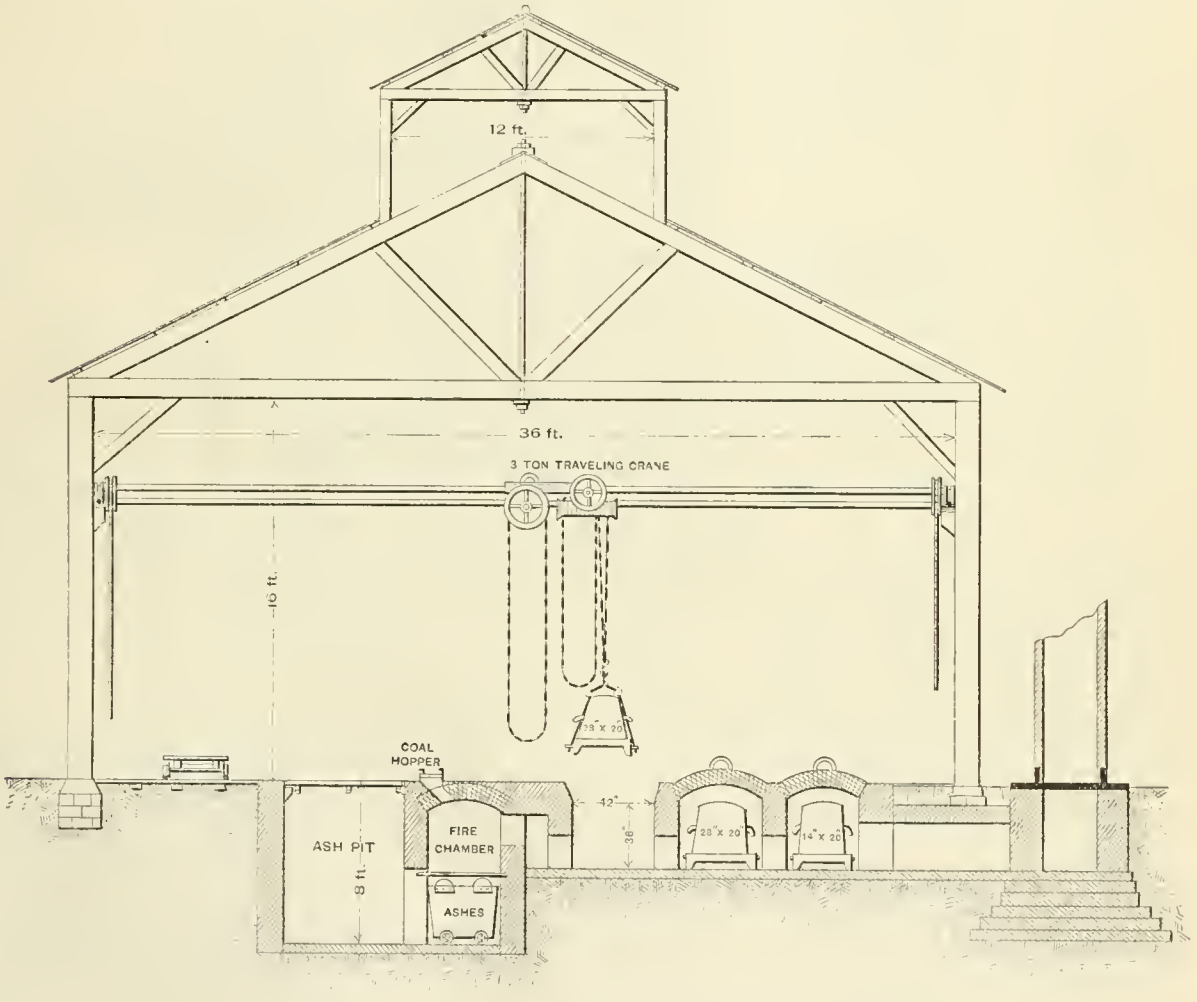


Fig. 1.—Sectional View through Building.

VERTICAL ANNEALING FURNACE PLANT.

illustrated in Fig. 1, though not in detail, is constructed to act quickly and steadily, moving boxes without disturbing their contents. The racking gear moves the carriage of the crane to right or left on the beam, and by a similar contrivance the whole device is moved from one end of the building to the other.

Before describing the furnace it is necessary to state that, for the effective operation of the system, it is suggested that the bottom plates be loaded while in position upon the truck shown in the illustration. After the cover is placed over the pile of plates to be annealed the whole arrangement is transported from the shears, or opener's bench, to the annealing house, and is ready to be picked up by the traveling crane and charged into the furnace.

It will be noticed that there is no obstruction above the floor of the annealing house to interfere with the operation of the traveling crane. The furnace is built below ground, and heat which would otherwise be wasted is retained.

Method of Firing.—The fire chamber is novel in construction, being fired from the top, through a cast iron hopper placed in such a position as to conduct the fuel to the center of the fire. This hopper might also be constructed so as to be placed in the center of the arch and form part of the key. To agitate the fire on the grate bars, without descending the ash pit, a rocking grate is suggested, the lever extending above the floor level. The ashes falling from the grate are caught in the iron wagon shown in the drawing, which is removed by means of the traveling crane to the railroad track, and afterward taken to the dumping ground outside the building. No dust arises and the method is cleanly. The ash pit, which measures only 4 x 5 feet, can easily be kept covered after ashes are removed.

Charging Furnaces.—The manner of charging the furnace is as follows: There are three heating chambers, the size of which must be regulated by the size of bottom plates used. When the boxes are placed in the chambers to be annealed the sections of arches shown in Figs. 2 and 3 are placed in position, a little fire clay dope is used to fill the crevices and the furnace is ready for operation. In Figs. 2 and 3, referred to, the construction of these arch sections, which form the roof of the furnace, is illustrated in detail. The frame is made of cast iron with a hook inserted by which the arch is lifted. Next to the top of the frame a layer of asbestos packing is placed. This acts as a non-conductor, and as the furnace is not at any time heated above 1750° F., workmen will not be troubled with the heat.

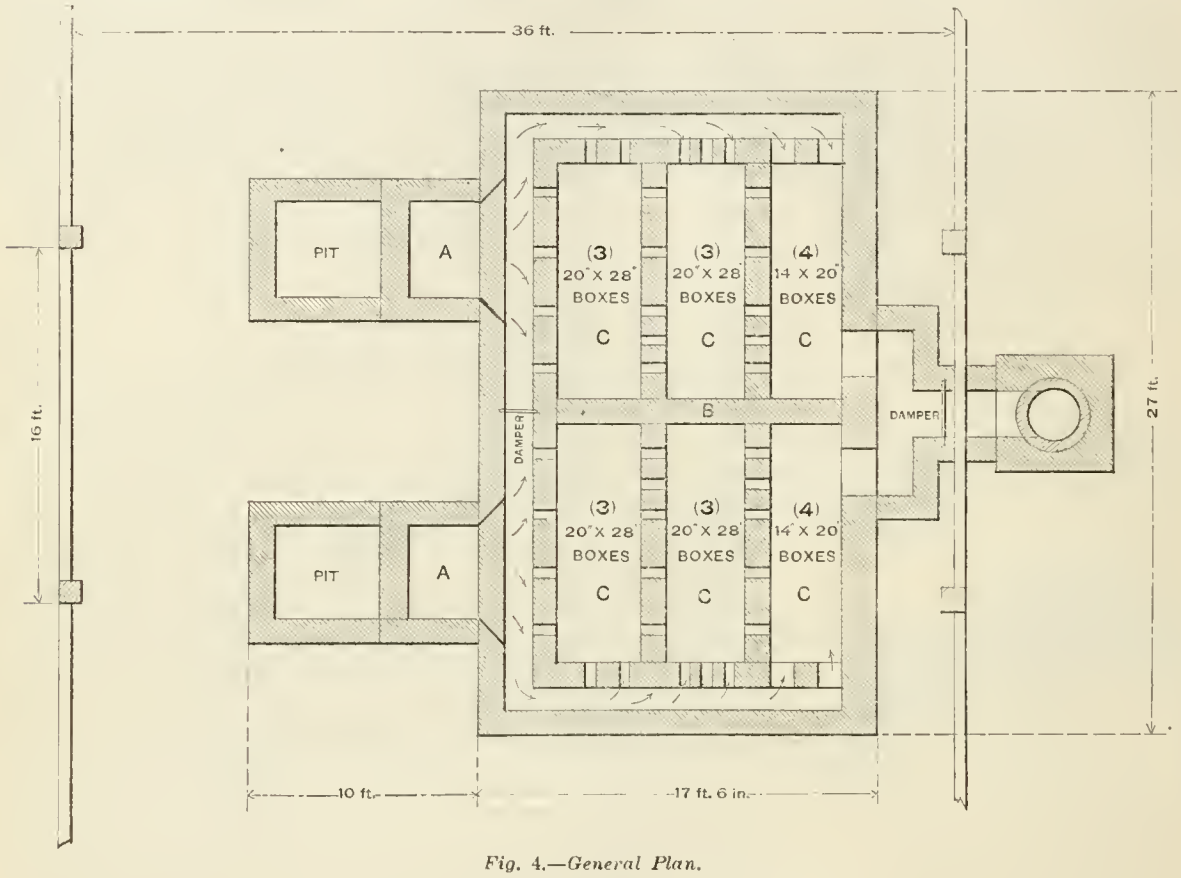

Fig. 4.—General Plan.

VERTICAL ANNEALING FURNACE PLANT.

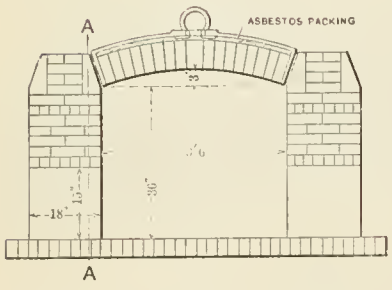

Fig. 2.—Section Showing Asbestos Lined Arch.

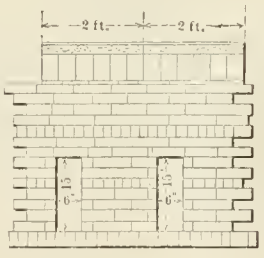

Fig. 3.—Section A A, Fig. 2.

VERTICAL ANNEALING FURNACE FOR SHEETS.

In the illustration, Fig. 1, the two chambers nearest the smoke stack are shown covered, with annealing boxes in position. In the chamber nearest to fire the arch is removed, showing annealing box suspended in process of charging. From the description given and illustrations referred to the general idea of the system will be readily understood.

General Plan.—In order to effect economy in construction for a given capacity, also to economize space and fuel, this furnace is designed double, having two fire chambers, A, Fig. 4, and a dividing wall, B. The two parts of the furnace may be worked together or separately, and two different temperatures maintained. This is effected by proper use of the dampers, one placed between the two fire chambers and the other near the smoke stack.

In the construction of this furnace great attention has been paid to securing a perfect distribution of heat, and the heat conducting passages and ports are so graded that it is possible to concentrate or decrease the heat at any desired point at the will of the person in charge. The two divisions of the furnace may be varied in temperature, as previously stated, or any part of the furnace may be worked hot, cold or at an even temperature. To accomplish

this, it is only necessary to place loose fire brick in any of the ports where it is required to cut off heat.

Around three sides of the six heating chambers C there is a passage 3 inches wide along which the flames and heated gases travel, entering the heating chambers through ports shown in the inside walls and indicated by arrow marks, which also describe the course of flames from the chamber. It will be noticed that these ports are graded in size and number, the object of which is to produce a perfect distribution of heat throughout the furnace. For this effect, the ports near to the smoke stack are made either larger or more numerous than near to the fire chambers.

All ports are placed at base of heating chambers, the natural course of flames and heated gases being to follow the arches, thus insuring an equal distribution of heat at base and top of annealing boxes, consequently there is a uniform result in ductility and color of sheets. The flames and heated gases passing from the fire chambers are conducted near the bottom of heating chambers, thus insuring a perfect heat.

The capacity of heating chambers, as shown in plan, is 20 boxes. The large sizes, requiring most heat, are placed in the chambers nearest the fire and the small sizes in the chambers nearest to smoke stack.

Points of Economy.—The first and last object of the inventor of this furnace was to economize labor and fuel without doing so at the expense of quality. In tin plate works of small capacity the effect would not be as noticeable as in a large plant. Yet it would, from the writer's point of view at least, save an amount of money equal to the superintendent's salary, if not considerably more. If only one small furnace of this design is used a system of overhead "telegraphs" is suggested from which pulley blocks, quick acting and steady, are suspended. This would not be as costly as the traveling crane, nor quite as effective. For large plants the traveling crane, which will serve either one or twenty furnaces, should be used. It is in the method of handling black plates from the sheers to the annealing house that the first saving is effected. There is no intermediate handling between the opener and the cold rolls, as the plates need not be disturbed until the latter point is reached, and so on through each process to the tinning house similar saving in labor is effected.

In the construction of the furnace but few castings are necessary and very little wrought iron work. The excavation need only be 4 feet deep, except at the ash pit, and the total hight of brick work is represented by the same figure. If the ground is packed tightly around the furnace and a good quality of fire brick used, repairs on the furnace will be very slight, and if packed with clay, the whole mass on the outside walls will bake solid. For a similar capacity of annealing boxes the cost of building this furnace is less than the old style.

On the point of cleanliness and keeping plates free from grit the method recommends itself, as the contents of boxes are not exposed in the dust and dirt of an annealing house.

In regard to fuel, the furnace will burn slack coal. The grate area of each fire chamber is 12 square feet, and is sufficient for 20 boxes. All heat is contained in the furnace, regulated at will, and not allowed to escape and heat the air. Hence the economy.

The foregoing description and illustrations of a recently invented furnace for annealing black plates in tin mills have now for the first time been published to the trade and are open for criticism. The columns of *The Metal Worker* are open to all who wish to avail themselves of opportunities to criticise existing methods or exchange ideas with other members of the trade, always with a view to placing the new American tin plate industry upon a footing that will enable it to compete successfully with the world.

SCRAP.

The United States Iron & Tin Plate Mfg. Company, Demmler, Pa., manufacturers of tin and terne plate, are operating their plant to full capacity and are disposing of their product about as fast as made. Right through the long period of business depression the above concern have been able by reason of demand of their customers to keep their tin plate plant in operation to nearly full capacity.

The Philadelphia Tin Plate Company is the name of a new concern recently established at Eighteenth street and Washington avenue, Philadelphia. They have put in a plant consisting of three Phillips' improved tinning machines, and will make additions as their business grows. They are at present making both bright and roofing plates, but propose shortly to add to their line an extra coated plate. They are conveniently located for business and start out in good shape. In a circular just issued to the trade they say: "Our purpose is to make plates of a standard grade, and not to sacrifice the quality for a slight saving in cost of manufacture."

The Duquesne Tin Plate Works, Soho, Pittsburgh, Pa., are reported as running double turn with a full force of work people, having sufficient orders on hand to keep the plant busy for some weeks.

The Black Diamond Tin Plate Works, Philadelphia, are reported in operation, turning out both bright and terne plates. Temple & Lockwood, 12 Platt street, New York, are their agents in this city.

James B. Scott & Co., Pittsburgh, Pa., send out a circular directing particular attention to Scott's Extra Coated and Triumph old style American roofing tin plate of their manufacture. This firm are sole factors for the Blairaville Rolling Mill & Tin Plate Company. Under the class of American roofing tin they refer to Duquesne and Neville brands, while notice is likewise made of the following bright tin plates of their manufacture: Blairaville Best Bright, Clifton and Conemaugh. All of the plates are briefly described. Among other things the circular announces: "Our brands are the product of a complete American plant consisting of hot and cold rolling mills, heating and annealing furnaces, pickling machine and tin houses."

Merchant & Co., Incorporated, Philadelphia, Pa., send out small circulars calling attention to their continuous tin for roofing, which is described as well coated. Each sheet is 8 feet long and the rolls contain 100 square feet.

Since the McKinley duty on pig tin went into effect seven months ago about 1376 tons of the metal have been landed in the United States, the greater portion of which remains in bond. There are afloat for this country 935 tons. Shipments of tin from the Straits during January aggregated 3925 tons, against 4000 tons during the corresponding month of last year. This includes 2675 tons to Great Britain and America and 1250 tons to Continental Europe.

"Penny-in-the-Slot" Gas Meters.

The "penny-in-the-slot" gas meters recently introduced in England do not appear to have worked uniformly to advantage, judging from the recent remarks of Vulcan in the London *Ironmonger*. He says: Like some other automatic machines, the "penny in-the-slot" gas meter is not without its faults. A well-known Lancashire justice thought he would like to see how one would work, and deposited a penny in the slot, but the meter—perhaps out of "pure cussedness"—would not act until three other pennies had been placed in its interior. These meters can be generous when they like. Witness one in the house of a poor widow which, for the payment of 1 penny, permitted the user to have gas to the value of 3 shillings and 6 pence. There was an unfortunate sequel to this experience, however, as the gas company demanded payment for the excess, and the widow being too poor to pay steps were taken to sell her furniture. In some towns difficulties of this kind are overcome by the gas department requiring the consumer to make a deposit of £1 or get the guarantee of a responsible householder. The drawback to this is that it drives people of poor circumstances to use oil lamps. Evidently there is room for improvement in the construction of automatic meters.

A meeting of the stockholders of the American Wringer Company was held at Woonsocket, R. I., on the 23d ult., at which Joseph Banigan was reelected president, George Reuter, Jr., treasurer and general manager, and Walter S. Ballou, secretary. The annual report of the treasurer showed the net earnings for the year 1893 to have been $202,011.37; dividends paid, $95,750; leaving a surplus of $106,261 37 for the year, with a total surplus of $238,860.63.

The Haish Manual Training School, at University Place, a suburb of Lincoln, Neb., was burnt down on January 29. The building was an adjunct of the Wesleyan University and was a gift from Jacob Haish of De Kalb, Ill., to the Methodists of the State of Nebraska. It was completed two years ago at a cost of over $60,000, and not a cent of insurance was carried. The loss of the building and the valuable machinery it contained is, therefore, complete, and will prove a serious setback to the manual training work of the university.

Aluminum cooking utensils are beginning to make their appearance in the up-town store windows in New York City.

S. Theodore Mertwage, naval *attaché* to the Russian Legation at Washington, has been visiting Pittsburgh to inspect the manufacture of gun projectiles. It is rumored that the Czar's Government is likely to place some heavy orders for naval supplies in this country before long.

PLUMBING and GAS FITTING.

Domestic Electrical Work.*—IX.

By W. A. W.

Electric Gas Lighting.

Electric gas lighting may be divided into three distinct systems—pendant, automatic and multiple lighting—the latter, however, being used principally in public buildings. Before proceeding to plan the various circuits for lighting gas by the electric spark in a dwelling house, it is a very good plan to thoroughly inform a customer of the various devices on the market, taking time to minutely describe their operation, in order that he may choose intelligently. If these preliminaries were always attended to as they should be there would be less occasion for owners to complainingly remark: "If you had called my attention to this or that device in time I should have liked it much better." This should not be so. By taking the time to inform a customer of every possible convenience at his command profitable sales can frequently be made where least expected.

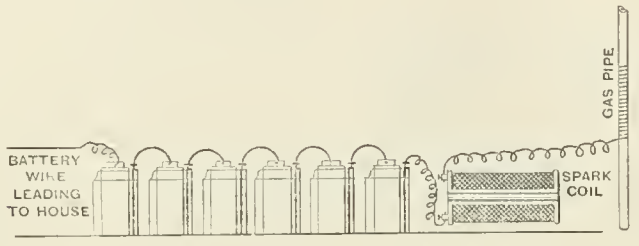

Fig. 17.—Battery and Spark Coil.

In dwelling houses the pendant and automatic systems are used. The pendant system consists of a gas burner having a ratchet and pawl to operate the gas cock, to which is also attached the movable electrode and chain for operating it. At the tip, and in line with the gas flame, is the fixed electrode, insulated from the burner and connected with the battery wire. The gas cock is so arranged that on pulling the chain the gas is turned on; at the same time the wipe spring or movable electrode comes in contact with the platinum point of the fixed electrode, along which it moves with a sliding motion until the end slips off, throwing a spark which ignites the gas. The next pull of the chain turns off the gas. Thus every alternate pull of the chain lights or extinguishes.

The automatic system consist of a burner provided with an electro magnet which operates the cock, turning on the gas and also lighing it at the same instant by simply touching a push button located at any distance from the burner. This feature makes the automatic particularly desirable for halls, basements and bedrooms. By its use a system may be so arranged that a person can visit any portion of the house at night and light the gas ahead and extinguish it in rear of him. For instance, an automatic burner may be placed in the basement, with the push located at the head of the cellar stairway. A person wishing to go down simply touches the button and the gas is turned on and lighted down below; on returning the same operation extinguishes it. In all houses having a hall an automatic should be located downstairs and upstairs, and another in the family chamber. The location of the push buttons should be well studied in order to place them at the most convenient points. No fixed rule can be laid down for this, as the style and arrangement of houses varies indefinitely, and each case must be planned according to its own requirements. The following suggestions, however, are offered in order to give some idea how this may be accomplished: A push button should be located near the front outside door, connected to the burner in hall downstairs, thus enabling a person on entering or leaving the house to light or extinguish the gas from that point. A double push button may be located near the parlor or sitting room door leading into the hall—one button connected with the downstairs burner, the other with the burner upstairs, so that either of these burners is under full control to light or extinguish from this point. A double push button should also be located conveniently near the head of the stairs connected to both of these burners. Another double push should be placed beside the door of the chamber and connected with the burner in the room and also with the upstairs hall burner. Another single push may be placed beside the bed connected with the burner in the room, so that that burner can be lighted or extinguished without rising. Thus it will be seen that a person before getting out of bed can light the gas in his room; on arriving at the door can light the gas in the hall and extinguish that in his room; on arriving at the head of the stairs can light the gas down below; from below he can extinguish the gas upstairs, and leaving the house by the front door a parting touch on the button located there will extinguish the last gas jet. In the same manner a person may enter the house in the dark, lighting his footsteps ahead of him without stopping to turn out the gas and groping his way in the dark to the next point. The number of push buttons connected to a burner may be multiplied to any extent to make the system more convenient.

Nearly all automatic electric gas burners are of similar construction and size, requiring two wires from the push button to burner, one to light and the other to extinguish them. An exception to these, however, is the Triumph single wire automatic. It differs from others in that but one wire is required from push button to burner. This burner is also fully one-third smaller than most others, and requires but a single push button while others require two. Every alternate push on the button lights or extinguishes it. While the automatic burner is almost indispensable where a perfect system is required, yet its use is practically limited to the purpose just described, as its general use in a house, aside from its cost and additional expense for wiring, would be undesirable.

For chandeliers and side lights generally the pendant burner is found the most convenient. In wiring for gas lighting it should be borne in mind that quite a considerable spark is to be kept within bounds, and due caution must therefore be exercised to see that the insulation is perfect where the wires run near any of the gas pipes. All splices should be soldered and covered with rubber tape. The wiring consists principally of what is termed a battery wire, starting from the basement and making a general circuit throughout the house, with branches running to

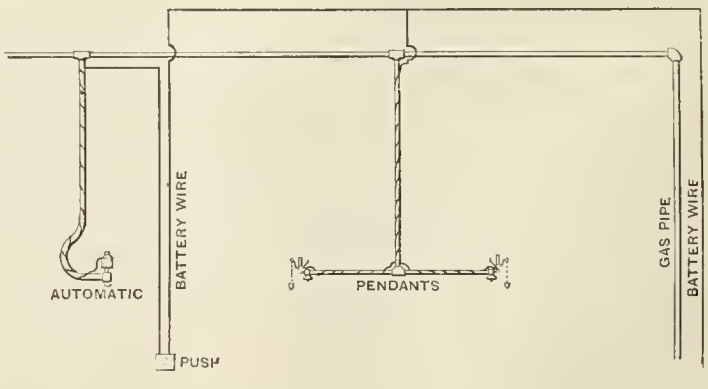

Fig. 18.—Wiring for Electric Gas Lighting.

*Copyrighted, 1893, by David Williams.

each fixture, except in the case of automatics, where the battery wire is run to the push button only.

The apparatus in the cellar consists of the battery (six cells connected in series) and a spark coil. Fig. 17 shows their arrangement. Fig. 18 shows the wiring for two pendants and one automatic burner. The battery wire from the house is connected to one pole of the battery. The other pole of the battery is connected to one binding post of the spark coil. From the other binding post on the spark coil a wire is run and connected to the gas pipe on the house side of the meter. The pipe should be filed bright and clean. About 3 feet of the wire should be scraped clean of the insulation and wrapped tightly around the pipe and soldered. Some advocate bridging over the meter with a wire, but this is all unnecessary, as we have nothing to do with the street side of the meter. The wire being connected with the same system of piping on which are located the burners to be operated, the pipes necessarily act as a return wire and we do not want a ground at all.

Proposed Code Regulating Apprentices.

To the officers and members of the Chicago Master Plumbers' Association and to the officers and members of the Chicago Journeymen Plumbers' Protective and Benevolent Association.

In order to systematize the methods by which apprentices may be regulated your joint committee recommend the adoption of the following :

APPRENTICESHIP CODE.

ARTICLE I.

Section 1. That there be an apprenticeship board composed of two members in good standing of the Master Plumbers' Association and two members in good standing of the Journeymen Plumbers' Association, and that in organizing they shall select as secretary of the board a member of the board who shall be a member of the Master Plumbers' Association.

Sec. 2. The president of each association shall be by virtue of his office an alternate member of the board.

Sec. 3 The members of the board, shall serve one year, or until their successors shall qualify. At the first election of board members one from each association shall be elected to serve one year and six months.

Sec. 4. The members of the board, the secretary excepted, shall be paid $3 for actual service at each meeting.

Sec. 5. The secretary of the board shall be paid a stated salary, as may be hereafter agreed upon by both associations.

Sec. 6. The board shall charge a nominal fee for examinations and for indenture and efficiency papers, the proceeds to be used in defraying the expenses of the board.

Sec. 7. The expenses of the board not otherwise provided for shall be borne by both associations.

ARTICLE II.

POWER OF THE BOARD.

Section 1. All apprentices shall be indentured through and be under the protection of the board, who shall see that all its rules are obeyed and that the apprentice once accepted has the opportunity to finish, at which time, if he passes the examination decided on by the board, he shall receive a certificate of efficiency from the board. If he fails at the first examination he shall be given the opportunity to appear again for examination at the future sittings of the board, providing three months have elapsed since his last examination.

Sec. 2. An agreement shall be entered into between the board and apprentices defining the responsibilities of both parties. The board's obligation shall not be of a financial nature.

ARTICLE III.

DUTIES OF THE EMPLOYER.

Section 1. Any employer obtaining or indenturing an apprentice through the board shall give a written guarantee to the board to furnish said apprentice with employment, together with every opportunity to learn the trade thoroughly under the board rules as long as he is able to keep the proportionate number of journeymen.

Sec. 2. Any employer who may consider his apprentice as unworthy or incompetent may have him brought before the board, who shall examine into the merits of the charges. Such disposition of the case as they may determine shall be final.

Sec. 3. The placing of apprentices with journeymen shall be at the discretion of the employer.

ARTICLE IV.

NUMBER OF APPRENTICES.

Section 1. This board shall estimate the number of apprentices as to journeymen in the proportion of one to three, and one for the majority of each succeeding three, with the exception that each shop may have one apprentice. When the number of apprentices in a shop shall be out of proportion to the above rule, the board, at its discretion, shall authorize the transfer of said apprentices to shops where the proportionate number of apprentices does not equal that provided for.

Sec. 2. Junior plumbers who may not be at work at the time of the formation of this board, upon being indentured shall be distributed equally among such shops as may desire them, provided such shops shall not receive them in such numbers as to make the number of apprentices exceed the number of journeymen.

Sec. 3. Master plumbers may have their own sons indentured, irrespective of the proportionate number of apprentices, and such son while in his father's employ shall not be considered one of the proportionate number of apprentices agreed upon.

ARTICLE V

APPLICATIONS.

Section 1. Any boy desiring to be indentured as an apprentice shall through his legal guardian make known such fact to the secretary of the board, who shall keep record of such application.

Sec. 2. Any master plumber desiring an apprentice shall make known such fact to the secretary of the board, who shall send to him the first applicant on the list for trial.

Sec. 3. Sons of master and journeymen plumbers shall have preference over all other applicants.

ARTICLE VI.

APPRENTICESHIP TERMS.

Section 1. The terms of apprenticeship shall be five years.

Sec. 2. The first three months shall be on probation, and if at the end of that time the probationer is accepted, the employer shall have him brought before the board and have him duly indentured; provided, however, that his conduct has been satisfactory to his employer and he cannot retain his services the full time of his probation the balance of the time shall be at the disposal and discretion of the board.

Sec. 3. The first three years shall be served as a helper; the last six months of this time may be at practical work if the employer so desires.

Sec. 4. The next two years shall be practical work, at the discretion of the employer.

ARTICLE VII.

EMERGENCY TERM.

Section 1. In determining the status of apprentices and junior plumbers who may be working at the trade at the date of the formation of the board, they shall certify to the board the name of the employer and the number of years they have been employed. The board shall then indenture them according to the number of years they have given proof of having served; provided that all so-called junior plumbers who may be working at such date, and who may be receiving as a weekly wage a sum less than that they would be entitled to under the board's rules of service, shall be placed in that term of apprenticeship the wage of which is next below the rate they are receiving, and the board shall determine when such year of apprenticeship will cease.

Sec. 2. All so-called junior plumbers who may not be at work at the date of the formation of this board shall be placed in the same grade and under the same conditions as if they were at work and were receiving for such work the weekly wages that they last received continuously for a period of three months.

ARTICLE IX.

EMERGENCY WAGES.

Section 1. All so called junior plumbers who may be working at the trade at the date of the formation of this board, and who may be receiving a weekly wage at variance with the board schedule, shall continue to receive such wage until such time as they would be entitled to an increase under the rules of service of the board.

ARTICLE X.

STRIKES.

Section 1. In case of strikes or lockouts, boys indentured by this board who previous to its formation had not served as junior plumbers shall be under the direction of the employers, subject to article VI.

ARTICLE XI.

SHOP RULE.

Section 1. No journeyman shall work in a shop where the apprentices are not indentured by this board.

Sec. 2. No master plumber shall keep in his employ any apprentice unless indentured by this board.

ARTICLE XII.

AMENDMENTS.

Section 1. The board shall from time to time suggest such amendments to the code as they may deem advisable, and such amendments shall become part of the code when ratified by both associations.

MUTUAL AGREEMENT.

This code shall go into effect on the date of the ratification by both associations of the details to be drawn up in conformity with it.

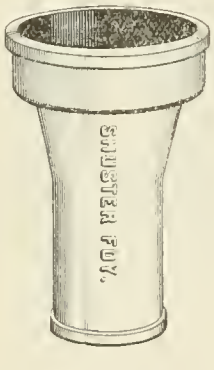
Respectfully submitted,

JAMES H. ROCHE, C. J. HERBERT, JOS J. BREEN, ALEX J MURRAY,	Master Plumbers' Committee.
EDWIN S. MARSH, JOSEPH ALLCOCK, JOHN J. DWYER, JOHN J. MEANY, C. DESORMEAUX,	Journeymen Plumbers' Committee.

Criticisms regarding the above code are invited by the committees, and can be sent to the office of the secretary, Alex. W. Murray, 197 Madison street, Chicago.

Increaser for Terra Cotta Pipe Connection.

The illustration herewith is of a fitting for connecting terra cotta pipe with iron pipe, lately introduced by the Shuster Foundry of Franklin and Willow streets, Philadelphia, and South



Increaser for Terra Cotta Pipe Connection.

Pittsburg, Tenn. It has been designed to meet the objections of many plumbers to the fittings at present in use for this purpose, and which, it is complained, are mostly of insufficient length outside of the taper to allow of proper calking, or have the reducing principle contained in a shoulder, naturally presenting an opportunity for lodgment of sewage matter. It will be noticed that there is in this fitting ample length outside the taper to allow of easy and perfect calking of the joint, and that the shape of the bell presents no opportunity for the lodgment of matter likely to cause an obstruction. The fitting is made for 4-inch, 5-inch and 6-inch iron pipe connection, and the bell is sufficiently large to take terra cotta pipe of the same inside diameter.

Inspector Ford's Address.

On invitation, William A. Ford, the new plumbing inspector of Cambridge, Mass., made an address before the Master Plumbers' Association, explaining that by the law of 1893 it was mandatory for towns of 5000 inhabitants to provide for the licensing of plumbers and the regulation of their work. In discussing the ordinance which the city promptly passed, he remarked that in general its provisions are understood.

The details of the ordinance may in a general way be said to demand a drainage system constructed of cast iron pipes of standard weight, joined together in the usual way, carried through the roof, with the necessary trap at the sewer end, and the whole put together in a manner to be impervious and tight. The introduction of the "fresh air vent" is left optional, as recent observations lead many to believe that under low barometric conditions this vent is dangerous. The evidence is rather obscure, certainly not sufficient to warrant its total exclusion. We leave it an open question.

We demand all fixtures to be separately trapped, with this exception: "One bowl and one washtub or one set of trays and one sink may be served by one trap, provided the distance between them is not greater than 2 feet." I am not prepared to indorse even this exception, still there is no strong objection, and the exactness of the limitations surrounding its use will prevent any abuse. All traps, wherever and however located, without exception as to form or design, must be protected from atmospheric influences by such vent pipes of the material, and constructed in a manner prescribed in this ordinance. This rule is without exception and absolute. I am aware that under certain circumstances ex ception to this rule is advocated. As plumbers we are all aware that under some conditions in location and design of traps, the liability of syphonage will range from the highly probable to the reasonably improbable.

I am sure that no man who values his opinion, certainly no man who is publicly responsible for it, would willingly decide that any particular trap, placed in any particular location, would or would not be liable to be affected by syponage. All work not in the strictest sense a mere repair of a leak must in every case come under the operation of the ordinance. An application will be required, a permit issued and an inspection will follow. This is very important, that power to do work aside from the terms of the ordinance must be very limited. To give to designing men any latitude under the specious guise of "repairing leaks" would lead to extensive violations of the ordinance, equally as damaging to the purposes of the department which I represent and to your interests as honest plumbers.

After going over the plan perfected for the issuing of permits and other details of the department, he made the following remarks in closing:

And now, gentlemen plumbers, we ask your co-operation. That there are minor hardships is undeniable, but probably not more so than in other rules of law. These laws are created to meet general conditions and cannot be bent to meet individual cases. We are willing to meet criticism. Do not make it a "carping" one. This law is for your protection as well as in the interest of the public health. It establishes a uniform standard of work. You are enabled to know the conditions under which you all must do business. It relieves you from the importunities of the penurious. It protects the honorable business man from the empiric. It protects the skilled journeyman from the "half backed" helper; and last, but not least, those that are too willing to prostitute the considerations of health and safety to their instincts of pecuniary gain may be protected against themselves.

TRAPS AND VENTS.

M. C. COSTELLO AND GRANT E. SMITH have formed a partnership in the plumbing business and rented the store 213 West Water street, Elmira, N. Y.

AT A RECENT MEETING of the Council of Jersey City, N. J., plumbers' licenses were granted to John J. Duff, Valentine Ringle, Richard Heatherton, Charles A. Ormsby, P. H. May, to make connections with the water mains of Jersey City, and also to do general plumbing work, when they file the required bonds in the office of the Permit Clerk.

WM. MCKEY will erect at Forty-first street and Grand boulevard, Chicago, Ill., a four story and basement apartment house, at a cost of $25,000, which will be heated by steam.

SEVERAL PLUMBERS were recently fined in the Recorder's Court at Savannah, Ga., for working without a license.

THE ANDREW J. ROGERS COMPANY, Paterson, N. J., have filed a certificate of incorporation with the County Clerk. They will carry on the plumbing and tinning business.

WILLIAM H. KAVANAUGH & CO., Buffalo, N. Y., general plumbers, have certified to the County Clerk the dissolution of the firm's partnership.

FREDERICK HELLER, a New Jersey plumber living at Caldwell, has increased the speed that he was able to attain on his bicycle by adapting the twin screw propeller and attaching it to the frame. Power is transmitted from drums on the axle through belts, and, though not a fast rider, by its aid he has been able to pass his old competitors. A patent on the appliance has been applied for.

The Metal Worker has received from Secretary Wm. G. Wacker of the Master Plumbers' Association of Toledo, Ohio, the following invitation, which will also be received by the plumbers of Ohio: "You are cordially invited to attend the annual convention of the Ohio State Association of Master Plumbers, to be held in this city February 13 and 14, 1894. Headquarters at Boody House; convention at Memorial Hall."

THE FIRM OF HITCHCOCK & BLANCHARD, Palmer, Mass., who made a business of plumbing and heating work, have been dissolved by the expiration of the contract between the two members, and Mr. Hitchcock will continue the business at the old stand on Central street.

A DISPATCH from Lynn, Mass., reports that a fire which broke out in the Osborne Block, Market Square, in that city, on January 29, damaged Wiley's plumbing store to the extent of $1000.

NOTICE OF THE DISSOLUTION of the limited partnership of William H. Kavanagh & Co, Buffalo, N. Y., plumbers and gas fitters, was filed in the County Clerk's office recently. The firm was composed of W. H. Kavanagh and George Parks.

PRESIDENT DANIEL G. FINNERTY of the National Association of Master Plumbers and State vice-president of Maine John B. Smith of Lewiston held a meeting at Bangor on January 22, at Augusta on the 23d, at Lewiston on the 24th, and at Portland on the 25th, and were successful in organizing

temporary associations of master plumbers. At each city representatives from adjacent cities were present and a strong State association is expected to be the outcome, as 50 representatives were present at the different points, and were impressed with the benefits that arise from a closer acquaintance and co-operation.

THE FIRM OF ROBINSON & LANGDON, plumbers, on Pearl street, Hartford, Conn., has been dissolved The business will be conducted by Thomas H. Langdon.

THE FIRM OF MERRICK & DONALDSON, plumbers, of New Brighton, Pa., have dissolved partnership by the purchase by Mr. Merrick of Mr. Donaldson's interest. Mr. Donaldson, so it is reported, will open another shop.

THE MASTER PLUMBERS' ASSOCIATION of Grand Rapids, Mich., has elected the following officers for the ensuing year: President, W. T. McGurrin; vice president, A. M. McPhail; secretary, W. C. Weatherly; treasurer, Fred Shriver, Sr.; sergeant at arms, Benj. Powers.

J. F. THOMPSON, J. A. Waugh and Wm. Meinhardt of Duluth, Minn., have filed articles of incorporation for the formation of the Thompson-Waugh Company, with a capital of $10,000, for the transaction of a plumbing, heating and gas fitting business.

WM MORAN, 24 Diamond street, Titusville, Pa., is a plumber who appreciates the value of an up to date showroom displaying modern plumbing and gas fixtures. He is agent for the Joy boilers and radiators, and makes a specialty of heating and ventilation.

WE HAVE TO RECORD the death, on the 12th inst., of Thos. Casey, the secretary and treasurer of the McCambridge Company, Limited, of Philadelphia, manufacturers of plumbers' supplies. Mr. Casey had been identified with the business of the house for upward of 25 years, and at the time of his death was senior member of the company. He was well known to the trade in Philadelphia and held in great esteem by his associates in business and all with whom he came in contact in a business way. Many plumbers in the city of Philadelphia have lost in him a friend who was always ready to lend his assistance in a time of need, and many instances are recorded of his open handed generosity and good heartedness. Mr. Casey was 66 years old. The cause of his death was apoplexy.

J. F. CRINKLAW having purchased the interest of Mr. Burgess in the establishment of Berg & Burgess, under 19 West Main street, Marshalltown, Iowa, the new firm of Berg & Crinklaw will hereafter continue the business at the old stand.

SUPERINTENDENT BELKNAP of the Board of Health of Rochester, N. Y, announces that he is now ready to register plumbers and issue certificates to them. This is in accordance with the provisions of a State law. The plumbers must also secure licenses from the Executive Board.

NOTICE IS ISSUED from St. Paul, Minn., under date of January 26, that the partnership of Michel, McDonough & Bowers has been dissolved by mutual consent, Joseph Michel retiring from the business. James T. McDonough and William L. Bowers will continue the business under the firm name of McDonough & Bowers.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

MANDEL BROS. will erect a four-story apartment house 60 x 66 feet, costing $35,000, and heated with steam, at Thirty-seventh street and Rhodes avenue, Chicago, Ill.

HENRY V. PIERPONT has the contract to erect for Henry Ives Cobb, a four-story apartment house at the corner of Evanston and Barry avenues, Chicago, Ill. It will cost $78,000 and will be heated by steam.

J. C. GRIFFIN, Chicago, will erect a four-story apartment house at Forty-eighth street and Indiana avenue, costing $40,000, to be heated with steam.

C. B. MCLACHLIN will build a three-story apartment house, 40 x 85 feet, at a cost of $25,000, to be heated by steam, at Sixty-fifth and Wright streets, Chicago, Ill.

THE CONTRACT for finishing the interior of the Government Building, at Lewiston, Maine, and for the plumbing has been awarded to M. C. Foster & Co. of Waterville. Their bid was $18,-990.

THE JOHNSON ELECTRIC SERVICE COMPANY, Milwaukee, Wis., have been awarded the contract for installing the Johnson heat regulating apparatus in the new almshouse building at Wauwatosa. Their bid was $3987.

BIDS WILL BE RECEIVED by the Board of Education of Brooklyn, N. Y., up to February 6, for the plumbing and gas fitting for the boys' High School, corner Marcy and Putnam avenues.

THE STEAM FITTING for Company F Armory and the new hospital addition, now nearing completion, at Santa Monica, Cal., is the work of the subcontractors, Stevens & Stewart, who planned and executed the entire steam system of the Bradbury Block, Los Angeles, which is considered a fine piece of work.

THE BARRON STEAM HEATING COMPANY, 43 Dey street, New York, are using Bronson's steam boilers and Kensington radiators in two apartment houses at Eighty fourth street and Ninth avenue, New York.

GEORGE GATES, Nyack, N. Y., recently installed a No. 224 seven-section Richmond steam heater in the residence of Mrs. Wilcox.

AMONG THE CONTRACTS lately taken by the J. L. Mott Iron Works, 311 and 313 Wabash avenue, Chicago, can be mentioned the following: Combination warm air and hot water heater in residence of Alex. Chytrans, Arlington place; Mott's Comet warm air furnace in residence of Martin Anderson, Maplewood avenue, between Potomac and Hirsch streets; Mott's Star warm air furnace in residence of C. W. Mills, Bowen and Langley avenues.

THE ILLINOIS HEATING COMPANY, 88 Lake street, Chicago, have taken contracts for hot water heating in the following buildings: Residences of Henry Neurmberger and Fred. E. Cure, Indiana avenue, near Fifty-ninth street; residence of C. Ohm, 506 Belden avenue; apartment building of Paul Jaeshke, 72 Center street; residence of Wm. Hoyt, Englewood, and residence of E. C. Bates, 562 Boulevard place.

E. BAGGOT, 169 and 171 Adams street, Chicago, is to supply the plumbing and gas fitting in the residence of Alex. Ross, 1849 Barry avenue; the 19 flat buildings of Frank J. Urston, 3554 Cottage Grove avenue, and the St. Nicholas Hotel, St. Louis.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until February 20 for the plumbing and sewer connection at the United States Post Office, &c., building at Vicksburg, Miss. Drawings and specifications may be had from the Supervising Architect, Washington, or from the office of the custodian at Vicksburg.

THE WALCOTT-HURLBUT COMPANY, 175 and 177 Lake street, Chicago, are to furnish for the Newberry apartment building, corner State and Oak streets, 40 Princess enameled baths, 40 Mælstrom syphon jet closets, 40 lavatories with Puritan enameled basins and 40 Economy laundry tubs. The plumbing work is to be done by the Wells & Newton Company, 1108-1109 Monadnock Block.

THE L. H. PRENTICE COMPANY, 203 and 205 Van Buren street, Chicago, are to furnish the steam heating plant in the residence of Byron L. Smith, Lake Forest, Ill.

BUROIN BROS., Springfield, Mass., will use the Fuller & Warren Company's hot water apparatus to heat an apartment house being erected in that city.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until March 7 for the low pressure return circulation steam heating and ventilating apparatus for the United States Post Office building at San José, Cal. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the office of the superintendent at San José.

THE AUTHORITIES of Glenn County, Cal., have let a contract for building a court house at Willows to cost $76,-497. In addition to that sum $5600 will be paid for a hot air heating and ventilating system.

A. B. WILKINSON, West Haven, Conn., has been awarded the contract for plumbing and heating the new Samoset Club house.

SEALED PROPOSALS will be received at the office of the Supervising Architect, at Washington, D. C., until February 21 for the plumbing and gas piping for the United States Post Office building, Lowell, Mass. Drawings and specifications may be obtained from the Supervising Architect, Washington, or at the office of the superintendent at Lowell, Mass.

THE AUBURN STEAM BOILERS made by F. W. Wright, 6 Bridge street, New York, were recently used by Geo. H. Murphy, Bound Brook, N. J., in heating the residences of Wm. Koetchlein and architect and builder Geo. Stryker, where he also erected the plumbing system. He used a special system of return mains in the heating plants.

W. FRANK B. FISHER, Springfield, Ohio, sends us an advertising postal card that ought to bring him no little trade. It begins by addressing an imaginary customer, asking him if he is going to build or have any repairs done, &c. Then Mr. Fisher proceeds to tell about five grades of work which he does. If it is necessary to do a cheap job he will do it, but it will not give general satisfaction. Then he does a good, a guaranteed, a reliable and extra quality work, the grades in each case being described. Mr. Fisher's specialty is spouting, roofing, valleys, repairing, &c.

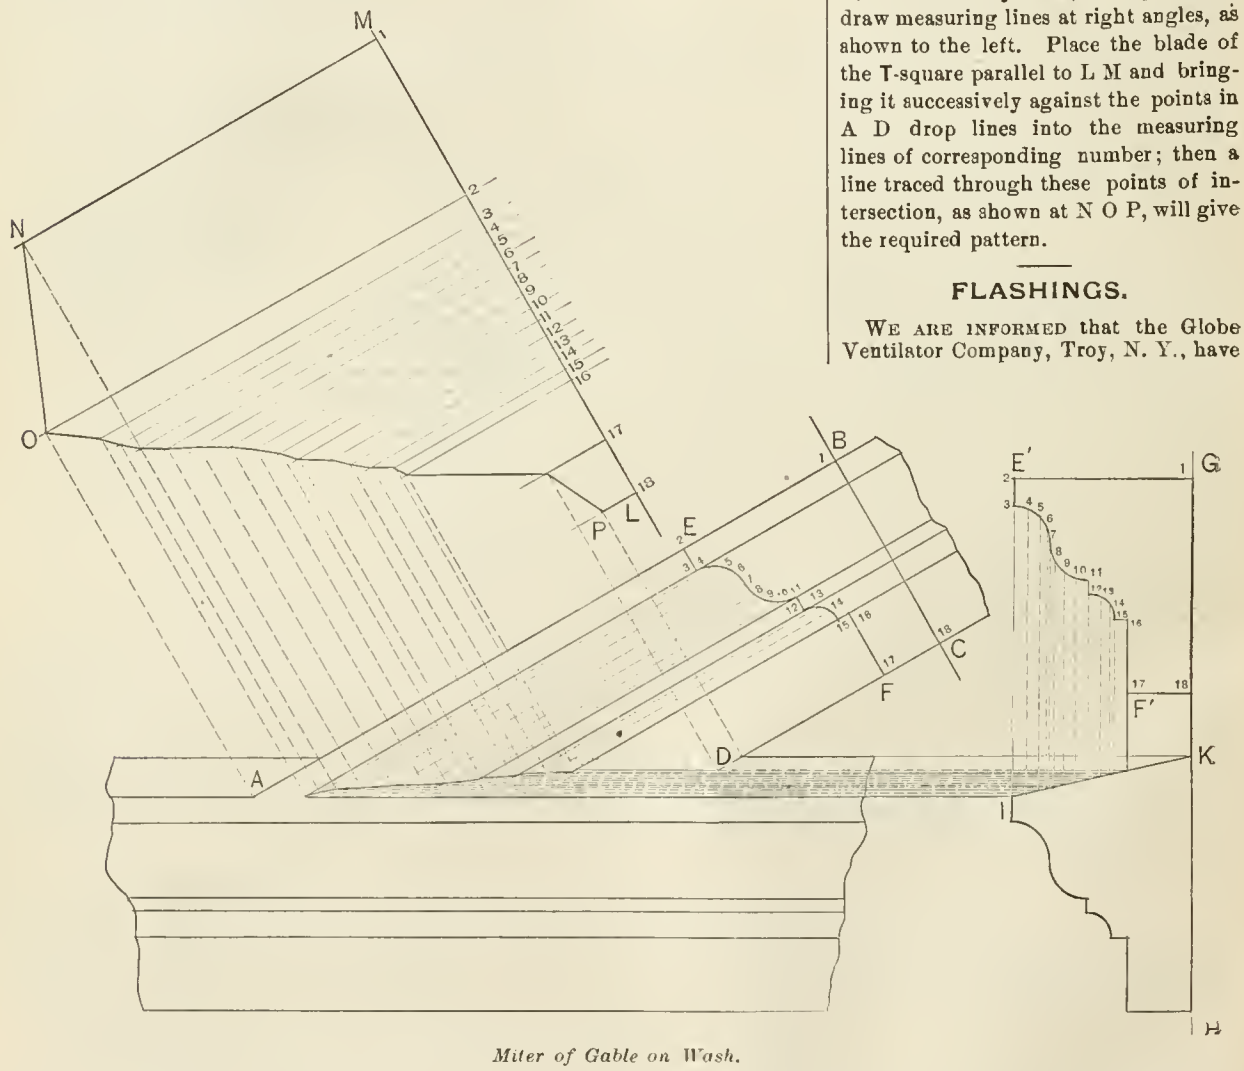
ROOFING AND CORNICE.

Miter of Gable on Wash.

From J. F., *Savannah, Ga.*—Please explain to me through *The Metal Worker* how to obtain the pattern for a gable mitering on a wash, as indicated in the inclosed sketch. I have looked for the problem in books on sheet metal work, but have not found it.

Answer.—In the original compilation of *The Metal Worker* pattern book this particular problem was not included, although its principles are involved in the solution of those problems relating to the mitering of hip moldings of a mansard roof down upon a wash at its base. Our correspondent's sketch has not been reproduced exactly, but its essential feature is embodied in the illustration, which treats the problem in its simplest form.

Let A B C D be the front elevation of the foot of a gable molding mitering down upon an inclined wash forming the top of a level cornice below said gable—a feature of design of quite frequent occurrence. E F shows the profile and its projection from the wall B C. It will first be necessary to construct a sectional view, as shown at the right of the elevation, in which G H represents the face of the wall and K I H the profile of the level cornice of which I K is the wash upon which the gable mold is required to miter. Place a duplicate of the profile of the gable molding E F at any convenient distance above the section, as shown by E' F', keeping the projection E' G equal to E B. Before the miter pattern can be developed it will be necessary to obtain a correct view of the miter in elevation, as shown from A to D. To accomplish this divide both profiles of the gable mold into the same number of spaces as shown by the small figures 1 to 18 in each. From the points in the profile E F carry lines parallel with the pitch of the gable indefinitely toward the foot of the molding. From the points in the profile E' F' drop lines vertically, intersecting the wash I K, as shown. From the points of intersection in I K carry lines horizontally to the left, intersecting them with the lines of corresponding number drawn from E F. A line traced through the points of intersection will complete the elevation, but is not in itself really necessary, as the miter pattern is developed by lines projected from these points of intersection. Upon any line drawn at right angles to A B lay off a stretchout of the profile B E F C, as shown by L M, through which draw measuring lines at right angles, as shown to the left. Place the blade of the T-square parallel to L M and bringing it successively against the points in A D drop lines into the measuring lines of corresponding number; then a line traced through these points of intersection, as shown at N O P, will give the required pattern.



Miter of Gable on Wash.

FLASHINGS.

We are informed that the Globe Ventilator Company, Troy, N. Y., have furnished two of their 60 inch Globe ventilators for the new opera house at Oswego, N. Y.

L. D. Berger, 224 Arch street, Philadelphia, Pa., is sending out to the trade a calendar for the current year. The upper part of the poster calendar contains a business announcement of Mr. Berger, who is a manufacturer of tinners' and roofers' supplies, besides being a dealer in tin plate, registers, &c. At one side of the announcement is an engraving of Mr. Berger's place of business on Arch street. An unusual feature of the cal-

endar is that the days of the month appear in white upon a black background. They are in this way made very clear and conspicuous.

GEO. C. KEENE & Co., Cincinnati, Ohio, report the shipment of an entire carload of iron roofing machinery to the Cambridge Roofing Company, Cambridge, Ohio, last week; an 8-foot flanging machine to the Michigan Stove Company, Detroit, Mich., and numerous other machines to Chicago and other points.

THE COPPER WORK AND CORNICES on the St. Luke's M. E Church at Long Branch, N. J., were recently completed by J. F. Stephenson of Lakewood.

A LARGE ADVERTISING SHEET is issued by Berger Brothers, 237 Arch street, Philadelphia, Pa., addressed to architects and builders, and also to wholesale dealers. The sheet shows two views of the handsome residence, Fairview, of W. H. Berger, at Wyncote, Pa., which is equipped with Berger's hangers. There are several other illustrations on the sheet showing the new and old fashioned gutters, and a number of illustrations are presented of Berger's pipe fasteners.

THE TWELFTH ANNUAL MEETING of the stockholders of the Cambridge Roofing Company, Cambridge, Ohio, was held January 6, attendance being full. Considering the extraordinary conditions of the past year a satisfactory report was presented. The old Board of Directors was re-elected, with A. W. Nicholson as president and S. W. Nicholson as secretary and treasurer. W. C. Cowgill will continue to represent this company on the road. The Chattanooga branch manufactory of this company is now owned and operated by the Chattanooga Steel Roofing Company, Chattanooga, Tenn., under the general management of J. E. Annis, formerly of Cambridge, Ohio.

JAMES BUCKLEY and J. L PERKINS have formed a copartnership under the name of Buckley, Perkins & Co., and have secured a commodious salesroom at 243 Lake street, Chicago. The firm will carry a full line of tin plate, galvanized sheet iron, steel roofing, corrugated iron, conductor pipe, eave trough, roofers', tinners' and cornice makers' supplies. Mr. Buckley has been with the "C. H. B." Sheet Milling Company for the past seven years, and is well known to the trade. Mr. Perkins has been connected with the sheet mill trade for the past 12 years, and for two years was manager of the Illinois Roofing & Supply Company.

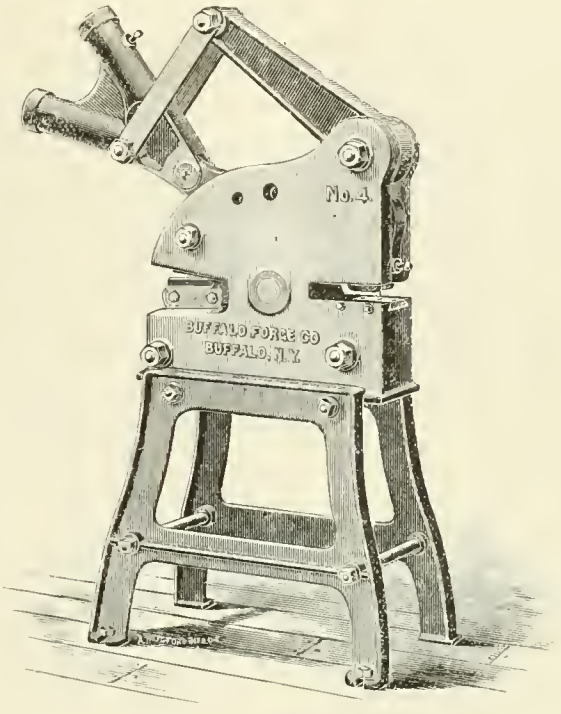
AMONG NEW CONCERNS recently incorporated at Albany, N. Y., is the Paradigm Construction Company of New York, to manufacture skylights, glass and metal roofs, &c., with a capital of $10,000. The directors are Arthur E. Rendle, Seymour P. Thomas and David W. Sisson, New York City.

THE WHEELING CORRUGATING COMPANY of Wheeling, W. Va., have opened a warehouse at 472 Laflin street, Chicago, where they will carry a complete stock of corrugated iron, steel roofing, steel siding and steel ceiling, galvanized steel eave trough and conductor, black and galvanized sheet iron and steel. The location of this warehouse is excellent and will insure quick deliveries.

A PRESS DISPATCH from St. Louis, Mo., states that owing to a reduction in wages about 200 employees of the St. Louis Roofing Company went on strike February 1.

The Buffalo Punch, Shear and Bar Cutter.

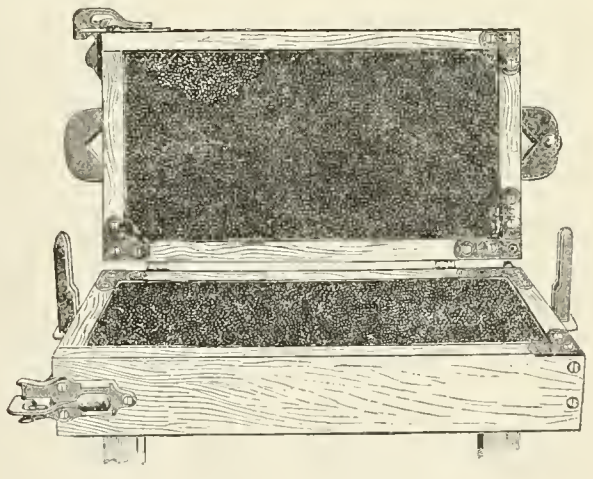
The construction of this machine is such that the operator can use it without a helper on the heaviest work. No adjusting is required in changing the work, the machine being always ready for performing any of its three functions of punching, shearing or bar cutting. The mechanism consists, as will be seen, in a combination of levers, so arranged that the cutting is done up from the bottom. The machine is built in four sizes by the Buffalo Forge Company of Buffalo, N. Y. Capacity No. 1 will shear ½-inch strap iron 1½ inches wide, will punch ½ inch in ⅝ inch iron and cut off ⅝ inch. Capacity No. 2 will shear ⅝-inch strap iron 2 inches wide, will punch ¾ inch in ¾-inch iron and cut off ¾ inch. Capacity No. 3 will shear ¾ inch strap iron 3 inches wide, will punch ⅞ inch in ⅞-inch iron and cut off 1 inch. Capacity No. 4 will shear ⅞-inch strap iron 3 inches wide, will punch 1 inch in 1-inch iron and cut off 1¼ inches.



THE BUFFALO PUNCH, SHEAR AND BAR CUTTER.

The Diamond Snap Flask.

The Diamond Clamp & Flask Works of Richmond, Ind., manufacture a flask which is put together by templets so that the parts are interchangeable. The flask is operated in the same way as other snap flasks with these exceptions: Instead of unlatching one part at a time, in the ordinary way, both parts are unlatched at one operation. Closing the two parts latches them ready for another mold. The construction of the flask is clearly shown in the engraving.



THE DIAMOND SNAP FLASK.

It has been decided by the committee appointed to settle the site of the French Exposition of 1900 that the great fair shall be held in Paris itself. It is to occupy the Champs de Mars, the Trocadero, the Esplanade des Invalides, the Quai D'Orsay, the Palace of Industry and the surrounding ground. A special bridge is to be constructed for the occasion over the Seine, the main entrance to the exhibition being on the Place de la Concorde.

STEAM AND HOT WATER.

The Velocity of Circulation in a Water Warming System.

BY KNIGHT.

The dominant principles and general detail connected with a hot water circulation are, without doubt, fully recognized and understood by the trade at large. There would seem to be, however, some few of the minor questions with regard to the circulation upon which general opinion differs widely. It would be hard to decide just when and why such differences occur or why the differences should be so exaggerated. There is one question in particular which seems to be shrouded in considerable mystery and concerning which there appears to be little or no exact information. This question is in relation to the velocity with which the water in a warming apparatus circulates in the pipes and radiators. The writer has in mind at this writing a case which was brought up in a court in Massachusetts where the decision turned on what was to be considered a proper circulation in the pipes and radiators of a warming apparatus. To settle the question, the services of two engineers were secured who discussed at considerable length this matter of the velocity of flow, but were unable to give information in this regard sufficiently definite to be accepted by the court.

Varying Velocities.

The popular idea with regard to the velocity is in favor of a velocity which is so slow as to be almost imperceptible. While opinions on this subject vary from the idea of an imperceptible current to a velocity approaching that to be observed in the water flowing from the nozzle of an ordinary hose pipe under a head of 50 or 60 pounds, the matter of determining the exact velocity under any given conditions, as a matter of fact, does not present any extreme difficulty. The truth of the matter is that the velocity of the circulation in the water in any apparatus varies at different times, and also varies in the different mains and branches of the system. The reasons for this are clearly apparent, when it is borne in mind that the circulation is dependent upon the cooling which the water undergoes in the return pipes and radiators.

Now, if any one part or branch of a system is at any given time doing more work, or in other words, undergoing a greater cooling effect than another part of the same system, it will be necessary that there be supplied to the part doing the most work the greatest amount of water. The velocities in a system may not, necessarily, differ to any great extent at any given time, but still a careful consideration of the conditions which govern the flow would show that it would be seldom that such velocities in the different parts of the apparatus would be identical. As the circulation, however, is dependent upon the cooling effect, the velocity with which the current flows to and from the radiating surface is a feature which, to a certain extent, increases and diminishes according as the work to be done increases or diminishes. If a radiator is doing an amount of work which requires that there be flowed to it a certain number of pounds of water per hour, the velocity with which the water flows in the supply mains is governed to a large extent by the size of the pipe connection. That is to say, a radiator requires a certain amount of water. If the connections to a radiator are small, that amount of water must be passed through at a greater velocity than would have to be maintained in supplying the same amount through a pipe of large internal area. As the cooling effect sustained by the radiating surface, or in other words, the work to be done, is the determining factor in the amount of water to be supplied, it would follow that we may disregard the size of the supply pipes within certain limits, always remembering that the larger pipe is preferable in a choice of two sizes, inasmuch as it permits a lower velocity and a consequent lessening of the friction.

A Practical Example.

To obtain a proper consideration of this question let us assume for the moment that we have in a room a radiator of 80 square feet of radiating surface. For one hour this radiator maintains a temperature of 72° F. in the room. We will assume, for the purpose of illustration, that the radiator holds 125 pounds of water, and is supplied by a 1½-inch pipe, with a corresponding size for the return. The water, we find by applying thermometers to the supply and return pipes, is 195° F. when it enters the radiator and is 180° F. in the return pipes. The point we wish to arrive at is: How many times that radiator, under the given conditions, will empty itself in an hour, and knowing that and the size of the supply pipe, we can readily determine with what velocity the water must have flowed to meet these demands.

Our assumption at starting was that this radiator was to maintain a temperature of 72° F. in the room for one hour. By maintaining the temperature in the room at 72° we must necessarily have brought into the room through the radiator as many units of heat as have been lost to the room through the walls, windows and other exposures In any case, the gains fully equaled the losses, otherwise the temperature would not have been maintained. Now, it has been proved by experiment that there will be given out from 1 foot of radiating surface about 2 units of heat per hour per degree difference in temperature between the radiating and receiving surfaces or bodies. In the present instance if the supply water is 195° and the return water 180° the mean temperature of the radiating surface would be 187½° F., which would give us a difference of 115½° between the radiating surface and the air in the room, which, by our original assumption, was to be maintained at 72°. Now, if each of the 80 square feet of radiating surface gives off 2 heat units per hour for each of the 115½° of difference between the surfaces and the air we shall have given out to the room a total 18,480 units of heat.

A unit of heat is the amount of heat which is required to raise the temperature of 1 pound of water 1°, consequently it is the amount of heat which is given back by cooling 1 pound of water 1°. To warm the room in question we have used 18,480 units of heat. We therefore have done the work equivalent to the cooling of 18 480 pounds of water 1°. By our original assumption the water in the radiator was to be cooled 15°. Therefore, to furnish 18,480 units of heat it would require 1232 pounds of water cooled 15° to equal in effect 18,480 pounds of water cooled 1°. We can therefore assume that we have passed through the radiator, under the given conditions, 1232 pounds of water in one hour. As the radiator contained when full 125 pounds of water, we have changed the water in the radiator about 9⅞ times.

The question of the velocity of the current can now be definitely settled, as the problem assumes a very simple form The question now is, with what velocity must the water flow through a 1½-inch pipe to supply 1232 pounds per hour. One linear foot of a 1½ inch pipe contains 0.76 pound of water. Dividing 1232 by 0.76 shows us that the velocity of the water in the pipe to deliver 1232 pounds per hour must have been 1621 feet per hour, or a velocity of 27 feet per minute.

An Average Speed.

This velocity of 27 feet is not an extreme velocity to be met with in a water circulation. It is, perhaps, an average velocity. It will be seen at once how much this velocity may be influenced by existing conditions and how frequently and constantly these conditions are changing in actual practice. The above problem, however, will show a method by which the velocity of circulation under any given conditions can be approximated. We assumed in one place that there were 2 units of heat given out for every foot of radiating surface for every degree difference between the surfaces and the surrounding air. In solving problems in actual practice it would be better to base the calculations on a loss of about 1 75 units of heat per square foot of surface, as that would be found nearer the average, owing to constructional features of the radiator and adverse conditions under which the heat is given off from the ordinary radiating surface, as seen in the average warming apparatus.

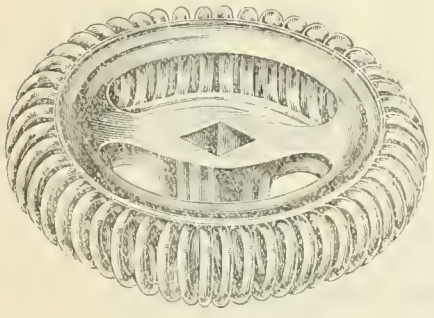
Velocities of the water in the circulation may frequently be found as high as 60 or even 80 feet per minute, and under the proper conditions much greater velocities could doubtless be attained. A further consideration of this question would throw light on the matter of the amount of water which a radiator will properly contain to do the most effective work, and would doubtless abundantly demonstrate, considered in a proper light, that the amount of water contained in any form of radiating surface plays but a small part in deciding

its efficiency; the whole question summed up being merely the choice as to a large body of water cooled a few degrees or a smaller body of water cooled to a greater extent. How important it may be as a practical feature to know what velocity the circulating water should have, from a constructional standpoint, would be difficult to state. At the same time such data would materially aid one in deciding differences of opinion concerning the size of mains and branches.

The velocity of the water in the mains may be computed on precisely the same basis by considering any given number of branches or radiators as a single radiating surface, noting the temperature of the supply and return water and following exactly the same direction as outlined above

Zero Steam Valve Wheel

W. F. Greene of 1931 to 1937 Sixth avenue, Troy, N. Y., has just brought out a novelty in the way of a handle for a steam valve, an illustration of which is presented herewith. The body of the wheel consists of a malleable iron casting provided with a coiled wire edge,



Zero Steam Valve Wheel.

so arranged as to render it always cool to the touch. The various parts are nickel plated and finished with a high polish. The device is strong, light and well adapted to serve the purpose for which it is intended.

HEATING NOTES.

Proposals will be received by the Mayor of Boston up to February 12 for heating and ventilating the primary school on East Third street, South Boston.

J. J. Wilson, heating engineer for the Fuller & Warren Company, Troy, N. Y., recently visited a number of heating plants installed in New England last fall in which their goods were used, and reports general satisfaction. He is about to make a similar visit among the trade in the West.

The Nason Mfg. Company, 71 Beekman street, New York, issue an entertaining little pamphlet in the interests of the Equator steam heater of their manufacture. The pamphlet, bound in black cloth covers, measures 6 x 7 inches in size, and contains 18 pages. The text of the pamphlet is in eight stanzas, telling in metrical form the story of Deacon Crabtree's unsatisfactory experience with a hot air furnace and the excellent results that followed the introduction of an Equator heater. While the verses are of a sort to please the reader, the more casual observer will be entertained by the seven accompanying illustrations of the deacon and his good wife, who at the beginning of the story are trying, ineffectually, to keep warm; then they show their interest in the purchase and setting of an Equator heater, and are finally comfortably settled in a warm parlor, at the back of which, if we read the drawing right, is a Nason radiator.

At 211 Water street, New York, W. M. Mackay, manager of the New York house of Hart & Crouse, Utica, N. Y., has hung out attractive signs calling attention to his house and the Royal line of steam, hot water, hot air and combination heaters. The first floor is fitted up as an office and sample room, where the various apparatus are displayed to good advantage, and a cordial welcome is extended to all visitors. The basement and upper floors furnish storage for several carloads of goods, so that orders can be filled promptly, which is a feature that will be appreciated. David Millar will give special attention to the hot air furnace department, and H. L. Annes will assist Manager Mackay in the steam and hot water department.

Jenkins Brothers, 71 John street, New York, are distributing to the trade their 1894 catalogue and price-list. This is an oblong pamphlet of convenient size, and contains illustrations and descriptions of the various Jenkins specialties, beginning with the Jenkins disk removing lock nut, the Jenkins key stuffing boxes, and then a number of pages are given to the Jenkins valves. A very large variety of these well-known goods are illustrated, and the various sizes and styles are described and the prices given. Later in the pamphlet other specialties are referred to, including their standard packing.

An attractive and somewhat elaborate calendar is issued by the Toronto Radiator Mfg. Company, Toronto, Canada, in the interest of their well known Safford radiators. The calendar, of the poster variety, measures 12 x 17 inches in size, the lower half of each sheet containing the card for the days of the month. The upper part is occupied by a fanciful engraving, reproduced in different colors, showing the Safford radiator for a background and surrounded by representatives of the various nations of the world, including Turks, Chinese, Dutch and Japanese, the place of honor, of course, being occupied by a typical Englishman. A sultana in the lower part of the picture is enjoying the comfortable presence of the radiator, and we presume that the significance of the allegory is that John Bull is making it warm for the Turk.

Albert A. Cryer & Co., heating engineers and contractors, have arranged an attractive showroom at 85 Centre street, New York. A handsome red carpet covers the floor. A space at the front is used for office purposes and a room in the rear for an engineering and drafting department. The attraction in the window is a No. 121 Victor steam heater, finished in red and gold. Samples are shown of a No. 15 and 18 Richmond steam heater and a No. 180 Richmond hot water heater. Next a No. 40 portable Victor heater for steam has the casing and a portion of the dome and tubing cut away so that the internal construction can be seen. Next is a No. 124 Victor hot water heater set in brick with a portion of the wall and staves removed, showing its construction. A No. 44 Victor for steam is set in brick and the interior exposed by a portion being cut away. The next is a No. 44 Victor steam without any covering, showing the bare boiler. On the opposite side of the showroom is a No. 224 Richmond Sectional hot water apparatus, such as is used for heavy duty. The next in order are Nos. 320 and 327 Richmond revertible flue sectional steam boilers. Just inside the door is a No. 44 Victor steam heater with the fire pot, dome and a portion of the tubes cut away, so that the working of the apparatus can be readily explained. A line of the Rex hot water heaters made by the Rex Heating Company, Norwich, Conn., is also displayed, with a line of laundry heaters. The show and drafting rooms are heated by a No. 150 Richmond hot water apparatus, set on the same floor and connected with Bundy Columbian radiators. The workshop and storehouses of the company are at 131 Worth street. A pocket catalogue, bound in Russia leather, gives the line of hot water apparatus handled by the house, with lists of radiator valves, cast iron fittings, pipe coverings and such other goods as are used by heating contractors. The back portion of the book is devoted to information that will be interesting to the trade and several blank pages are left for memorandums.

The Crane Company of Chicago, Ill., have taken the seven-story building, 122-130 Centre street, corner White, New York, occupying a space 84 x 97 feet in size. They are rapidly preparing to carry an extensive and complete line of fittings for steam, water and gas, in cast, malleable and wrought iron and brass goods Their wedge gate valves will be one of the leading specialties, and they will also handle a complete line of pipe cutting and threading machinery made by D. Saunders' Sons, Yonkers, N. Y. The basement will be used for a pipe cutting and threading department, where the trade will be supplied with pipe, according to specification, from 2 up to 16 inches, special machinery being provided for threading fittings of the largest size. Two 75 horse-power boilers and a 75 horse-power Harris-Corliss engine will be used for running the tools and the elevators in the building. The establishment will be under the management of G. Frank Uhler, assisted by Waldron Moore and J. M. Uhler.

The Niagara Radiator Company are building a radiator foundry with a capacity of 1,000,000 feet of radiation per year at North Tonawanda, N. Y., adjoining the blast furnace of the Niagara Iron Company. The company expect to melt iron March 1 and have put into their foundry and their machine shop the latest and most improved labor saving devices and machinery. They will make a full line of direct and indirect radiators for both steam and hot water. The officers of the Niagara Radiator Company are President, G. R. Howard; vice-president and manager, C. F. Walther, and treasurer, F. C. Perew.

T. Kieley, 11 West Thirteenth street, New York, is filling an order for 12 large size Standard steam traps to be exported from this country.

A. S. Matpett is visiting the trade in the vicinity of New York City in the interest of the steam and hot water heating apparatus of the Richmond Stove Company of Norwich, Conn., his New York headquarters being with Albert A Cryer & Co., 85 Centre street.

The J. L. Mott Iron Works, at 133d street, New York, which have been shut down for the past few months, are now reopened and running full time.

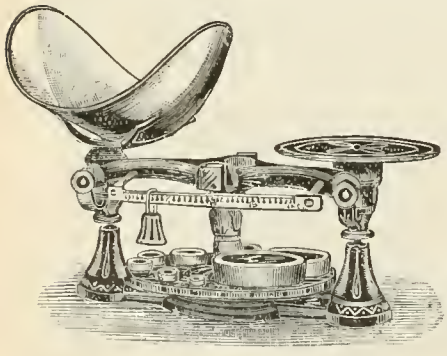
THE RETAIL STORE.

Reading Stove Dealers and Metal Workers' Association.

The third annual banquet of the Reading Stove Dealers and Metal Workers' Association of Reading, Pa., was held on the evening of Wednesday, January 24, in Rajah Temple in the city named. It is regarded by those present as among the most successful ever held by the association, its success being due in large measure to the very excellent work of the committee, consisting of Louis Dauth, William B. Yager and Harry Richards. At 8 o'clock the assembled guests partook of a very tempting dinner, after which toasts and speeches were in order. During the banquet the Amphion Quartet rendered popular selections. Milton H. Schnader presided in the absence of President H. C. Geissler. The first speaker of the evening was Charles S. Prizer, who was followed by William T. Hain, John P. Dauth, Chairman Louis Dauth, to whom much of the success of the banquet was due; W. H. Schick, William H. Bitting and Joseph Yetzer. Among those present may be mentioned the following: Milton H. Schnader, J. K. McKnight, J. S. Wise, representing the Mt. Penn Stove Works; Charles S. Prizer, president of the Reading Stove Works; Wm. T. Hain, Joseph B. Ganter, Jacob M. Prutzman, W. Bridegam, W. Thomas Crosy, Charles Markley, Arnold Dauth, Nehemiah Lewis, Walter M. Prutzman, Joseph Yetzer, Maximus N. Hornan, R. Paff, John P. Dauth, Samuel Geissler, John H. Fett, James Hafer, Adam Kolb, Charles H. Frederick, Gideon Hill, W. B. Yeager, Robert Rankin, Harry Richards, Frank Wagenhorst, U. J. Mast, Geo. Ritter, Lewis Dauth, John Luigard, Wm. H. Schick, Jacob Otto Wm. H. Bitting and William Hill.

I X L Scale.

The Southwark Scale Company, 415 South Second street, Philadelphia, Pa., are putting on the market the scale

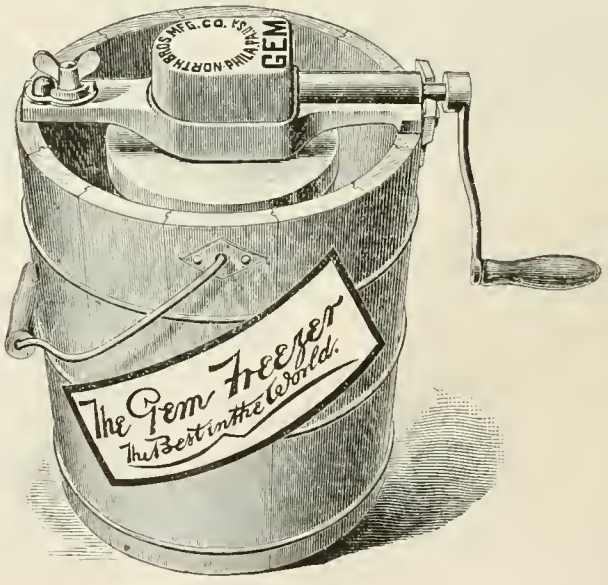


I X L Butcher Scale.

shown in the accompanying illustration. The standard is of iron and the pivots of fine tool steel. The weight holder is of iron and revolves in either direction, thus bringing the weights instantly to hand and obviating the necessity of a weight block. The beam is of brass and the pea weight of iron painted. The weights are supplied in iron or brass, as desired. The scale is handsomely painted and decorated and is made in three styles, counter and butcher scales without beams, and butcher scale with beam, as illustrated. The counter scale is supplied with any kind of scoop required. The scale is made in sizes running from 2 pounds to 16 pounds, and is designed to meet the demand for a cheap and reliable scale.

The Gem Freezer.

North Brothers Mfg. Company, Philadelphia, Pa., for whom John H. Graham & Co., 113 Chambers street, New York, are agents, are offering the Gem freezer improved, as illustrated herewith. The cap covering the gearing is now made separate, and is bolted to the cross piece instead of being cast solid. One advantage of this construction is the small cost at which the parts can be replaced if for any reason they should be broken. Another feature is

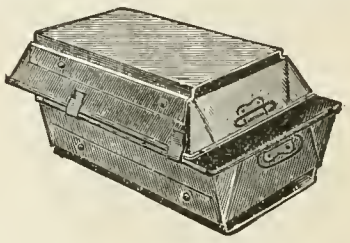


The Gem Freezer.

the arrangement of the gearing, which, it is stated, obviates all danger of its binding. All inside parts of the freezer are thoroughly coated with pure block tin, and the outside parts are galvanized. The pails are made of Virginia white cedar, upon which are used galvanized electric welded wire hoops. The hoops are embedded in grooves made in the pail, securely clamping the staves, making it impossible, the manufacturers state, for the hoops to fall off or to be forcibly removed without injury to the hoops or pail. It is claimed that expansion of the wood cannot break the wire hoops, that they will not stretch, that being round only a small portion of the surface is presented to the pail, and that the hoop conduces to a better and stronger joint than is possible by any other method. The Gem freezer is made in 1, 2, 3, 4, 6, 8, 10 and 14 quart sizes.

The Ressler Roaster and Baker.

Will & Weber, 420–422 St. Clair street, Toledo, Ohio, are putting on the market a roasting and baking pan,



The Ressler Roaster and Baker.

as shown in the cut herewith. The pan comprises two like sections, with flaring sides, held together with a novel form of hinge connection, which also allows the upper pan to be slid upon the lower pan, as shown in the cut, when it is desired to brown the article of food being cooked. There is also a double or extra bottom on each pan, which can be removed by sliding, which is designed to modify the heat of the oven in its effect upon the article within the pan, to give a uniformity of temperature during the process of baking or roasting, and to avoid all danger of burning or drying. It is pointed out that as the pans are exact duplicates the wear of the two pans is insured, as they may be reversed in position or may be used singly for other purposes; also that the detachable hinge makes it easy to secure the pans in position or to detach them.

A CIRCULAR is issued by the Pittsburgh Brass Company, Allegheny, Pa., directing attention to the Pittsburgh mammoth lamp. A general view is shown of this lamp, while smaller cuts show the spring extension and also the indicator with which the Pittsburgh

mammoth fonts are furnished. The indicator tells at a glance the quantity of oil in the font at all times.

The Improved Henry Combination Haft.

Horace E. Britton, Stoughton, Mass., is offering an improved haft with 12 tools, as shown in the accompanying

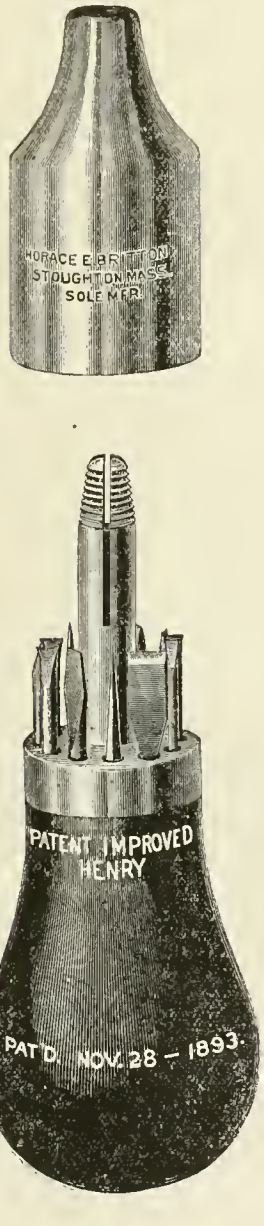


Fig. 1.—The Improved Henry Combination Haft.

cut. The improvement consists of a tempered steel pin or stud, secured between the quarters of the chuck at the bottom of the slits, and extending up between the quarters the necessary length to form a solid and sure support for the shank of the tools when in use, as shown in No. 3, Fig. 2. Fig. 2, No. 1, represents the chuck of the old style Henry combination hafts with the shoulders exposed to view, which are meant for a rest or support for the shank of the tools, and has proved to be its weak point; while No. 2 shows the old style chuck with the shoulders broken down by the shank of a tool having been driven away up between the quarters of the chuck, causing a lasting injury that renders the haft almost worthless. The new chuck, it is stated, obviates all chance of such accidents. The tools, Fig. 3, include five brad awls, one chisel, screw driver, diamond pointed awl, marking awl, countersink, tack puller and reamer. The advantages claimed for the haft are as follows: It carries the tools in the same end of the holder in which

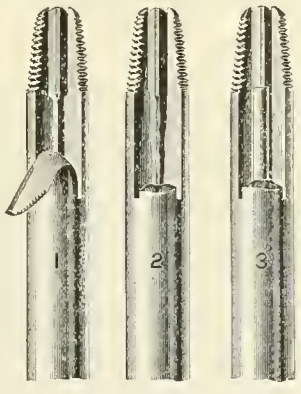

Fig. 2.—Construction of Chucks.

they are used; it necessitates no shifting of the holder end for end in changing tools; the tools do not need to be shaken out into the hand to select the one wanted; the same motion that loosens the tool in use removes the cap that covers the surplus tools; no wrench is used, and the haft can safely be used with a mallet or hammer without material injury.

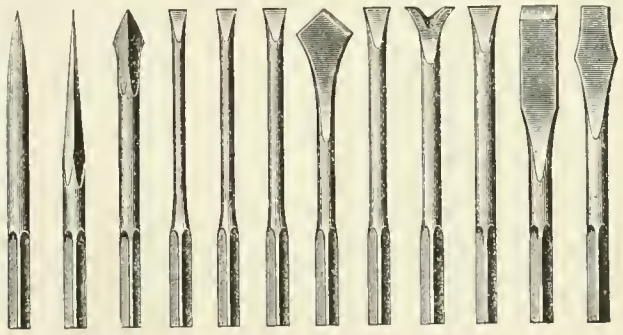

Fig. 3.—Tools Furnished with Haft.

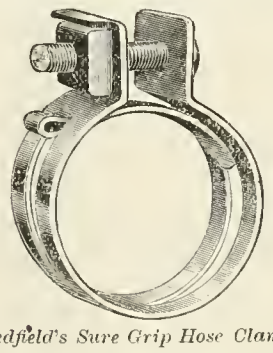
Redfield's Sure Grip Hose Clamp.

The accompanying illustration shows a device put on the market by J R. Clancy, Syracuse, N. Y., known as Redfield's Sure Grip hose clamp. The clamp is made of wrought steel and many special advantages are claimed for it besides being low in price. A feature to which particular attention is directed is that



Redfield's Sure Grip Hose Clamp.

the construction offers a true inner circle before and after tightening. It will be seen from an inspection of the engraving how this is accomplished. The clamp at present is being made in sizes of 1 inch for two and three ply garden hose, ¾ inch for three ply, ¾ inch for four ply and 1 inch for three ply; also 1¼-inch air brake or steam hose.

MEMORANDA.

The Hurd Refrigerator Company, Duluth, Minn., issue a catalogue devoted to their refrigerators. Illustrations are given of the Hurd system of circulation as employed in their refrigerators, their patent glass trap, and of soft wood and hard wood refrigerators, sideboard refrigerators, grocers' ice chests, fish boxes, sideboard water coolers, &c. The manufacturers state that their designs for this year are new and are in keeping with the latest and best style of furniture, and that their goods are filled as follows: Next to the outer wall, and also next to the inner wall, are placed layers of odorless paper; the space between these layers of paper is filled with mineral wool, as the best non-conducting substance. Attached to the frontispage of the catalogue is the blue ribbon awarded the Hurd Refrigerator Company for their exhibit at the Columbian Fair.

The Griswold Mfg. Company, Erie, Pa., are offering the trade a novelty in tea kettles of more than usual interest. It is a new aluminum tea kettle, made of the pure metal and in a single piece. The manufacturers point out that there is no spout to melt off or seam to open and no chance for leakage. Furthermore the surface does not tarnish or corrode. It has a smooth surface like silver and it is easily kept bright, besides being stiff and firm. Aluminum is an excellent heat conductor and very well adapted for this and similar purposes. Of course the extreme lightness of the metal is another advantageous feature.

We are indebted to William T. Hain of 327 Penn street, Reading, Pa., for a four-page folder illustrating and describing the new Keystone roasting and baking pan for poultry, meats, fish, bread, cakes, &c. The circular gives directions for using the pan for its various purposes and also presents a price-list.

The Rochester Lamp Company, 42 Park place, New York City, distribute circulars illustrating the Rochester portable parlor heater of their manufacture. On the backs of the sheets a description is given of the device and its advantages are referred to.

The Little Giant Truck Company's works, at Syracuse, N.Y., have been secured by the G. L. Van Namee Mfg. Company, also of Syracuse, who will continue to manufacture the Little Giant steel trucks and other hardware specialties. The Syracuse Door Hanger Company are the general sales agents for the trucks.

The snowfalls of the past week were productive of good in affording work for a large number of the unemployed in Eastern cities and towns.

STOVE TRADE NOTES.

Cupola Management.*—II.

BY DR. EDWARD KIRK.

Sand Bottom.

When the door or doors are in place and properly supported any openings or holes that may have been burned through them are carefully covered with a thin plate of iron, and all cracks through which the bottom sand might escape when dry are closed with clay. The doors are then covered with a bed of sand several inches in thickness, which is known as the sand bottom. The sand employed for this purpose must not be of a quality that will burn away and permit the molten iron to get down to the doors or melt and form a hard mass that will not fall from the cupola when the doors are dropped, neither must it be so friable as to permit the molten iron to run through it when dry.

The clay sands when used for a bottom burn into a hard, tough mass that adheres to the lining all around the cupola, and the small cupola frequently remains in place after the door is dropped and has to be dug out with a bar before the cupola can be dumped. Parting sand, sharp and fire sands are very friable and difficult to keep in place. They do not resist the action of the molten iron well, but melt and form a slag. Mixtures of clay and sharp sand burn too hard and do not drop well. The loam sands are the only ones suitable for a sand bottom, and sand that has been burned to a limited extent makes a better bottom than new sand.

In stove and other foundries with large gangway floors the scrapings from the gangways are collected in front of the cupola, passed through a No. 2 riddle to recover the scrap iron and the sand used for the cupola bottom. This sand makes the very best kind of a bottom. It is clean and free from cinder, soft and pliable, packs close, resists the action of the molton iron and drops free. In foundries where the daily gangway cleanings are not sufficient to make the bottom, part of the old bottom is used over and the gangway cleanings are mixed with it or placed on top. In foundries where there are no regular gangways to clean every day the heavy part of the dump is thrown out and the sand bottom passed through a No. 2 riddle and used over again. When the bottom sand is used over day after day it must not be riddled out too close and a little fresh material must be added to it each day to prevent it becoming rotten from repeated burnings and containing too many small particles of cinder, which render it fusible and easily cut away by the molten iron. The cleanings from the molding floors are generally added or a few shovels from the sand heaps, and in case it becomes too rotten a few shovels of new molding sand are mixed with it.

When the material contains so much cinder that it does not make a smooth bottom, a few shovels of burned sand from the heaps are put on top to give an even surface and prevent the molten iron coming in contact with the cinder and cutting the bottom. The bottom sand is generally wet with water, but some melters wet it with clay wash, to make it more adhesive and give it more strength to resist the action of the molten iron. A thick clay wash gives strength to a rotten sand when mixed with it, but it also increases the tendency of the bottom to cake and hang up, and it is better to improve the bottom material in the way above described and wet it with water only. The sand when wet is cut over and evenly tempered, and should be no wetter than molding sand when tempered for a mold.

The sand may be thrown into the cupola through the front opening, or may be thrown in at the charging door. but it is generally thrown in at the front, for it is more convenient to the material, and is also convenient for spreading it in the cupola. When the cupola is small the melter stands by the side of it and makes up the bottom by passing his arm in through the front opening, but when the cupola is large he goes inside, and his helper shovels the sand in as he wants it. The first sand thrown in is carefully packed around the edges with the hands to insure a tight joint. As the balance of the sand is thrown in it is spread evenly over the bottom in layers from 1 to 2 inches thick, and each layer is evenly rammed or trampled down until the required thickness of bottom is obtained, which is from 3 to 6 inches, according to the rise of the cupola. The desired pitch or slope for throwing the iron to the front is then given, and the bottom butted evenly and smoothly all over. The melter next goes carefully around the edges with his hands and feels for any soft spots there may be near the lining, and slightly raises the edges of the bottom around the lining to throw the iron off and prevent it working its way down between the lining and sand bottom. The bottom is then carefully brushed and smoothed off, and in small cupolas a bucket of thin clay wash is sometimes thrown in at the front and caught in the bucket as it runs out. This is called slushing the bottom, and is done to give a smooth, hard surface.

The sand bottom does not always remain impervious to the molten metal, but is sometimes penetrated or cut up and destroyed by it. in which case a leakage of molten iron takes place from the bottom of the cupola that is difficult to stop. Leakage of this kind may be due to springing of the bottom doors when charging and the cracking or loosening of the sand bottom around the lining. This can be prevented by placing more props under the doors to support them. Sand that has been used over and over in a bottom until it has become worn out and filled with cinder is readily cut up and converted into a slag by the molten iron, and it is only a question of the time occupied in running off the heat whether the bottom gives way or stands. When the bottom sand gets into this condition, it must be renewed by the addition of new sand, or the bottom covered with a layer of sand from the molders' sand heaps.

Molten iron will not lay upon a wet, hard substance, but will explode or boil and cut up the material upon which it is placed. If the bottom sand is made too wet, or rammed too hard, or rammed unevenly, the iron will not lay upon it, but will boil and cut up the sand until it gets down to the doors, which it will melt and run through. When a bottom cuts through melters frequently attribute it to the bottom being too soft ; and I have seen them take a heavy pounder and ram a bottom as hard as a stone. In these cases, if the sand was worked very dry, or the bottom was well dried out before any molten iron came in contact with it, it did not cut up or leak ; but if the sand was wet when the molten iron came down, boiling at once took place and the bottom soon cut through —and in such cases they generally cut through about every other day. In the sand bottom of a cupola we have the same elements to contend with, so far as molten iron is concerned, as we have in a mold ; and the sand should be worked no wetter, rammed no harder, and rammed as evenly as the sand for a mold. The sand should not be worked wet for a bottom, under the impression that it is dried out before the iron comes down, for the ashes of the shavings, wood, coal or coke cover the bottom soon after the fire is started, and protect it from the heat to such an extent that it is only dried to a very limited extent before the iron comes down upon it. Water may be seen dripping from a very wet bottom long after the blast is on. Even if it were dried out wet sand cracks when dried rapidly and should not be used. I shall not attempt to give any directions for stopping a leak after it occurs, for the time and place to stop a leak is when putting in the sand bottom ; and if all the remedies I have given for preventing leaks fail, then it is time to change the melter.

The pitch or slope given to the bottom to cause the molten iron to flow to the tap hole from all parts of the bottom has a great deal to do with the temperature of the iron and nice working of a cupola. When the bottom is made too low and flat molten iron lies in the bottom of the cupola and becomes dull. As the melted iron falls into this iron drop by drop it is instantly chilled and the iron when drawn from the cupola is dull. This effect is more marked in a cupola melting very slowly, and a low bottom may be the cause of very dull iron when a sufficient quantity of fuel is consumed to make very hot iron. A high pitch throws the iron from the tap hole with great force and spouting velocity, and it is almost impossible to run a continuous stream from a cupola with such a bottom. It is more difficult to keep the tap hole and spout in order, and the stream must be closely watched to prevent it shooting over the ladle and burning the men. Slag flows freely from the tap hole with the stream of iron when the bottom has a high pitch, even when there is very little slag in the cupola. But the flow of slag from the tap hole with the iron may be entirely

* Copyrighted, 1894, by Edward Kirk.

stopped by changing the pitch of the bottom, no matter how great the quantity of slag in the cupola. The action of the iron at the spout is entirely changed by the pitch of the bottom. A hard iron may be made to run smooth from the spout while a soft iron may be made to sparkle and fly, giving all the indications of a hard iron. The best expert on the quality of iron at the spout may be deceived in the iron by the pitch of the bottom, and it is only in the extremely hard and extremely soft iron they cannot be deceived. The bottom should never be made hollow in the center and high all around the outside with an outlet or trough to the spout. This concentrates the iron in the center in such a way that a few hundredweight places as great a pressure upon the front as a ton would do if the bottom were flat, and the front may therefore be forced out by a comparatively small body of iron. The instant the tap hole is open the iron rushes out with great force, and it is almost impossible to stop it as long as there is any molten iron in the cupola

The bottom should be made flat and level from side to side with only a slight rise around the lining, which should not extend out more than 1 or 2 inches from the lining. The pitch from back to front should not be more than ½ to ¾ inch to the foot. This has been found to be a sufficient slope to throw all the iron to the front in an ordinary cupola. But in cupolas that melt very slowly a little more slope may be given, so as to concentrate the iron more rapidly and prevent it chilling on the bottom.

In cupolas with two tap holes the bottom must be sloped so that all the melted iron in the cupola can be drawn from either tap hole. It is very difficult for a melter to see what slope he is giving a bottom when inside the cupola, and for this reason many of them seldom get the slope alike. The melter should be provided with a notched stick or some other gauge, for measuring down from the top or bottom of each tuyere, to serve as a guide in sloping the bottom, so it may be given the proper pitch and put in alike every heat.

New Enterprise Gas Range.

In appearance this new gas range, just brought out by Luther & Lederhos, 30 Cliff street, New York, so closely resembles an ordinary coal range that at a glance it might readily be taken for one. It has a cast iron body and is attractively ornamented. The range stands 26 inches high and has a top 31 x 26 inches with a pipe collar at one end and four 8-inch cooking holes. The oven is of sheet iron and is arranged with two side diving flues and one central return flue, all extending under the oven so as to heat it evenly. At the fire chamber end efficiency and economy have been grouped. Two pyramid coil burners, three tiers high, are placed here that have a capacity of 25 feet each, or either may be used and the consumption greatly reduced by reducing the supply. When in full operation baking is very promptly done, and a gallon of water is said to boil in 18 minutes in a vessel set over the burner. At the same time a broiler on the end opposite broils a chop quickly, and a water coil surrounding the burners is provided for heating water in the kitchen boiler, and which has on test heated 30 gallons in two hours. With this capacity but two valves are necessary to control the operation, and a large space is afforded by the top for articles that are cooking; the demand for such a space having been found in the gas stove market. A circular is issued by the firm with illustrations showing the range both with and without the broiler and water coil, and announcing that the first ranges will be ready for shipment after February 15.

ODD PLATES.

Sam S. Utter of 113 Beekman street, New York, has been doing a good business in oil and gas stoves, and he expects that his sales during 1894 will fully double those of last year. His establishment of agencies in the principal cities of the United States and Canada is referred to as having been the means of largely increasing his business.

We understand that the Kernan Furnace Company, Utica, N. Y., have recently increased their capital stock from $50,000 to $100,000. The notice of increase which appeared in these columns not long since had reference to an augmentation in capital which occurred last year.

The Bellaire Stove Company, Bellaire, Ohio, are making use of a sticker in the general shape of a legal seal, about 2 inches in diameter, which bears a very orignal sort of legend. The red paster is nicked at the edge in the orthodox fashion and on it in white letters are the words: "Solomon had 1000 wives. The Bellaire Stove Company have millions of them using their stoves and ranges."

John H. Welteroth, Williamsport, Pa., reports 1893 as a prosperous year, and has remodeled and enlarged his establishment to better display his line of stoves, plumbing and heating goods and meet the demands of his growing business, a feature of which is tin and sheet metal work. To facilitate his personal work he has fitted up a handsome private office and established a stenographer in it. He makes a specialty of the Howard hot air furnaces and the stoves of the Raymond & Campbell Mfg. Company.

The R. E. Dietz Company, 76 Fulton street, New York, are issuing a new edition of their cook book which, in addition to the receipts, shows the Dietz tubular heating and cooking stoves. The new steel fount lamp oil stove made with one and two burners with extension tops and ovens appears in the book for the first time. Another new stove is the Dietz new double cylinder gas heater. It has a star burner set over a gauze plate with a reflector beneath it. The heat of the stove is carried up the center of the stove to the top by means of an inner cylinder, which is perforated near the top, letting the heat escape to the outer cylinder of Russia iron. The outer cylinder is ornamentally perforated at the bottom and a few inches above, creating a continual current of air through the stove and keeping the air in the room in circulation, while a strong radiant heat is thrown off by the stove.

Isaac Brooke, one of the stove manufacturing firm of Floyd, Wells & Co., Royersford, Pa., recently sustained serious injury by falling down an elevator shaft at the works.

David Millar, formerly with the Boynton Furnace Company, is now the furnace expert of W. M. Mackay, manager of the New York house of Hart & Crouse of Utica, N. Y. The merits of the Royal hot air furnaces will be presented to the dealer and invitation extended to examine the line of samples at 211 Water street, New York.

H. Gilbert Hart of Hart & Crouse, Utica, N. Y, manufacturers of the Royal line of heating apparatus, has been visiting the heating trade in the West, and met W. M Mackay of the New York house at Chicago, visiting that trade together.

The J. D. Smith Foundry Supply Company, Cincinnati, Ohio, are making use of a novel style of letter head. It has the appearance of a small pamphlet entitled "The Radiant," issued at Cincinnati every month, the specimen number before us being Vol. I, No. 4. The first page is blank, excepting the heading, intended for ordinary letter purposes; the second page contains a collection of witty sayings and other interesting matter, while the third and fourth pages direct attention to several of the specialties of the J. D. Smith Foundry Supply Company.

The resumption of all the departments of the foundry plant of the Littlefield Stove Company, New York, was delayed by the illness of the foreman, John G. Watkins, but all departments are now running. The works have given employment to 125 men and these include molders, finishers and nickel platers. The plant will be run on full time as long as trade conditions permit. Treasurer Henry C. Littlefield of the company says that he can see no bright prospects as long as the tariff question remains in an unsettled condition. The company were compelled to begin work as the stock on hand had become depleted. No reduction in wages has been made nor do the company intend to make any unless forced to by unforeseen circumstances.

The Huette-Barler Mfg. Company of Chicago have changed the name of the corporation to the A. C. Barler Mfg. Company. The company manufacture the well known Barler's Ideal oil heater at 111 and 113 Lake street.

The Minneapolis *Commercial Bulletin* observes that the stove trade in that section is quiet, the short trade of the fall and early winter not having created a supplemental winter trade. The fall demand developed the fact that in many instances—enough in total to materially affect the trade—kitchen ranges were made to do duty for heater and range combined, thus saving on the first cost of stoves and fuel.

Reports from Indianapolis, Ind., are to the effect that the Indianapolis Stove Company of that place are running full time and giving employment to 90 hands.

The Enterprise Stove Company, with works located at Vincennes, Ind., have resumed operations with a large force.

The Chicago & Erie Stove Company of Erie, Pa., have issued a four-page folder, printed in colors, giving selections from numerous letters received from their customers relative to the successful operation of the Superb Helper steel ranges in different parts of the country with various kinds of fuel. The letters are very complimentary, and the manufacturers cannot feel otherwise than gratified at the success with which their goods are meeting.

The Peninsular Stove Company of Detroit, Mich., have issued from the press some attractive little folders, relative to their Rival Peninsular and

Welcome wood cook stoves, which have become popular among the dealers. The Rival Peninsular is made in seven sizes, with ovens, ranging from 18 x 12 x 12 inches up to 24 x 27 x 14 inches It is referred to by the manufacturers as a perfect baker, attractive in design and low in price. The Welcome four-hole wood cook is made in five sizes, and has among other features large flues, heavy covers, patent oven door opener and nickel trimmings.

In referring to the organization of the Board of Directors of the Buckwalter Stove Company of Royersford, Pa., last week, a slight error occurred with regard to the office of Mr. Staufer. It should have been given as superintendent instead of secretary and superintendent. The corrected list of officers, therefore, reads as follows: J. A. Buckwalter, president; I. N Buckwalter, vice president; R. E. Springer, secretary; T. D. Buckwalter, treasurer, and William M. Staufer, superintendent.

A somewhat massive souvenir comes to us from the Troy Nickel Works, Troy, N.Y., makers of the famous Alaska stove trimmings. It is an herculean key, nearly 8 inches in length, and is decorated with the legend, "Troy Nikell Wurx Offis Kee." Before reading the inscription we thought very likely it was a replica of the key to their success, which naturally would be of more than usual dimensions. However, we have no wish to put any false interpretation upon it, for we choose rather to regard the gift of an office key as another expression of that charming custom known as leaving the latch string on the outside of the door. We are grateful for the implied hospitality.

The Quick Meal Stove Company, St. Louis, Mo., are sending out to their customers a rubber stamp for use on their letter heads, bills, envelopes, &c. The stamp has the dealer's name and address, and also the following, "Quick Meal Gasoline Stoves," with their well-known trade-mark in the center. The idea is a good one, and will doubtless benefit the dealer as well as the Quick Meal Stove Company.

The stove works of Orr, Painter & Co., at Reading, Pa., resumed on January 31, full handed, giving over 400 men employment.

It is reported that the Fair & Day Foundry Company will add a stove works to their plant at Knoxville, Tenn.

The Bridgeport Stove Works Company is the new name of the works that have been operated by Lowman Brothers, at Bridgeport, Ala.

George H. Barnour of the Michigan Stove Company, who has been so active in the work of caring for the unemployed at Detroit, undertook the management of a grand charity concert at Detroit, Thursday evening, February 1.

The Quincy Steel Range Company, Quincy, Ill., issue an illustrated catalogue and price-list of steel ranges of their manufacture. The first ranges noticed are the Steel Jewels, made for hard or soft coal, wood or coke, in various sizes and styles. Five different illustrations show the various styles. In describing the Steel Jewel, they say that the oven, body and flues are of cold rolled sheet steel of No. 14 gauge. The tops, doors, panels, grate and liners are of the best Bessemer pig iron. High closets and shelves are of Wood's planished iron, the flues are lined with asbestos, the doors and panels are nickel plated and shaking and dumping grates for wood or coal are provided. The Noxall ranges are likewise made for hard or soft coal, wood or coke, Illustrations show their general appearance and brief descriptive particulars are given.

Bramhall, Deane & Co, 79 to 83 Market street, Chicago, have been succeeded by Deane, Huot, Brooks & Moncuse Company, who will continue to manufacture Bramhall, Deane & Co.'s and Duparquet, Huot & Moneuse Company's wrought iron ranges and broilers Their line also comprises carving tables, coffee and tea urns, copper and iron jacket kettles, steam roasting ovens, copper, tin and iron cooking utensils, bake ovens, &c., for use in hotels, institutions, restaurants and steamboats.

The Palermo Mica Company, 27 Peck slip, New York, issue in an attractive form their 1894 price-list of selected mica. It is a folder, black on the outside and orange color within, with a satin loop in the corner. In sending it to the stove manufacturers and jobbers the company announce that they have greatly improved facilities at their mines for carefully handling mica, and as their business is exclusively in mica, they are able to give it undivided attention. They call attention to their assortment of assorted packages, put up particularly for the retail trade. The particulars of these assortments are printed in silver ink on the back of the circular. Accompanying the list is a card announcing S. T. Peckham as sales manager of the Palermo Mica Company.

We are indebted to the Twin Burner Vapor Stove Company, St. Louis, Mo., for their 1894 price-list and catalogue. In presenting this volume to the trade they announce that they have attained the object which has been sought by gasoline stove manufacturers for years—namely, a vapor stove upon the evaporating principle that will fill all requirements for cooking purposes and one that is simple and easily managed and understood. This stove is the Twin Burner Process, which has no internal mechanism, no drip cups or parts to rust out, and the stove is open to inspection. They are claimed to work perfectly in cold weather, the needle points of the valves being German silver, not corroding and always insuring a steady drip. They are also supplied with sight glasses to each valve, through which the dripping of the gasoline in feeding the burner can always be seen. They call attention in particular to the fact that the coming season all their Twin Burner junior stoves will be made with lay down tank, and no extra charge will be made for the convenience. The pamphlet shows a large number of their Twin Burner stoves of various sizes and capacities. Some 16 pages are given to illustrations and price-lists of the goods. At the close are some instructions for the care of stoves and notice of miscellaneous gasoline goods.

A neat little pamphlet is issued by W. W. Lawrence & Co., Pittsburgh, Pa., entitled "Points on Putty." It is justly observed on the front cover that "the points in this primer will not make you rich, but may save you from annoyance and trouble." A great deal of serviceable information is contained in this little book of a dozen pages. Incidentally, of course, attention is directed to the goods of Messrs. Lawrence & Co.

Trade Notes.

We are indebted to A. Mugford, Hartford, Conn., for a pamphlet of sample engravings that he has made. The work done by him is of a high character, as shown in the specimen illustrations, which include cuts of machinery, Heating Boilers. Lathes, Bicycles, Radiators, Stoves, &c. Among the specimens presented in the volume are the goods of several firms with whom our readers are familiar, such as the Buffalo Forge Company, the Raymond & Campbell Mfg. Company, Jarecki Mfg. Company, Curtis & Curtis and the Richmond Stove Company.

We understand that D. R. Brownlow, Middletown, Conn., has invented a Curling Iron Heater, which he describes as a new device for heating a Curling Iron over a lamp chimney or gas jet without smoke or collecting lamp black. We are informed that capital has been raised for the manufacture of the article.

In our issue of January 20 we stated, by mistake, that Harvey L. Blank was to start in business for himself. The facts of the case are that H L. Blank, the junior member of Blank & Son, Pottsville, Pa., is connected with the Minersville Brass Works of Minersville, Pa., in the capacity of manager. This plant, however, is not yet in operation, and the machinery is only now being put in place. The company will manufacture supplies for steam and hot water fitters, plumbers and building hardware.

The building at 63 and 65 South Canal street, Chicago, partially occupied by the Chicago Clothes Dryer Company, was destroyed by fire on the 29th ult. The company's loss is stated at about $15,000. They manufacture a patented heating apparatus for drying clothes as rapidly as they are laundried.

The Lockport, N. Y., Indurated Fiber Company expect soon to increase their force of employees by 100 additional men. This is due to the closing of the branch works of the company at Portland, Maine.

The Star Baker Company, Belleville, Ohio, have completed a new building 30 x 40 feet in size, two stories high, especially adapted to the requirements of manufacturing Roasters and Bakers. The entire building will be used for the manufacture of the Columbia Roaster and Baker exclusively. We are advised that their increased facilities will enable them to make especially low prices on the goods.

The Portland Tinware Company, Portland, Maine, held their first annual meeting on January 16, at which L. W. Bradstreet was elected president and J. W. Davis treasurer. The company report that the year's business was a satisfactory one. They employ from 15 to 20 hands.

On another page of this issue J. W. Bell & Co., Mercer, Pa., are directing attention to the Wire Eave Trough Hanger which has been on the market for some eight years. The manufacturers inform us that the sales have been increasing steadily since it was first offered to the trade, and that it is now handled by over 60 of the leading jobbers throughout the country. The business for 1894 has thus far been satisfactory and the prospects for the coming year are hopefully regarded. The hanger is made in nine sizes and troughs of almost any make from 3½ to 7 inches in width can be fitted.

TRADE REPORT.

The Iron Market.

During the past week the improvement in certain branches of the Iron trade has gained further headway and a far more cheerful tone prevails. Buyers have taken hold, and it looks as though some of them have already missed their best opportunity.

The past week has been very active in Western Steel markets. The low prices made on Steel Billets—$15, Pittsburgh, having been undoubtedly done in a few cases—and the heavy demand in the Wire trade have led to heavy purchases of Billets and a large volume of inquiries.

In Foundry and Forge Irons there is a better feeling so far of volume of business is concerned, but prices are still very weak and it will take quite large sales before an improvement sets in.

In the Wire trade a stiffening in prices has taken place, as the result of large orders, induced obviously by the very low prices. Wire Nails have sold at Western factories, in large blocks, at the extraordinary price of 90¢ a keg. Now $1.05 is being asked by some makers. It is stated that two mills alone have orders for close on to 500,000 kegs on their books. Greater activity is also spreading in the Barb Wire trade.

An interesting item is the capture by the American Tube & Iron Company of an order for 60 miles of Wrought Iron Line Pipe for the Ontario Natural Gas Company. It may be remarked in this connection that the Canadian Iron markets are worthy of close study by our mills. The Dominion trade generally stocks up in the fall until the next spring, so that little could be done until now. But the time is now approaching when a vigorous campaign in Canada might lead to some good contracts.

Pig Iron.—Inquiries in the New York market are somewhat better, and the volume of business has increased, although it has needed the aid of concessions in some grades to stimulate orders. Efforts to contract beyond July for standard brands are cropping up, but are not meeting with any encouragement. Little has been done in the Cast Iron Pipe market, the Quincy, Mass., order going to the Radford foundry at $22.56, delivered. We quote standard brands $13 @ $13.75 for No. 1; $12.50 @ $13 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $13.50 for No. 1; $11.75 @ $13 for No. 2; $11.50 @ $12 for No. 3; $11.25 @ $12 for No. 2 Soft, and $12 @ $12.50 for No. 1 Soft

A fairly active demand for Pig Iron is reported from the Philadelphia district, and in some cases lots of considerable size have been taken, but on the average it has probably been at some slight sacrifice in prices. There is a conviction, however, that low prices have come to stay, so that when a desirable order is on the market there is a disposition to take it without regard to a few cents per ton from ruling quotations. General quotations are about as given herewith; but it would be a little misleading to suppose that any large amount of business is done at the outside figure. As a matter of fact, the heaviest end of the business is at the inside figure, or very close to it, and in special cases even the inside figure can be shaded a few cents per ton. For Philadelphia and equivalent deliveries quotations range about as follows:

No. 1 Foundry	$13 00 @ $14.00
No. 2 Foundry	12.50 @ 13.25

Advices from Chicago report that business in local Coke has been a little better. More orders were taken than during the previous week, and inquiries continue to come in from new directions. Consumers, however, are not at present inclined to anticipate their requirements more than for a month ahead, so that orders are largely for immediate shipment. Prices have been slightly reduced, as will be seen by the quotations below. Southern Coke Iron is also moving in small lots only and prices are a little weaker, also leading to revised quotations. Quotations are given as follows, for cash :

Lake Superior Charcoal	$15.30 @ $15.50
Local Coke Foundry, No. 1	12.50 @ 13.00
Local Coke Foundry, No. 2	12.00 @ 12.50
Local Coke Foundry, No. 3	11.75 @ 12.00
Local Scotch	13.00 @ 13 50
Ohio Strong Softeners No. 1	15.00 @ 15.50
Southern Silvery, No. 1	@ 13.75
Southern Silvery, No. 2	@ 13.25
Southern Coke, No. 2	11.50 @ 11.65
Southern Coke, No. 3	11.00 @ 11.50
Southern, No. 1, Soft	11.50 @ 11.65
Southern, No. 2, Soft	11.00 @ 11.50
Tennessee Charcoal, No. 1	16.00 @ 16.50
Tennessee Charcoal, No. 2	@ 15.00
Alabama Car Wheel	18.00 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

The past week showed no improvement in the Pittsburgh Pig Iron trade, except that inquiries for Foundry were perhaps a little more plentiful. No. 2 Foundry Iron is looking up a little in demand, very little No. 1 being sold in this market. Quotations are as follows :

No. 1 Foundry	$11.75 @ $12.00, cash.
No. 2 Foundry	10.75 @ 11.00 "

There has been no increase in the volume of business in Pig Iron in Southern markets during the week, and no improvement in prices. There is, however, more urgency to sell Foundry grades and buyers could obtain concessions of at least 25¢ ℔ ton for both spot and forward delivery if they would make the bids. No. 2 Foundry is offered at $7.55, and No. 3 Foundry $7.25, f.o.b. Birmingham, deliveries to begin now and to continue during the next eight months, or the delivery would be made to meet the convenience of the buyer within that time. The fact is the market is in such a demoralized condition that in the absence of buyers it is difficult to say how low they might secure Iron. There is no demand for any considerable lots of Charcoal Iron, but there are small sales at previous prices. Quotations are merely nominal, as follows:

Southern Coke, No. 1	$11.75 @ $12.00
Southern Coke, No. 2	10.50 @ 10.75
Southern Coke, No. 3	10.00 @ 10.25
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin—Although a revision of the rules went into effect at the opening of the year under which contract deliveries on the Metal Exchange were made to involve as small lots as 5 tons, thereby offering more inducement for consumers to purchase economically for future delivery, as well as offering greater inducement for outside speculation, the market remains in a flat condition. During the past week there has been more or less fluctuation in prices, with 20¢ the highest and 19.85¢ the lowest point. The highest price named is below the cost of importation of Tin, duty paid, but neither that nor the fact that ordinary trade requirements have made more of less impression upon spot stocks has stimulated business in the slightest degree. Consumers and dealers have purchased only as imperative wants dictated, while prices have averaged somewhat lower for prompt and near future deliveries. Spot and February delivery has been openly offered at 19 90¢ during the past few days, and *sub rosa* at a shade less, net cash terms. March delivery was publicly offered at 19.85¢. Subsequently 5 tons were sold at 19 75¢. Smaller quantities than 5 tons have been selling at proportionately low prices, Straits

Pig being quoted nominally at 21½¢, which is now quite the outside asking price for moderate quantities from stock. On the whole, the market has shown poor form during the week.

Copper.—No improvement is noticeable in purchases of Lake Superior Ingot, and the demand, to all accounts, is still on a very moderate scale. Leading producers do not appear as urgent sellers, but offerings of moderate quantities from one source and another have had sufficient weight to keep prices rather weak. At the present time 10¢ is doubtless an extreme high rate. In fact, moderate quantities of the metal are available at a shade less, ordinary terms of sale, while speculators offer at as low as 9¾¢ for March and later deliveries. For small lots of Lake Superior Ingot jobbers ask 11¢, but this price is liable to shading under favorable circumstances. Electrolytic is unsettled, with prices at low range. Casting stock has been in somewhat better demand, and these brands are the steadiest of all in regard to price, sellers at less than 9.35¢ being now very few, while 9.40¢ @ 9.50¢ is generally asked for best brands in round lots, with an advance of ¼¢ @ ¾¢ on small jobbing quantities. The demand for manufactured Copper, although slightly better, still remains considerably below normal for this season.

Pig Lead.—There has been an advance of about 0.7½¢ on actual sales, 3.25¢ having been paid for carload and larger lots. That price was subsequently bid for additional parcels and refused. Holders are now generally asking 3.30¢ for prompt and forward shipments. The stronger tone is due chiefly to livelier business at Western points, including 25 carloads or more very recently at about 3.05¢ in East St. Louis. Eastern consumers are still very cautious buyers and neither jobbers nor speculators have manifested active interest in forward deliveries despite the movement in the Western market.

Lead Pipe and Sheet.—The demand for these materials exhibits little improvement, and jobbers complain of almost unexampled dullness in this branch of trade. Prices are inclined to weakness.

Spelter.—Prices have turned somewhat for the better and 3.60¢ @ 3.65¢ seem now to be inside rates for ordinary Western brands, as against fairly free offering at 3.50¢ @ 3.55¢ a week ago. Sales here have been moderate and the demand has shown little, if any, improvement, but business at primary points is reported as being livelier, which, together with some reduction in output latterly, seems to be chiefly accountable for the advance. Asking prices for small lots of Western Spelter from stock have advanced to 4¼¢, yet ¼¢ less than this may still be obtained in some quarters.

Antimony.—The jobbing trade has been of fair proportions and sufficient to keep the market steady at 10¾¢ @ 11¢ for Cookson's, and 10¼¢ @ 10½¢ for Hallett's, in small lots.

Aluminum.—The following are current quotations: No. 1 Aluminum, over 98 % pure, 75¢ ℔ lb in small lots; 68¢ ℔ lb in 100-lb lots; 65¢ ℔ lb in ton lots; No 2 grade, over 94 % pure, 73¢ ℔ lb in small lots; 65¢ ℔ lb in 100-lb lots, and 60¢ ℔ lb in ton lots. A reduction in list prices of manufactured Aluminum is noted in another column.

Tin Plates.—A somewhat better business is noted in orders for forward deliveries, but it has been of a fitful character and due, perhaps, to exceptional causes. Low prices have ruled in nearly all instances where round lots were involved, and there is no appearance of any decided improvement in the market. Business has been, on the whole, decidedly disappointing. Orders for spot goods are confined almost entiely to moderate quantities for the supply of immediate needs. But even these are sometimes found difficult to fill where an assorted lot of Plates is required, so low have jobbers' stocks run down. Never before, it is said, was there so much "hunting round" going on in order to beat up trade, and with such slim results. Prices are soft all along the line, particularly in Roofing Plates, the demand for which is much below the average, even for the present off season of the year. In fact, absolute prices are not really quotable, as they depend entirely upon size and desirability of order and the presssure or otherwise to sell; but it may be safely said that concessions on quoted rates may be almost invariably secured, particularly on cash orders.

A London cable dispatch of January 31, 1894, to *The Iron Age* reports that business in the British Tin Plate market has been small and the demand apiritless. There has been hardly any change in prices during the week. Stocks of Tin Plates at Swansea are about 260,000 boxes. Liverpool prices are quoted as follows:

IC Charcoal, Alloway grade	12/3 @ 12/9
IC Bessemer Steel, Coke finish	11/ @ ....
IC Siemens " " "	11/3 @ ....
IC Coke, B. V. grade, 14 x 20	11/ @ ....
Charcoal Terne, Dean grade	10/6 @ ....

Sheet Iron.—There has been more inquiry for Black Sheets, especially those of light gauge for tinning purposes, the demand for these latter exceeding the supply. Otherwise business is dull and prices low and irregular. Galvanized Sheets are in good supply and fairly steady in price, but the demand is only of moderate proportions. Makers hope, however, for a stimulation of business as spring approaches.

Fire on January 26 destroyed one of the buildings of the Indiana Mfg. Company's works, Peru, Ind., together with its contents, consisting of finished Refrigerators. The loss is said to be covered by insurance.

Chicago Report.

Scrap.—Cast is in fair demand, but all kinds of Wrought are very quiet. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per ℔
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	7.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—There was a little spurt for a few days during the cold snap, but trade has fallen off again. Carload lots of 12 net tons or over are nominally quoted as follows, but these rates can be shaded about 50¢.:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

The Pittsburgh Brass Company of Pittsburgh, with works in Allegheny, Pa., have been placed in the hands of a receiver. In regard to this action, we are advised that a judgment was entered against the firm because of the uncalled for action of a very small stockholder, who was endeavoring to hamper the management for purely personal motives, and it was feared by the officials of the firm that his action might be misconstrued and lead to action on the part of some creditors, which might jeopardize the interest of others and of the stockholders as a whole, and that under the circumstances the rights of all parties would be best conserved by placing the concern in the hands of a receiver. Application was therefore made, and Jos. McNaugher, vice-president of the company, was named by the courts as receiver. The business will be conducted as usual, and it is believed that all claims will be satisfied within a short time. The good assets of the company are stated to be not only considerably in excess of outside liabilities but of the entire capital stock as well, amounting to $250,000.

CONDITION OF THE

Hardware Trade.

REPORTS RECEIVED from the trade generally agree in referring to the improved condition of business. There is certainly in many lines an increased demand, and in general Hardware the trade are beginning to place orders more freely than for some time. The volume of business is, however, only moderate, but the fact that it is increasing is an excellent indication and all that can be expected under the circumstances, inasmuch as the gradual improvement and return to normal business conditions is all that can reasonably be looked for. In the matter of prices it is noticeable that there is apparently a slight reaction from the extremely low figures which have ruled on some staple goods. In the general line of Hardware the market is not strong, and the effect of low raw material, reduced wages and dull business is shown in the prices on some goods. The influence, however, of diminished production in relatively increased costs is felt, and with a moderate volume of business manufacturers find that they cannot produce goods as cheaply as when running to their full capacity. They are also scrutinizing their costs closely and are more careful than has been their wont to secure remunerative prices. The financial condition is certainly more satisfactory than for a long time, and February, on the whole, opens with a brighter outlook than any month during the past half year.

Advices from Chicago.—The Shelf Hardware jobbers report a steadily increasing trade. The bulk of this business is still in the line of orders for future delivery for seasonable goods and for stocks of staple goods. Country merchants are becoming convinced that staples may be higher and are buying as though they believed an advance was imminent. Their orders are consequently more numerous and heavier than for a long time and carry with them some straight Hardware for sorting up. Some large jobbing houses are reporting good trade in regular Hardware, but it is shrewdly surmised that the business thus secured is at the expense of prices. The heavy Hardware trade is spasmodic, days of excellent business being followed by periods of dullness. The general average, however, shows an improving condition of affairs, which will undoubtedly gain in strength as spring approaches.

Notes on Prices.

Wire Nails.—The Wire Nail market is evidently in an improved condition, both in the matter of demand and prices. The manufacturers have recently been booking many orders, some of them large, and as a result the mills are well occupied. They are also receiving many inquiries, and orders continue to come in in good volume. Buyers are evidently attracted by the low prices ruling, and the improved tone of the market is likely to have the effect of making them desirous of placing their orders before a more definite advance in prices is made. In this condition of things the market has naturally assumed a stronger tone, and manufacturers refuse to accept orders at prices which were quoted a short time ago. The market continues to be represented by the quotation of $1.10, from which price a concession of 5 cents is made on large and attractive orders. During the past week some large orders have been placed at $1, but this is regarded as the lowest price obtainable, and it is one which some manufacturers refuse to meet. Manufacturers are anticipating a continuance of the demand for the next month or two, and refer to the probability of an advance in prices. The New York market is represented by the quotation of $1.20 on dock, and small lots from store are held at $1.25 to $1.30.

Advices from Chicago.—Prospects are very bright for an unusually heavy business in Wire Nails in at least February and March. A great many buyers are in the market, and among them are some very large houses whose requirements for the spring have not yet been covered. Makers are greatly encouraged by the increase in inquiries and are advancing their prices. Quotations on factory lots are now $1.20 to $1.25, Chicago, and more than one factory is stated to be so well sold up as to be practically out of the market. Jobbers are quoting $1.25 to $1.30 from stock, but an advance may be expected at any time in consequence of the heavy demand.

Cut Nails.—The Cut Nail market, under the influence of the same causes that affect Wire Nails, is in a somewhat improved condition. Trade, without being especially active, shows evidence of a decided increase and prices are also somewhat firmer without being quotably higher. The Western market is represented by the quotation of $1 to $1.05 at mill. The Eastern Cut Nail manufacturers are adhering closely to the agreement in regard to discontinuing quotations at factory, and are naming only prices for Nails delivered. The New York price is $1.05 for carload lots on dock, with the usual advance on small lots from store.

Advices from Chicago.—Business in Steel Cut Nails grows better steadily, and while orders have not been so large as in past years, they are coming in more frequently. Merchants find it necessary to replenish stocks faster than they had expected. This is leading to inquiries for larger quantities. Prices here on factory lots are now $1.05 for a 60-cent average. Jobbers quote small lots from stock at $1.20 to $1.25.

Barb Wire.—An increased activity is noticeable and manufacturers refer to the fact that they are receiving many inquiries, which leads them to anticipate an active trade during the next few weeks. Prices remain in substantially the same condition as a week ago, some manufacturers holding carload lots of Galvanized Four Point at mill at $2.10, while from others the Wire can be obtained at $2. The tone of the market is, however, a little stronger and manufacturers show a disposition to withdraw extreme quotations.

Advices from Chicago.—The inquiry for Barb Wire is very much heavier from merchants through the West. They have held off so long that they are now finding themselves obliged to buy just as they need the goods. Large buyers report that factory prices have stiffened here at least $1 per ton. Prices have also been advanced $3 to $4 per ton on shipments south of the Ohio River. The trade is looking for a further advance at an early day if the present volume of business keeps up. Carload lots of Galvanized are quotable at $2.20 to $2.25, while small lots from stock are selling at $2.30 to $2 40.

Bright Wire Goods.—The prices of Bright Wire Goods are somewhat uneven, and with the active competition between the manufacturers prices are low, the discount of 90 per cent. being readily obtainable.

I X L Scale.—The I X L Scale, manufactured by the Southwark Scale Company, Philadelphia, Pa., is sold at a discount of 50 per cent. from their revised list prices.

Tack Hammers.—The Ladies' Perfect and Alaska Tack Hammers, which are manufactured by the Troy Nickel Works, Troy, N. Y., are sold at a list price of $44 per gross, subject to the following discounts:

	Per cent.
Ladies' Perfect	25 and 10 and 10 and 10
Alaska	55 and 5 and 2½

Enterprise Coffee, Spice and Drug Mill.—The Enterprise Coffee, Spice and Drug Mill, an illustration of which was given in our last issue as manufactured by the Enterprise Mfg. Company of Philadelphia, Pa., is sold at $3.50 each, from which a discount of 20 per cent. is allowed.

Gibbs Mfg. Company.—Gibbs Mfg. Company, Canton, Ohio, are quoting the following net prices on their line of Lawn and Garden Rakes, Post Hole Diggers, &c.

Lawn Rakes.

	Per doz.
The Gibbs	$4.90
Gibbs' Canton	3.75
" Favorite	3.90
" Acme	4.75
" Crown No. 1	4.90
" Crown No. 2	5.30
" Hustler No. 0	4.25
" Hustler No. 1	4.40

Garden Rakes.

	Per doz.
Gibbs' Boss No. 14	$2.95
" No. 18	3.10

Post Hole Diggers.

	Per doz.
The Gibbs	$12.75
Gibbs' Columbia	12.00
" National	12.00
" Hustler	10 00
" Imperial	7 50

Lawn Sprinklers.

	Per doz.
Gibbs' Arc	$12.00
" Hustler	6.00

Curry Combs.

	Per doz.
Gibbs' Magnetic	$2.00

Wringers.—The National Wringer Mfg. Company, Canton, Ohio, have issued a catalogue of Wringers on which the following net prices are quoted, terms 60 days, subject to a discount of 2 per cent. for cash in ten days, delivered to any part of the United States:

No.	Per dozen.
20, Erie, 10 inch	$23.00
30, " 11 "	26.00
55, King, 11 "	27.00
2, "77," 10 "	15.50
2, Zenith, 10 inch	16.50
3, " 11 "	18 50
4, " 12 "	21.50
40, Prime, 10 "	20.00
50, " 11 "	23.60
66, Columbia, 11 x 1¾ inch	27.00
99, Pittsburgh, 11 x 2 "	30.00

Daisy Rat Traps, manufactured by the company, are subject to the same terms, and are sold at $10 per gross.

Shot.—Another decline in the price of Shot is announced by the manufacturers under date of January 29. Following are the revised prices, terms 30 days, or 2 per cent. discount for cash in ten days from date of invoice:

	Per bag.
Drop Shot, sizes smaller than B, 25 pound bags	$1.25
Drop Shot, sizes smaller than B, 5-pound bags	.35
Drop Shot, B and larger sizes, 25-pound bags	1.50
Drop Shot, B and larger sizes, 5-pound bags	.40
Buck and Chilled Shot, 25 pound bags	1.50
" " " 5-pound "	.40
Dust Shot, 25-pound bags	2.00
" " 5-pound "	.45

In lots of 2000 pounds and upward taken at one time a discount of 5 cents per bag (25 pounds) will be allowed, together with a special discount of 2½ per cent.

Aluminum.—The Pittsburgh Reduction Company have issued the following lists on Plate, Sheet and Wire Aluminum:

Aluminum Plate and Sheet, B. & S. Gauge.

Wider than ... / And including ...	3 in. 12 in.	12 in. 14 in.	14 in. 16 in.	16 in. 18 in.	18 in. 20 in.	20 in. 22 in.	22 in. 24 in.	24 in. 26 in.	26 in. 28 in.	Price per pound for polishing one side*

Elbows and Shoes.—W. Austen Obdyke & Co. and Lamb & Ritchie announce that in order to simplify and adjust prices, after February 1, 1894, their list prices for Corrugated Expanding Elbows and Shoes will be as follows, replacing all previous lists:

Round.

	Elbows.	Shoes.
2-inch, each	25¢	30¢
3-inch, each	30¢	36¢
4-inch, each	40¢	48¢
5-inch, each	50¢	60¢
6-inch, each	60¢	72¢

Square.

2-inch, each	30¢	40¢
3-inch, each	36¢	48¢
4-inch, each	48¢	60¢
5-inch, each	60¢	72¢
6 inch, each	72¢	84¢

In each of the above classes there is but one price now for each size.

Old Metals.—Old Metals are in very slow sale. The supply is much in excess of the demand, so that better prices are unobtainable. Holders, as a rule, are not anxious to dispose of material at the present low rates, and dealers are doing very little, nor are they anxious for business under present conditions. There is a moderate demand for some special kinds of Scrap Iron, required for export; otherwise the local market is lifeless. The following are the nominal prices paid by New York dealers for moderate sized lots:

Heavy Copper	℔ lb 7¢
Light and Tinned Copper	℔ lb 6¢
Heavy Brass	℔ lb 5¢
Light Brass	℔ lb 4¢
Lead	℔ lb 3¢
Tea Lead	℔ lb 2½¢
Zinc	℔ lb 2¼¢
No. 1 Pewter	℔ lb 13¢
No. 2 Pewter	℔ lb 6¢
Wrought Scrap Iron, ℔ gross ton	$7.00 @ $8.00
Heavy Cast Scrap, ℔ gross ton	7.00 @ 8.00
Stove Plate Scrap, ℔ gross ton	4.00 @ 5.00
Burnt Iron, ℔ gross ton	2.50 @ 3.00

Old Rags, Paper, &c.—The market for Rags and Paper Stock shows as yet little indication of improvement. The demand continues light, and prices weak. Those paid in the New York market are about as follows:

No. 1 White Rags	℔ lb 3¼ @ 3½¢
No. 2 White Rags	℔ lb 2¼ @ 2½¢
Mixed Rags	℔ lb ¾¢
Blues and 3ds	℔ lb 1 @ 1¼¢
Hard Sized White Shavings	℔ lb 2¼ @ 2½¢
No. 1 White Book Shavings	℔ lb 2 @ 2⅛¢
No. 2 White Book Shavings	℔ lb 1 @ 1⅝¢
Light Book Shavings	℔ lb ¾¢
No. 1 Mixed Shavings	℔ lb ¾ @ 1 ¢
No. 2 Mixed Shavings	℔ lb ½ @ ¾¢
No. 1 Printed Books	℔ lb 1 @ 1¼¢
Ordinary Mixed Books	℔ lb ½ @ ¾¢
Newspapers	℔ lb 2-5 @ ½¢
No. 1 Manila Paper	℔ lb 1 @ 1⅛¢
No. 2 Manila Paper	℔ lb ¾ @ ¾¢
Bogus Paper	℔ lb ½¢
Common Paper	℔ lb ⅜¢
Straw Chips	℔ lb ½¢
Binders' Clippings	℔ lb ½ @ ⅝¢
Jute Butts	℔ lb 1⅞ @ 2 ¢
No. 1 Jute Bagging	℔ lb 1 @ 1¼¢
Mixed Bagging	℔ lb ¾ @ 1 ¢
No. 2 Bagging	℔ lb ½ @ ¾¢
Hemp Twine	℔ lb 2 @ 2¼¢
Manila Rope	℔ lb 2¼ @ 2⅝¢
Jute Rope	℔ lb 1½ @ 1¾¢
Mixed Rope	℔ lb ¾ @ ⅞¢

Old Rubber.—The market for this material remains very quiet. New York dealers' prices are nominally as follows:

Car Springs, ton lots, ℔ lb	@ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb	@ .03
Rubber shoes, less than carloads, ℔ lb	0.02¼ @ .03⅛
Large Hose, ℔ ton	@ 9.00
White Wringer Rolls, ℔ lb	@ .04¼
White Syringes, ℔ lb	@ .05

ELTON W. CLARK of Merry & Clark, 535 to 547 West Fifteenth street, New York, importers and dealers in tin roofing plates, has returned to the city after a vacation of some three weeks, which he spent in Florida.

It Is Reported—

That Clement Hardy's Hardware store, at Richmond, Ind., was burglarized on the 19th ult. $50 worth of goods were taken.

That the contract for supplying the implements for use in the parks of Denver, Col., has been awarded to the George Tritch Hareware Company of that city.

That the Hardware store of Nathan Kenyon, Ionia, Mich., was burned out on the 20th ult.

That Henry Wallis has purchased an interest in W. D. Parker's Hardware store, at Sampton, Iowa. The firm will hereafter be known as Parker & Wallis.

That the T. B. Rayl Company, Hardware merchants, have been incorporated at Detroit, Mich. The capital is $60,000, of which $42,000 has been paid in. The incorporators are Thomas B. Rayl, Dudley W. Smith, Alexander Paton and James Wilkie.

That Lamb & Folsom have purchased the Hardware stock of J. W. Cole & Son, Dryden, Mich.

That the Hardware store of A. M. Avery, Pensacola, Fla., was burglarized on the 14th ult. A number of Revolvers, Saws, &c., were carried away.

That burglars broke into the Hardware store of A. B. Rathbone, Oakfield, N. Y., on the 16th ult. and blew open the safe. They got about $5 in small change. The Hardware stock was not disturbed.

That a certificate of incorporation has been issued to the K. J. Hoge Company, Wheeling, W. Va. The concern will deal in Hardware, Implements, &c. A capital of $30 000 is authorized. The incorporators are K. J. Hoge, G. M. Brown, William Rogers, L. J. Rogers and Arthur Rogers.

That Grier Bros.' Hardware store at Dubois, Pa., was destroyed by fire on the 11th ult.

That the Hardware store of John M. Chalfant, Kennett Square, Pa., was robbed on the 10th ult.

That Fred. S. Sterling has purchased the interest of his partner, H. C. Abell, in the Hardware and Tin business at Lowville, N. Y., and will hereafter conduct the store alone.

That the Hardware store formerly owned by Mason & Richardson, Cambridge, Iowa, has become the property of Willard & Co.

That E. Gordon, Hardware merchant, Sherwood, Mich., has nearly completed the erection of a new Hardware store.

That C. A. Tope and Wallace Beamer have bought the Hardware store of Tope Bros., Dell Roy, Ohio.

That M. F. Redmon has retired from the Hardware firm of Myer & Redmon, Osceola, Iowa, and has gone to Omaha, where he will be connected with the Avery Planter Company. Mr. Redmon's interest has been purchased by Ruby Myer, son of the senior partner, by whom the business was established in 1867.

That O. Gard has opened a new Hardware store at Fowler, Ind.

That M. Fishel has purchased the P. L. Barlow Hardware stock at Neosha, Mo., and has opened up for business at the old stand, with Mr. Barlow as manager.

That J. J. Rutka, who for many years was in charge of the Prusia Hardware Company's wholesale business, at Fort Dodge, Pa., is now engaged in the retail Hardware business at Grand Rapids, Mich.

That T. A. Murphy, Trenton, Mo., will re-enter the Hardware business about February 1. Mr. Murphy for the past two years has been Mayor of Trenton.

That the Hardware stores of H. Wilson and Nebo Hardware Company, Roodhouse, Ill., were destroyed by fire on the 14th ult. The losses are almost covered by insurance.

That L. L. Smith has concluded to discontinue the Hardware part of his business at Princeton, Iowa, and has moved his entire stock of Shelf Hardware to Allerton, where his principal store is located. He will, however, continue to retail Implements at Princeton as heretofore.

That the Lobeck-Linn Hardware Company, Omaha, Neb., held their annual meeting on the 9th ult. and elected the following officers for the ensuing year: C. O. Lobeck, president; C. H. Linn, vice-president; E. A. Pollock, secretary and treasurer.

That the Hardware store of Doak & Wolfe, Grenada, Miss., was badly damaged by fire on the 13th ult.

That W. E. Platner, for many years in the Hardware business at Mount Vernon, Iowa, has disposed of his stock to Messrs. Powers & Chambers.

That H. N. Askam has purchased a one-fourth interest in the Hardware and Implement store of Brobst & Porter Bros., Findlay, Ohio.

That John Schoutag has bought the Hardware stock of Amos Lamb, South Royalton, Vt.

Books as Helps.

It is a mistake to suppose that most practical men despise such knowledge as they can gain from reading. It would be more just to say that they welcome such books as are real helps. It is true that some whose educational advantages have been restricted are often discouraged and disgusted with books, because such as treat of the subjects they wish to inform themselves upon, and from which they have expected much, are written in a style not suited to their needs. Not being trained in mathematics, books, to be useful to them, must not be loaded down with mathematical discussions, no matter what may be their value to those who can understand and apply them. Mathematics has methods and a language of its own; and it is of no more use to one not conversant with its notation and skilled in its application than a German book would be to one who can read and speak only English. It is not just, on this account, for practical men to assume that the vast fund of knowledge existing in mathematical books is useless because unavailable to such readers. On the contrary, young men cannot be too strongly urged to pursue the study of mathematics, which opens the way to much that otherwise will forever remain inaccessible to them. Many a man bites off more than he can chew in the purchase of books. After getting a book he often finds, to his great disappointment, that the author has written for a different class of readers. Too many, thus disappointed, rashly conclude that books such as they need cannot be found and abandon the search. But it is rare in this age of printing that perseverance in spite of such disappointments will not discover books affording material help.

Exhaust or Plenum Ventilation.

Opinions still differ upon the choice of methods for forced ventilation. Some favor the method of exhausting the air from apartments to be ventilated, the impure air thus removed to be replaced by air flowing in from without under normal atmospheric pressure, others maintaining that the best way is the plenum method, in which pure air being mechanically forced into the space to be ventilated, forces out the impure air; while still others maintain that the latter method is not only the most effective, but that if the impure air be mechanically exhausted while pure air is at the same time mechanically forced in, thus combining the two methods, the results are better then than by either of the two former methods used by itself. Now, while good arguments in support of each of these methods may be forthcoming, it is a fact that neither of them gives uniformly good results under all conditions; and the suggestion is hazarded that under conceivable conditions and restrictions any one of these methods might be better than either of the others. Those who succeed best in erecting ventilating apparatus are such as, not slavishly wedded to any system, intelligently select their system on account of its adaptation to the peculiarities of the special case in which it is to be applied. Some very unwelcome results have followed rigid adherence to some of the modern systems, for which the energy and persistence of their promoters have secured adoption in buildings wherein they never ought to have found a place.

A Noble Example.

The story of the career of the late George W. Childs of Philadelphia is one that affords a splendid illustration of the possibilities which, in the United States, more than in any other country in the world, lie before every boy and youth who possesses in some degree the qualities which marked the dead philanthropist. Without any advantages of birth or education; by dint of sheer industry, integrity and perseverance, he rose from the humble position of office boy in a book store, at $2 a week, to one of the greatest eminence and influence among the private citizens of this country. While choosing to remain a private citizen he yet became the trusted friend and counselor of Presidents, statesmen and merchant princes. Mr. Childs with one hand amassed great wealth, every dollar of which was "clean money," and with the other hand dispensed it freely in deeds of beneficence and charity. The strict and transparent integrity which marked his entire career, combined with his tender hearted love for humanity, gained for him the universal esteem and affection which found expression in the glowing tributes to his memory which have been published since his death. Mr. Childs was a "self made" man in the best sense of the term, and his life should serve as an inspiration to generations yet to come.

Garbage as an Illuminant.

The disposal of city garbage is a subject which has offered a fertile field for discussion in the United States for many years. It would appear that the utilization of city garbage would be the more profitable consideration if we are open to availing ourselves of the experience of certain municipal authorities on the other side of the water. In Paddington, we learn, a London district which contains about 100,000 inhabitants, the garbage furnishes sufficient power to light all the streets of the district and at the same time reduces very materially the cost of the electric light for domestic use to the householders. About 30,000 tons of garbage are burnt annually, and, on experiment, it was found that three tons were equal to about one ton of coal in making steam, so that the garbage of the district is equivalent to 10,000 tons of coal annually for electric light service. A similar arrangement has also been tried successfully in the town of Southampton, England.

The Water Supply of Congress.

How many people, queries the Washington *Post*, know that out by the Greenough statue of Washington, east of the Capitol, is a vast and cavernous reservoir? Not one in a thousand, but there it is, down in the bowels of the earth, and covered deep beneath the smooth surface of asphaltum. Away back in the thirties Congress purchased a spring over east of the present site of Howard University. It is now at the bottom of the unused distributing reservoir. From it pipes were laid to the Capitol, and in a pond east of the building the water flowed and was held for the use of the early Solons of the hill. In 1876 the reservoir was arched over and covered in, but there it is, and if Congress has been neglectful of the city's interests as to a water supply, the reason is not hard to find. Congress has its own private tap. Pipes run into the Capitol, furnishing the boilers, coolers and water for cleaning purposes. There is an overflow pipe that runs into the pretty little grotto below the Senate wing at one side of the main sidewalk and tinkles over the mossy bank in a miniature cascade.

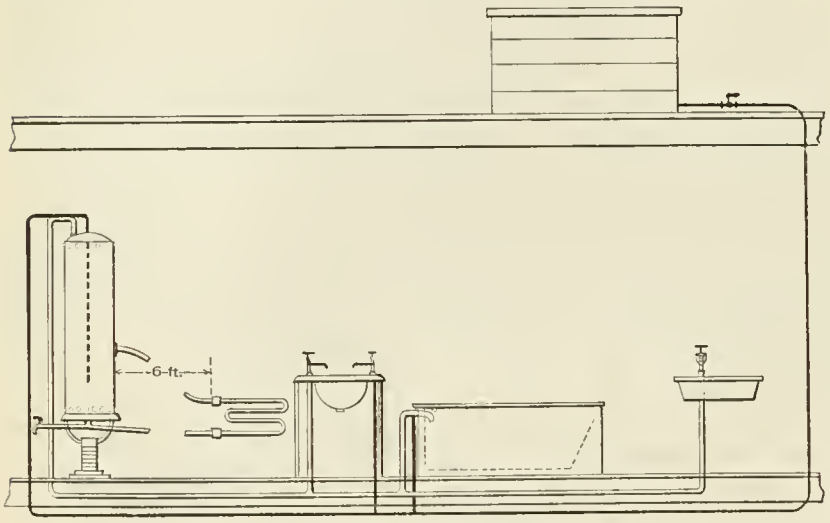
The New York Rapid Transit Commissioners have approved a plan for an underground railroad in the city.

THE LETTER BOX.

What Caused the Collapse?

From H. D., *New York*.—I recently set a range boiler which collapsed 18 hours after water was turned on and would like *The Metal Worker* and its readers to give their opinions as to what caused the accident. The boiler was a 40-gallon light weight copper boiler. Cold water was supplied by a ¾-inch lead pipe from a tank in the attic, the pipe running from tank to cellar and across underneath bathroom floor and tapped there to supply cold water to the bathtub and wash basin, as shown in the sketch. The boiler is in the corner of the bathroom and the supply pipe came up through the floor and connected to the center connection on top of the boiler in the usual way, with the tube inside of the boiler running down to within a short distance of the bottom of the boiler. The hot water pipe was connected to the top of the boiler in the usual way—to the coupling, about 4 inches from center. The boiler was connected by ¾-inch pipes to a double pipe water faucet. From the stove to the boiler is about 6 feet. The boiler was full of water when it collapsed, as the parties had been drawing hot water from the faucet in the kitchen shortly before it occurred. A rumbling noise was heard in the boiler a while before it collapsed. A natural gas fire, very hot, was burning in the stove and the water front is very close to the burner. The boiler, instead of being bulged out, as usually occurs when an explosion takes place, was drawn in all around the top just below where the top is riveted to the body, and looked as if a rope had been put around it and forcibly tightened up until it caved in. The boiler was full of very hot water, which spurted out of the hole made by the collapse. The top of the boiler sagged down with such force as to tear the lath from the wall where the tacks were screwed to them. The boiler must have been quite hot, for the color of the copper is changed at the top or the hottest part. I inclose a sketch showing the location of the fixtures. I am at a loss to tell what caused the accident, as I never saw anything like it in 13 years' experience, and am blamed by the customer for whom I did the work. The order for the range boiler and connections was filled by a traveling man, who is a plumber, he knowing what the parties wanted.

Note.—Our readers are again appealed to for information. It is quite possible the collapse was caused by steam in the boiler due to great heating capacity of the pipe water front and lack of pressure in the supply. From the top of the boiler to the level of the water in the tank, as shown in the illustration, would hardly be over 6 feet. Using the thumb rule of water pressure of ½ pound to each foot in hight, a pressure of only 3 pounds would be exerted at the top of the boiler by the supply. The large water heating surface exposed by the construction of the water front would enable steam to be generated freely and passed to the boiler. The accumulation of steam at the top of the boiler would drive the light pressure water supply back to the tank and would discolor the copper, as mentioned. Drawing off hot water at any faucet would let cooler water enter the boiler and pass to the water back, when the generation of steam would be stopped and the steam from the boiler would follow along the hot water service pipe, both actions tending to condense the steam and create a vacuum. If the vacuum was of considerable size it would not be filled with water before the atmospheric pressure of about 15 pounds to the square inch on the surface of the light copper boiler would cave it in. The trouble can be avoided in future by placing a vacuum valve at the top of the boiler to let in air when necessary or by running a relief pipe from the top of the boiler to the top of the tank and turning the end over the tank, but not into the water. This would let the steam escape and remove the cause of the collapse. Such experience is not unusual where the water pressure is no greater than would be with a tank placed so little above the top of the boiler.



What Caused the Collapse?

Roofing Queries.

From J. H. W., *Williamsport, Pa.*—The subject opened by "S. P. K.," in *The Metal Worker* of January 27, is a good one, for when a man knows the exact cost of his work he is not apt to cut prices below that mark, as has been done in many cases. We put our tin together in strips 20 inches wide, using 28 sheets to a strip or roll, and making four rolls to the box. The quality of the tin governs the time required to edge a box, the so called old style having lumps on the corners that must be removed before they enter the machine. The cheaper grades have raw edges and are not square, so that more time is required to prepare and edge them. My answer is based on average material and style of roof. A box of tin can be edged in 30 minutes. It can be put together with a mallet and soldered off before rolling up in from one and one-half to two hours. We lay no sheet-at-a-time flat seam roofing here, but put it on in strips. In soldering for standing seam about 2½ pounds of solder to the box is used, but for flat seam work 5 pounds. A fair day's work in standing seam roofing is about 500 square feet, and about 200 square feet of flat seam roofing when put on in strips, and about 5 pounds of solder to the box would be required to solder the seams. The edges of the roof are generally finished by cutting the tin 1½ inches longer than the dripboards, then bending it over and nailing it for flat seam work. For standing seam edges, the seams are flattened down with the lock on top so that the water can run out, the edges trimmed and bent down and nailed the same as flat seam work. Now let some other roofer give his account of getting the tin ready and putting it on, How about painting it? How soon should it be done? Should both sides be painted or only the top?

Fooling the Gas Man.

From E. K. S., *Brooklyn, N. Y.*—There is food for reflection in the following clipping from a New York paper: "It's a very funny thing," said a housekeeper the other evening, "how the gas companies regulate their bills. A neighbor of mine cooks her breakfast by gas and doesn't light it again until night comes. Her gas bills average $8 or $9 a month. Now, I cook three meals a day by gas and leave a jet burning all night so I can get hot water to dilute condensed milk with for the baby. My gas bills don't go above $5.

I don't know what makes the difference, but I suspect my neighbor bought her gas stove from the gas company, so they know she uses one. They don't know I have one. That must be it."

The ways of gas corporations and their collectors are dark and mysterious. Do the companies pay the latter on commission, allowing them to screw as much out of their innocent and unsuspecting victims as possible, regardless of the meter? It looks as if this was the case in the good town of Brooklyn, at any rate, where the canny housekeeper above quoted does most likely dwell. I live in the City of Churches and have had a similar experience. Some months since I moved, with my family, into a small flat. At the end of the first month the gas collector appeared with a bill for $2.65. This was paid without murmuring. The second month ended and brought a score of $3 75. A gentle protest accompanied payment this time. But when the third monthly account was found to foot up to over $5—with no increase in the expenditure of gas, but rather the reverse, for I had been careful to economize it in every way—the worm turned. Vigorous objections to payment were made; something was said about "robbery" and "fraud," and the man was told to take the something meter out of the house, as only oil would be burned forever after. Result: Apologies; "some mistake;" bill taken back for correction, and returned at—$2! Never since has it been over that sum, but fluctuates between $1.50 and $2. Yet no economy is used. Gas is burned *ad libitum*, and a gas stove, for night use, has become one of the features of my establishment, not obtained from or with the knowledge of the gas company, of course! Perhaps this little story may interest some of *The Metal Worker* readers who may be groaning every month under the burden of a weighty gas bill As to the strict morality of the transaction, I shall say nothing nor make any defense. When one has to deal with robbers one must, in self defense, use their weapons. But what I should like to know is: What is the use of a gas meter, anyhow?

Heat Proof Black Wanted.

From A. J. T., *Boston, Mass.*—Will you please inform me in *The Metal Worker* what to use to coat the front end of a locomotive boiler that will keep black and glossy and will not wash off?

Note.—We submit this question to our readers, as no doubt some of them can answer from experience. A good quality of asphaltum varnish will probably answer the purpose if the heat is not too great. If the requirements are made known to some manufacturer of such goods it is probable that something that will meet them can be produced.

Fails to Bake on Bottom.

From J. F. T., *Meadville, Pa.*—I notice in the Letter Box of January 20 that "W. S.," Guelph, Ont., complains that he is sometimes annoyed by having stoves that would not bake at the bottom of the oven. Since natural gas has come into use for fuel it is not an uncommon thing at all here to have customers make this complaint, but we have no difficulty in remedying the trouble. Nine times out of ten the trouble comes from closing the check damper in front of the stove and shutting off the air supply. It is almost invariably one of the following reasons that causes the trouble: Either closing of the air draft supply, or soot, sand or mortar have stopped the draft of the pipe at flue hole in the chimney. I have, however, in my experience had some trouble with stoves not baking well on the bottom when other than gas was used for fuel—that is, coal and wood. The cause of it has frequently been that cold air was drawn into the stove and into the flues through the joint where the bottom plate joined the side of the stove; the joint not having been properly puttied, or having opened from some cause, allowed the admission of cold air into the flue or between the bottom of stove and oven plate. If the oven damper closes tight, thereby causing the hot air and combustion to pass down and between the bottom of stove and oven plate, the stove will bake—it can't help it. Perhaps "W. S." has queer people to deal with in Guelph, such as are found in many other places. I have sold stoves to people and had them come back and complain and find fault about the stoves not baking, when I knew positively that they were lying, for I have gone and tried the stove and baked potatoes or something to convince them. They were of the same opinion still, and did not want to be convinced. In other words, after getting the stove home, for some reason (they probably knew what it was) they wanted to change the stove and could find no other reasonable excuse for wanting to change, so blamed the poor, mute stove for not behaving nicely and doing its work properly.

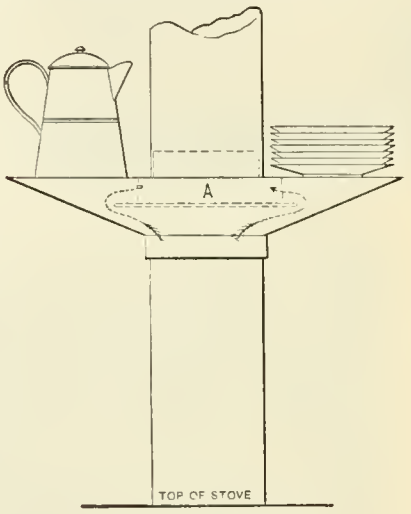
From A. P., *Port Jervis, N. Y.*—In answer to "W. S.'s" question in *The Metal Worker* of January 20, about stoves not baking on the bottom. This trouble occurs almost entirely in new stoves (except where flue strips are not in place, &c.). After a stove has been used the top oven plate becomes covered with soot and ashes, which retards the heat, and the bottom of the stove becomes covered with soot, which retains the heat against the bottom oven plate. This generally makes the range bake evenly. To remedy the baking at once either put some plaster of paris on the top oven plate or put a piece of sheet iron in the oven at the top a little wider than the oven and spring it in to hold it in place. This forms an air space, which has the same effect as the plaster of paris. This remedy I have tried and found satisfactory.

Better Marked Stove Repairs.

From J. F. T., *Meadville, Pa.*—I want to relieve my mind of a little matter which I have been thinking of doing for some time, in reference to getting stove repairs for my customers. I find a great deal of trouble and annoyance from the fact that scarcely one of the manufacturers from whom I order repairs ever marks a repair piece so that one could tell to what stove it belonged. Now, what I would think would be the proper thing for the stove manufacturers to do would be to write plainly on a tag secured to the repairs, or on a printed label pasted on each piece, the name and number of the stove to which the piece belongs. I have not any doubt but that every retail dealer has experienced more or less trouble in this matter as well as myself. Many times people do not call for castings they have ordered, and a dealer forgets to what stove a fire back or grate belongs, and the result is these accumulate, when if they were marked he could make use of them; and sometimes others might want just that piece and he orders it when he has it in stock, but does not know it.

Improved Stove Pipe Shelf.

From EPICURE.—I send *The Metal Worker* a sketch of a very effective stove pipe shelf, which also has the advantage of being made of sheet iron, so that any tinner can make it. The ordinary open work cast iron pipe shelf depends upon what heated air arises from the stove, and in some cases this is not enough to keep articles of food in good condition



Improved Stove Pipe Shelf.

for the table any length of time. I made one of these for my own use, and made it about 16 inches square, with a 6 inch pipe in the center, and think that is about the right size. The sketch with the description clearly shows the construction. The lower section can be cut on any desirable flare, and the upper section or shelf is hemmed over the edge of the lower section to unite them. Pipe collars, to allow the stove pipe to enter inside at the bottom and go over the collar on the upper side, are provided the same as for any drum stove. It can be made round, but that will not afford as much room for the dishes as at the corners on a square shelf. A deflection, as shown at A, may be put in to force the heat to the edges, but it will be found to surpass any ordinary pipe shelf without this from the natural conduction of heat by the metal. At the time that I made the one mentioned I was not in business, and now I am in a city store and cannot give any particulars about the sale, but think a number could be sold by any country shop who kept them in sight of customers or on a stove where they would show the heating qualities. Perhaps I am generous not to patent it, but what is my loss may be some of your readers' gain.

Flat Seam Roofing Questions.

From G. R J., *Savannah, Ga.*—Seeing the queries of "S. P. K.," in *The Metal Worker* of January 27, on standing seam roofs, I should like to have about the same information on flat seam roofing. Of course in putting the tin

together in rolls the time would be the same and the solder would be the same in flat as for standing seam, but is it good practice to put flat seam roofs on in strips? Should it always be put on one sheet at a time? How many nails should be used to the sheet? How long does it take to prepare a box of tin for roofing when all four sides are edged and all four corners are notched? How much time is required to lay a square, or rather what is an average day's work in flat seam roofing, when it is put on a sheet at a time, and also when it is put on in strips. How much solder to the box is required in soldering a flat seam roof both ways? These questions have long since been settled in the minds of a good many of the roofers, but I am satisfied that an interchange of opinion and practice will be a revelation to some who carry on the business, and if a better understanding and a true knowledge of the cost is in the possession of some who are now bad competitors, better prices can be got and better work be done. I hope some of my fellow roofers will take the trouble to answer my questions and I shall be glad to give my experience on the subject later on.

White Japan Wanted.

From H. S., *Gardner, Mass.*—Will *The Metal Worker* tell me how to get a white paint or paint of light color, to be used on a pan that sometimes holds water and sometimes kerosene, though the kerosene would always be in very small quantities. The pan is occasionally subjected to a little heat. I am at present using white lead, varnish and turpentine, which does not give satisfaction.

Note.—Any manufacturer of japans can furnish a white japan which is applied in one or more coats and dried for several hours in an oven at a temperature somewhat above 200°, and which will probably answer the purpose.

Dead Black Finish.

From J. H. W., *Brooklyn, N. Y.*—In answer to the inquiry of "E.E. H.," in *The Metal Worker*, February 3, for a dead black finish, he will find it in Enameloid No. 4, made by the Celluloid Zapon Company, 41 Barclay street, New York.

The New York Trade School had visitors last Monday from Chicago and Boston. Chas. H. Webb came in the interest of the Armour Institute of Chicago, to gather information for the addition of the painters' trade to those taught. Supt. S. F. Hubbard and Plumbing Instructor W. H. Haskell of the North End Union of Boston gathered information as to the methods and appliances used in teaching the plumbing trade.

A German technical paper publishes the following recipe for the preparation of a cleaning soap for bronze, brass and silver ware: Fifty parts finely cut cocoa soap is by heating dissolved in a sufficient quantity of water to form a thick paste. Again 5 parts crocus are stirred up with a little water and 1½ parts carbonate of ammonium are mixed with it and stirred into the soap paste, after cooling. The obtained paste is preserved in a stone jar, well tied up with bladder or parchment paper.

Coke in the Foundry.

From a paper on "Coke" read by C. K. Pittman of Chicago at the last meeting of the Western Foundrymen's Association, we reprint the following extract:

The heart of the foundry may be said to be in the cupola. Most of the troubles that come originate there. There is no part of foundry work that demands such close and intelligent care. If the cupola is not in proper condition or not adapted for the work, if the iron is not of proper grade, if the coke is too light or too impure, if the flux is unsuitable, if the blast is too intense or too weak, if the supply of air is too great or too small, the effect will be seen in the finished casting. The overlooking of one small point may spoil the whole work.

To lay down a rule or set of rules for the use of coke in a cupola is not possible. The efficiency of the furnace depends upon the proper adjustment of the parts and the accurate working of all to one end. It is necessary to be personally acquainted with the cupola and the blast furnace. A man who was practically and theoretically familiar with a certain blast furnace once said, when many miles distant from it: "If you will tell me the condition of the atmosphere, the strength and direction of the wind at the furnace to-day, I will tell you what grade of iron is being produced." This claim was in a large measure justified by test. The chemical reactions that take place in the cupola are imperfectly understood. We know enough, however, to appreciate the importance of a full knowledge of the constituents of iron and coke, and it may be added there should be a similar knowledge of the flux that is used. Only by such knowledge can the proper kinds and proper proportions be known. The use of an improper flux and even an excess of a suitable one may produce the same effect that excess of sulphur in coke or iron does. To what extent iron will absorb sulphur from the fuel is not known, but when the coke contains 1.5 per cent. and probably 1.25 per cent., the iron will be deteriorated. It is probable that a better understanding of the reactions of iron, coke and flux will make it possible to use without injury a coke higher in sulphur than is now thought possible. Some recent experiments have been made in this direction, but nothing definite has been reached. Apparent progress has been made, however, in methods for the elimination of sulphur from the molten iron, which may have a bearing upon our problem. Another factor in cupola work that most closely affects coke is the blast. It has been clearly demonstrated that the use of hot blast saves fuel, but the working of most foundry furnaces is so intermittent that its use is hardly feasible. It has seemed that too many foundrymen fail to appreciate the real necessity of the proper adjustment of the air supply that enables the coke to do its work. The pressure of the blast should be sufficient and the amount neither too great nor too small. There is a waste of both coke and iron in either case. If the pressure and amount of air are not enough the melting will be retarded, the fuel will be consumed, but will act too slowly, the metal is deteriorated, runs thick and the castings are inferior. If the blast is too strong the coke is consumed too rapidly, and a portion blown out unconsumed. The intensity of the heat beyond what is needed hardens the iron, is apt to induce chemical action between iron and the impurities of flux and coke and cause the thin liquid slags to attack the lining. Thus the full value of the coke is utilized only with the proper intensity amount and uniformity of blast. The blast moreover must be regulated by the character of the iron, of the coke and the flux. If the coke used is hard and firm the blast should be stronger than if a lighter and more porous coke be used. Many a good coke has failed because the blast was not properly regulated.

It is an error to suppose that sulphur can be burned out by intensity of heat. The analysis of gases escaping from blast furnace chimneys shows no sulphurous vapors, and I think none containing phosphorus. Upon the same principle, in burning coke about one-half of the sulphur of the coal is driven off if the heat is regular and not too intense. If it be too intense the sulphur seems to have chemical affinities developed that cause it to enter into combinations upon which the heat has no effect.

It will naturally result from what has been said that from inattention to details there must be a large waste of coke in cupola work. The loss through breakage in transit and careless handling is small compared with that due to faulty methods. In England the average consumption of coke in cupola work is 280 pounds with a minimum of 175 pounds per ton of iron melted. In this country the best practice puts the minimum between 150 pounds and 225 pounds, though this is perhaps too small. What the average is I cannot say. In what has been said in a general and rather desultory way, the object has been not to criticise, but to call attention to those more obvious points in foundry practice that may be improved, as they appear to a layman. The use of coke is so intimately bound up with all other materials that enter the cupola, and one so depends upon the others that no rule of action can be formulated for one that does not apply to others. Considering coke alone we can say that so far as we now know it is the best fuel for the melting of iron in the cupola, because it is, as a rule, more pure and uniform, and, when properly used, will give the maximum of efficiency. When we ask what the best coke is we can hardly answer in a word. We must take into account the kind of work to be done, the iron to be used, the flux that is best adapted and the conditions of the blast. We must know in a measure what our iron contains, what are the constituents of flux and coke. We should know as much as we can of the chemical affinities and relations of these constituents. Then we can say with some degree of accuracy whether Connellsville or Pocahontas is best, whether New River or West Virginia will be most efficient and economical.

Sir Douglas Galton, the eminent British scientist, in a paper on "Ventilation, Warmth and Light," recently read by him at the Parkes Museum of Hygiene, London, referred to the ventilation of the English public schools as a disgrace. While children were compelled to attend the schools, he said, the lack of proper ventilation in the school rooms made them dangerous to their health.

The boiler maker with oratorical proclivities, says the Buffalo *Courier*, should have little trouble in riveting the attention of his hearers.

ROOFING AND CORNICE.

Sheet Metal Lathing and Fire Proof Partition.

Turnbull & Cullerton, 195 La Salle street, Chicago, are manufacturing and introducing to the trade a new form of sheet metal lathing which was patented by George A. Turnbull, January 2, 1894, and assigned to Turnbull & Cullerton. This lathing is constructed of soft steel, and corrugated in the direction of the length of the plate, which is longitudinally slitted at suitable intervals between adjacent corrugations, the metal being turned out at the margins of the slits. Thus free lips are produced which permit the passage of the mortar, and guide and control it as it passes through the perforations so as to prevent waste and to cause the mortar passing through adjoining slits to unite upon the back of the interposed corrugated strip to form a key. The construction is such that the key is not subjected to the action of any sharp edge or part of the metal whereby the key would be cut or weakened. In Fig. 1 is presented a horizontal section showing curve of bridge, hight, retentive lips and openings. In Fig. 2 is presented an edge section, showing comparative hight of bridge and mortar crevice or opening. This lathing is made in sheets of ½ square yard each, and can be cut to fit any opening, angle or curve, as may be desired. As this lathing has large key openings and a small percentage of dead surface, the plasterer is enabled to cover a large surface with a great saving of material, as a heavy first coat can be applied, and then finished with as good results as with three-coat work on wooden lath. While this lathing can be applied to wooden studding in the usual manner, when a fire proof partition is required it is constructued as shown in Fig. 3. The Monarch fire proof partition (on which a patent has been applied for) is built on steel grooves of special design, and is securely held in position by adjustable wrought iron foot and head plates made for the purpose. A foot holder is shown in Fig. 4. A false jamb is then secured to this frame work by means of iron staples, to which the door jambs may be easily attached. The steel stanchions having been placed in position they are covered on both sides with the sheet metal lath, being secured with barbs cut on the flanges of the upright grooves, which are driven through the lath and clinched down on the outside, thus holding the sheets straight and solid. As these partitions are constructed with 1½-inch channel steel, when finished they are only 2½ inches thick. In addition to the lightness of this partition it is pointed out that as it is hollow it will not conduct sound, besides affording ample space to convey speaking tubes, electric wires, &c.

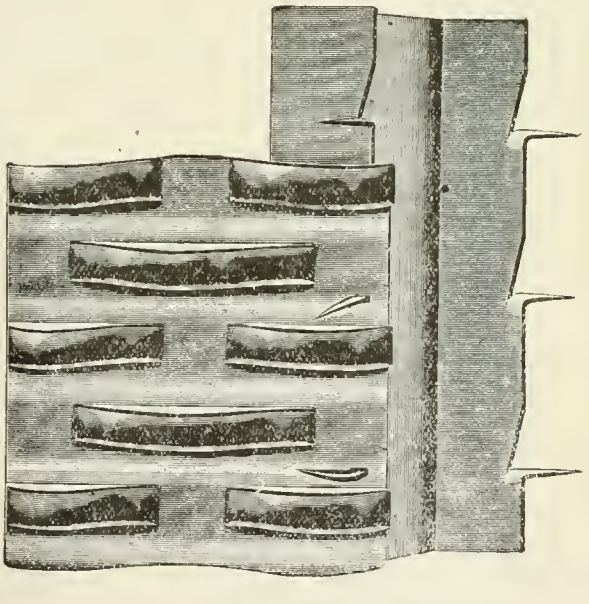

Fig. 3.—Fire Proof Steel Lath Partition.

The United States Consular Agent at Londonderry, Ireland, in a recent report to the State Department, makes interesting reference to the appreciation of Pennsylvania roofing slates in his consular district. One of the largest building contractors in Londonderry, who had received a cargo of their slates, had informed the agent that for uniformity of dimensions, quality and color (deep sea green) he had found it superior to any other slating imported. It was entirely free from pyrites, possessed an extraordinary toughness, and was found to be the most desirable slate for every description of roofing in exposed situations. For these reasons, the consular agent believes, the sale of American roofing slates could be pushed, not only in Ireland, but throughout Europe.

The Development of the Iron and Steel Roofing Industry.

Not long since we drew attention to the remarkable increase in tonnage of iron and steel roofing produced in the United States at the present time compared with 12 years ago, at which time there were only a few iron roofing concerns in existence. Now they are distributed all over the country. In the early days of the industry each manufacturer had some special design of roofing upon which his attention was concentrated, and these specialties are still before the trade, but so numerous are the designs patented and so good are the claims of each, generally speaking, that the manufacturer himself is often puzzled as to which special kind of roofing he shall push the sale of in preference to others. When each maker had only one or two lines to offer a four page circular printed in two colors was considered an enterprising step, but now the smallest concern will not hesitate very long about publishing 40 to 80 page catalogues, which are usually fine specimens of typographical art. When salesmen first made the acquaintance of consumers of roofing they had little else to offer besides iron roofing and red oxide paint. To-day roofing salesmen offer a full line of metal roofing and specialties. In their catalogues will be found various styles of rolled roofing, iron and steel, prepared ready to lay, tools loaned for the purpose. A few specialties in standing seam roofing, V-crimped, corrugated, beaded and other kinds. Then will follow supplies, such as paints, nails, felt lining, ridge roll, ridge cap, &c. In ornamental designs there are painted sheets, pressed to imitate brick or weather board, also handsome designs for ceilings and galvanized sheets pressed to imitate rock face, steel shingles, plain and ornamental, and a variety of metal roofing in other designs. Other adjuncts to the roofing manufacturer's business are galvanized conductor pipe, eave trough, miters, cornices, finials, and, in fact, anything and everything in the shape of sheet metal goods required for finishing a building. Many of them have added galvanized and black sheets, flat, to their catalogues, also tin and terne plates.

As the early manufacturer has developed his lines of manufacture and general business methods so has he developed his machinery and arrangements for producing goods at the lowest possible cost. He loses no time at any stage. The best machinery obtainable is purchased and a large tonnage is produced for small labor expenditure. He advertises freely and well, and his sales men are so fully prepared that a good man has every opportunity to sell something or other in each town he visits.

There is probably no other business in which the consumer comes into such direct contact with the manufacturer. The proportion of iron and steel roofing handled by jobbers is very small. They handle very little of the $6,000,000 passed annually between consumers of iron and steel roofing and manufacturers.

The British Roofing Trade.—Corrugated iron was the first form in which iron sheets were applied to buildings for roofing purposes in large quantities—*i. e.*, it was the first staple commodity for the purpose listed in trade papers of Great Britain and its colonies. In its flat form sheet iron has been used for roofing purposes ever since its introduction. The trade of India, Australia, New Zealand and Canada has furnished orders of great value to the English Ironmasters for many years past and they continue to enjoy this trade, but their products have in the course of time assumed a different shape. At one time all orders from British India and the East were standard specifications. Merchants were unable to figure ahead in regard to special specifications for various purposes and nine-tenths of the orders were made up in sizes easy to handle and transport either by ocean, railroad or camel back. A very familiar size was 4 x 2 feet. This size served any and all purposes of British India, Burmah, Egypt, Northern and Southern Africa and any other part of the world under submission to England, where the English language was not spoken generally or civilization was kept down to the standard desired by British traders.

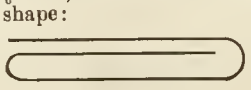
The uses to which this material was put do not come strictly within the business of iron roofing, but many of the gauges shipped were used for that purpose. An ordinary specification for export sent to an English rolling mill would read about as follows:

	Per bundle.	Approximate thickness.
4 x 2 feet by 112 pounds, 1 sheet	=	3-8 inch.
4 x 2 feet by 112 pounds, 2 sheets	=	3-16 inch.
4 x 2 feet by 112 pounds, 3 sheets	=	13 gauge.
4 x 2 feet by 112 pounds, 4 sheets	=	15 gauge.

and so on up to 14 sheets per bundle, the last named representing No. 26 gauge, which was the lightest gauge ordered.

Although transgressing somewhat beyond the purpose of this article, it is a means to an end—viz., to refer to foreign development in the iron and steel roofing industry parallel with American development. British colonies and dependencies have always accepted what traders offered no matter whether the sizes suited their requirements or not. American consumers are nearer to the source of supply and make demands for the class of material which conforms to their ideas of what should be furnished, hence the difference in development of the industry in England and America. The ritual of the British trader is that if a certain thing has pleased a buyer once it must please always, and he will not change his notion until he realizes that a trader from some other nation is getting the best of him. Britishers have a strong hold upon foreign trade for all classes of iron and steel products, and will not change their specifications except under great pressure. In Spanish, Spanish-American and Brazilian trade this is amply illustrated. To these countries the sizes of sheet iron are always made under the metric system: Two meters long by 1 meter wide is the regular size (6 feet 6¾ inches by 3 feet 3⅜ inches) and sheets of this size are cut up for any purpose for which they may be needed. The lightest gauge ordered is about 28 gauge, eight sheets to the bundle, 112 pounds.

The two kinds of specifications referred to are common orders for export trade. The lighter sheets are used for roofing purposes and the heavier for general purposes. In the first specification the bundles of light gauges are often doubled up so as to be transported on the backs of camels, and the heavy plate, such as 4 x 2 feet by ⅜ and $\frac{3}{16}$ inch, are bent hot into the following shape:



Ropes are passed through the folds to make secure on camels' backs, and the material is thus carried across the desert. The sheets which are used for roofing purposes are usually painted white after being applied.

Flat sheets for roofing purposes form but a small part of England's trade in this line. Corrugated sheets are staple in the markets of British exporters. Orders for black or painted are seldom heard of. Nearly all corrugated sheets shipped from Great Britain are galvanized. The trade is enormous. Everything is corrugated. Standing seam roofing is almost unknown. Steel or iron shingles (slates, as they are called in England) are occasionally heard about, but the bulk of the trade is galvanized sheets and almost the entire product is sent abroad, Australia, South America and India furnishing the best customers. For shipment the sheets are placed in felt lined crates, each containing about 1120 pounds (½ gross ton). The material is generally iron, not steel. Most of the galvanized sheets made in Great Britain are from muck bar piles with a top and bottom of wrought iron turnings or scrap worked on cinder bottom. The bars are rolled free from scale and the ame care is taken in rolling sheets. The English claim, and no doubt justly, that sheets made in this manner are better for galvanizing purposes than steel. It is a common error among Americans to judge galvanized sheets by the size of the spangle. If the spangles are large it is a sure indication of a smooth surface of steel or iron, as the case may be, but a sheet having smaller spangles may give longer service for the reason that the coating adheres more firmly. For some purposes the steel sheet with its brilliant spangles is preferable, but for outdoor work the iron sheet with its smaller spangles of greater adhesive quality is to be desired, always provided that the iron sheet is tough and pliable.

English Corrugating Machinery.—English manufacturers of corrugated sheets do not use rolls for the purpose. Presses are used exclusively. Fig. 1 illustrates a common design of corrugating press used in England and Scotland. In the matter of strength, judged from a weight of metal standpoint, it would outclass any two American machines in existence. Britishers never spare metal in a machine of any description. No matter for what purpose it is intended, its strength is judged first by its weight, whether properly distributed or not. This is a blunt assertion, but, nevertheless, true. Witness lathes, machinery, agricultural implements, or any other class of heavy tools exhibited by British makers at the World's Fair, or compare vehicles for pleasure or business. There is nearly always twice as much iron or wood used as in American manufactures used for similar purposes. The Britisher is always "afraid it will break." If the corrugating machine illustrated in Fig. 1 breaks with anything lighter than No. 12 gauge worked upon it the cause will be culpable negligence in its adjustment. The plunger A is solid cast iron; to this the upper die is attached. This die makes two corrugations of ordinary size. The lower die is fixed to the bed B, which is also made of cast iron. Contrary to the rule adopted in American machines, the driving shaft is at the bottom of the machine (note shaft C) and the motive power is placed at the side, bedded on the ground, instead of being attached to the machine above the heads and out of the way of operators. When changing from one thickness of sheet to

another the difference is adjusted by means of adjustable screws, D. When corrugating sheets as light as No. 28 gauge six are placed in the machine at one time. It must here be stated to the credit of Britishers that their standard gauge is nearer to No. 24 than No. 28, strictly products of American ingenuity with the exception of corrugated sheets. No ideas have been borrowed from any other country and no other country has developed the industry to such an extent. In fact, it is doubtful whether any other industry known to the world and still maintains its prestige as the largest producing center. Corrugated iron was made in Pittsburgh and the East 25 years ago, but only in small quantities. The importance of the iron and steel roofing business in America dates from that time. In 1868 the firm

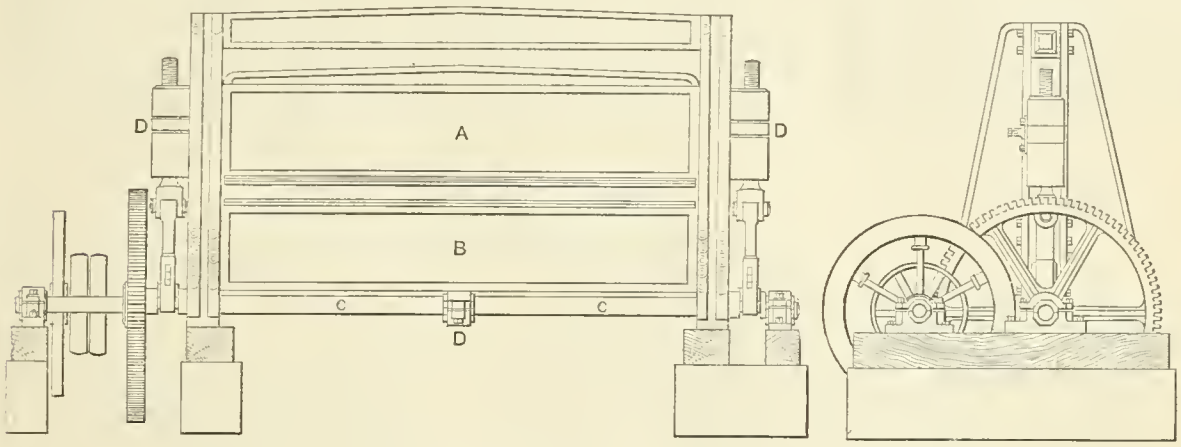


Fig. 1.—English Corrugating Press.—Length of Die, 10 Feet 3 Inches.

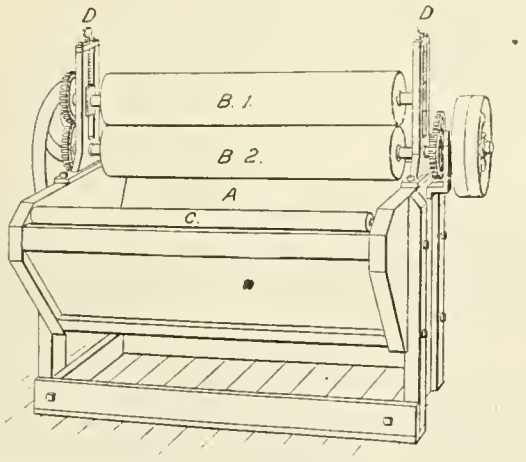

Fig. 2.—The Modern Painter.

of Caldwell & Co. was established in Cincinnati. They made rolled edge roofing by hand power. The design was known as "Outcalt" pattern and the machine used passed into the possession of the Cincinnati Corrugating Company after the death of Mr. Caldwell in 1883. The machine has since been destroyed, but the last named company continue to manufacture that style of roofing. Mr. Caldwell's death caused a dissolution of the firm, and the honor of being the oldest roofing concern now belongs to the Porter Iron Roofing & Corrugating Company. Immediately after Caldwell & Co. started in business W. S. Belt commenced operations. In 1876 Mr. Belt's business was sold to W. H. Porter, the present secretary of the Porter Iron Roofing & Corrugating Company. The Porters consequently have the oldest roofing

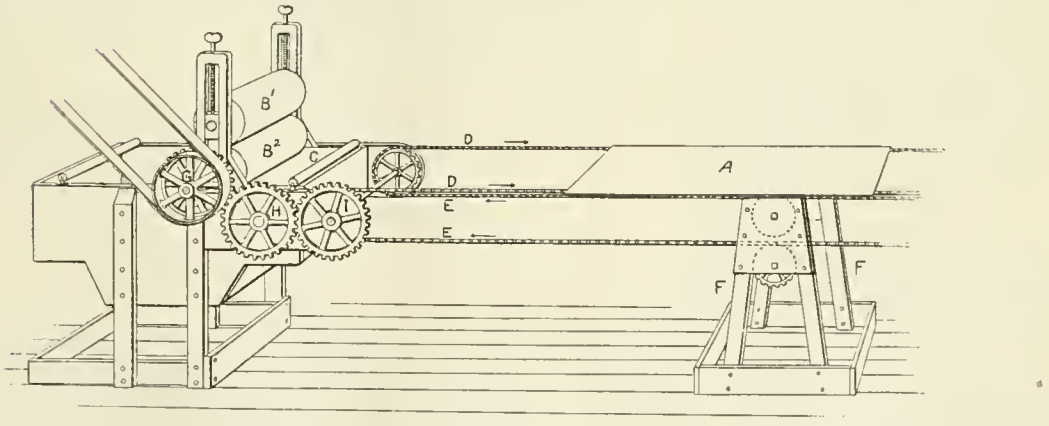

Fig. 3.—Sheet Carrier Attached to Painter.

THE DEVELOPMENT OF THE IRON AND STEEL ROOFING INDUSTRY.

and sheets as light as the latter gauge are the exception rather than the rule. The standard adopted recently by the National Iron Roofing Association is No. 28 painted sheets. The bulk of English orders are No. 26 galvanized.

The American Roofing Trade.—The variety of forms into which iron and steel roofing is made in this country are

was developed in such a degree in so short a space of time. The active history of the industry does not date back more than 15 years, although it struggled against prejudice 10 years prior to that time.

From the best information obtainable it is learned that Cincinnati, Ohio, was the first important seat of the industry

business of Cincinnati and are the original makers of V-crimped roofing in the United States. In 1873 Scott & Co. started an iron roofing manufactory in Cincinnati and the concern are still in existence. Other concerns still doing business at their old stand are: W. G. Hyndman & Co., established 1877, and the Globe Iron Roofing & Corrugating

Company, who commenced business about 1880. Several other concerns were formed between 1875 and 1880, but they are now out of existence. About 1878 the New York Iron Roofing Company moved to Cincinnati from Ironton, Ohio, and were afterward succeeded by the Sagendorph Company, now known as the American Roofing Company.

Among the most successful of Cincinnati roofing companies were the Cincinnati Corrugating Company, established about 1879. They were the first company to make a specialty of corrugated iron, and they did such an extensive business that they were compelled to move to more roomy quarters a few years ago. They selected Piqua, Ohio, for a site, and their entire business was moved to that point, where operations are continued in connection with the Piqua Rolling Mill Company, from whom their supplies of iron and steel sheets are drawn. The removal of this company withdrew a large tonnage from Cincinnati, but it is still the largest producing center. Other important seats of the industry are St. Louis, Chicago, Cleveland, Ohio; Niles, Ohio; Wheeling, W. Va., and Canton, Ohio. The roofing works of M. H. Chittenden & Son, Minneapolis, are the nearest to the Pacific Coast and Northwest.

The number of manufacturers engaged in the iron and steel roofing business has increased from 20 to 60 in 12 years, and the quantity of sheets used for the purpose from 20,000 to 100,000 tons.

American Machinery. — American manufacturers have made wonderful changes and improvements in sheet metal working machinery, not only in the roofing business, but all other branches. The number of manufacturers of iron and steel roofing has shown an increase during the past few years fully equal to the growth in the demand for such material, if not greater, and the older manufacturers, desiring to maintain their prestige, have adopted economical methods of production in order to distance new competitors. This competition, together with lower values of iron and steel sheets, has made iron and steel roofing cheaper year by year, and competition is no longer with the slater or shingle splitter. It is confined to the iron roofers themselves. The increased number of manufacturers engaged in the business, improved machinery and lower prices of iron and steel sheets have caused brisk competition, that has brought the cost of iron or steel roofing far below that of shingles or slate. The first important step taken by roofers was in the matter of painting sheets. At first all sheets were laid across trestles and painted by hand. Plenty of paint was used, but it was not evenly distributed. It was heavy and light, in patches, it dried slowly and was not satisfactory. Boys were usually engaged in the work and they generally managed to get as much paint upon their clothing and on the floor of the painting shop as they did upon the sheets.

when the old has worn thin, or the raising distance of the upper roll can be adjusted to sheets of varied thickness. To facilitate the operation rollers C are placed on either side of the paint tub. This first step toward improvement was important, but roofers still found it expensive to carry sheets from the painter to the drying racks. So much room is required for drying that buildings for the purpose vary from 100 to 600 feet in length. If the painter is located at the end of the building where black sheets and painting material are received, as it should be, it is expensive to carry

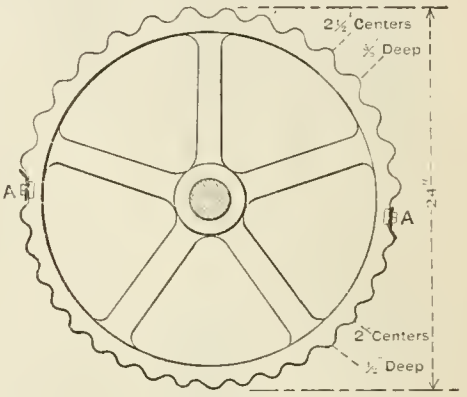

Fig. 5.—End View of Corrugating Roll, Showing Guides.

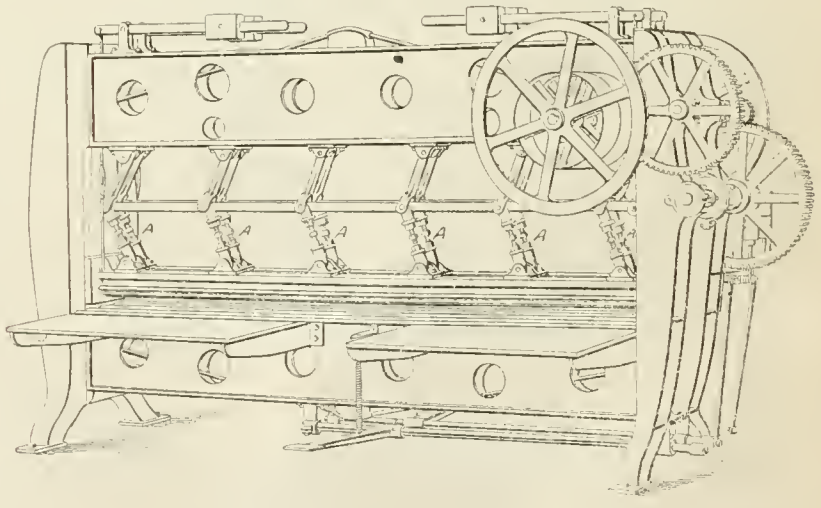

Fig. 6.—Corrugating and Forming Press.

THE DEVELOPMENT OF THE IRON AND STEEL ROOFING INDUSTRY.

The Modern Painter.—The modern painter here illustrated was designed by W. G. Hyndman, the veteran iron roofer of Cincinnati, Ohio. The method of operating is simple. Tub A, Fig. 2, is filled with paint. In feeding sheets to the painter, the end of the sheet is dexterously dipped by the operator into the paint so as to catch up the smallest quantity possible, and is then passed through rolls B1 and B2. These rolls are covered with canton flannel, which absorbs the paint and distributes a very even coat over the sheet. The lower roll B2 is fixed in a stationary journal, but the upper roll B1 is adjustable, turning in a movable journal box. By raising screws D room is allowed for a new covering of flannel sheets the full length of the building. To decrease this expense the chain carrier illustrated in Fig. 3 was devised. It is very simple in construction. A few supports are required, placed about 12 feet apart, a few hundred feet of link belt and some sprocket wheels. The motive power is derived from a cog wheel placed on shaft of roll B2. This cog wheel or pinion is placed inside pulley G, and operates cog wheel H, which in turn causes pinion I to rotate in the desired direction. This pinion is fixed upon an extension on the paint tub, the shaft is carried through to an extension on the opposite side of tub and two sprocket wheels for driving the link belt are placed on the same shaft on the inner side. Sup-

ports F carrry two shafts, each having two sprocket wheels fixed on the inner sides. The link belt travels from the painter over the top of the upper sprocket wheels and returns over the top of the lower wheels, as indicated by arrow marks E and D. The sheet of painted iron A has passed through rolls B1 and B2 over the roller C to the link belt, and is thus carried, as shown in illustration, the full length of the carrier, unless removed at an intermediate point to be placed in the drying racks. By this process one man can feed sheets to the painter as fast as six men can remove them from the carrier. The average capacity is 500 sheets per hour. Since the average weight of the sheets used is 12 pounds, the capacity is 60,000 pounds per ten hours. The men employed to carry sheets from the carrier to the drying racks stand on either side about 25 feet apart, so that each gets his sheet in rotation and there is no waiting.

Corrugating Rolls.—When corrugating rolls were first introduced they were made small in diameter and did not corrugate the sheets perfectly. This was due to the spring in the rolls, which were cast hollow. This caused a twist in the sheets, which prevented a perfect fit when placed together. A pair of rolls relegated to the scrap heap a short time ago were only 18 inches in diameter. Rolls now made are more than twice as large. The old style corrugating rolls were only made for one size of corrugation, and separate pairs of rolls were kept in stock for various sizes. Machines are now constructed so that several different sizes can be made by changing the shell of the rolls without taking the barrel from its position. The corrugating rolls illustrated in Fig 4 are known as double corrugating rolls, one-half of each roll being for one size of corrugation and the other half for another size, the division being at flat part A.

The sheets are fed to wrought iron guides, A A, in the accompanying sketch. These guides are set in the flat part of rolls, and are slotted so that they can be moved forward or backward as required, so as to make the first corrugation either full or half corrugation, as may be desired. This improvement insures accuracy in fit of sheets, as each side corrugation will be exactly alike, provided the sheets are sheared square.

Corrugating Presses.—Fig. 6 illustrates a modern style of corrugating and sheet metal forming press. It is a much lighter machine than the English corrugator illustrated in Fig. 1, but the strength is so evenly distributed to required parts that it is capable of corrugating or forming sheets as heavy as No. 16 gauge. In the English machine the plunger A is solid. When it descends it makes two corrugations, the draw in the sheet being allowed for by making the corrugation on the finishing side deeper than the corrugation on the near side. Each corrugation is finished in the groove on the finishing side. In the American machine the plungers A do not each descend at the same time. The plunger on the back side descends first and the draw in the sheet is taken up before the plunger on the front or feed side descends. The motive power of this press is attached to the cast iron side columns of the machine out of the way of the operators, instead of being on the floor, as shown in the English machine, Fig. 1. The American press can be used for forming a large variety of designs in sheet metal roofing and siding. The improvements referred to in this article do not by any means comprise all that have been made up to date, but are sufficient to illustrate the advanced stage of the industry compared with 15 years ago.

The Export Roofing Trade.—Production has been reduced to minimum cost, and a near approach to perfection attained in the quality of iron and steel roofing material. In its large variety something can be found suitable to any style of building, and the convenient shape in which it is packed makes it possible to ship to any part of the world. Up to the present time the quantity of iron and steel roofing material shipped from America to foreign countries has been very small and cuts no figure in the importance of the industry, but there is no reason why good connections should not be formed in this line of business with Central America, Brazil, the La Plata, and other valuable markets of South America. In Australia there is a wonderful field open. Iron buildings are as common there as frame buildings in America. They are made of galvanized iron usually, and are so constructed that they can be moved readily from one section of country to another. With the wonderful facilities that the United States possesses for wood and sheet metal working, there is a chance to supply Australia with cheap portable buildings constructed of wood and iron which is worth looking into. At present this trade is controlled by English manufacturers.

A NEW SLATE COMPANY has been formed at Stroudsburg, Pa., named the Blue Ridge Slate Company. George H. Rhodes of Stroudsburg is treasurer of the concern, which has leased a large quarry near Wind Gap and will begin operations immediately.

Nativities of the Iron Miners.

Some statistics published by the Ironwood, Mich., *News Tribune*, respecting the nativity of the unemployed in that town and its immediate vicinity, are interesting. There are in the county of Gogebic, in which Ironwood is situated, 5447 persons receiving aid. These persons are receiving charity because of the fact that the iron mines in the county, which formerly furnished employment to the heads of the families, are shut down and the miners are out of work. The Ironwood paper gives the following table of the number of persons, by nationalities, who are dependent upon charity:

	Wakefield.	Ironwood.	Bessemer.	Total.
Poles	43	268	315	626
Fins	168	448	126	742
Italians	60	92	102	254
Germans	..	260	109	369
Bohemians	..	209	74	283
Scandinavians	75	859	77	1,011
Irish	35	701	56	792
Hungarians	..	22	12	34
French	16	210	25	251
English	54	633	151	838
Slavs	..	27	..	27
Americans	5	44	14	63
Syrians	..	14	..	14
Austrians	..	79	12	91
Scotch	..	11	..	11
Hollanders	..	..	10	10
Welsh	8	..	..	8
Totals	486	3,878	1,083	5,447

There are but 63 native Americans in a total of more than 5000 persons who are either miners or of the families of miners.

All the commercial organizations of New York City are forwarding petitions to the Legislature asking for the deepening of the Erie Canal, in order to increase its traffic and correspondingly reduce the cost of freight carriage thereon. It is pointed out that under existing circumstances the rates charged by the canal carriers are more than three times as high as those paid on the great lakes, and are only a trifle less than the rates charged by the railroads paralleling the canal. By increasing the depth of water, in order to admit the navigation of heavier boats, it is claimed that these rates could be profitably lowered, and a large portion of the lake grain traffic which is at present diverted to the St. Lawrence route and ports other than New York would be passed to shipment through this State and city.

Ventilation in Canadian Factories.

In his annual report, recently issued, Dr. C. I. Samson, sanitary inspector for the Province of Quebec, Canada, makes some pointed remarks on the obstacles interposed by the workmen themselves to the introduction of any efficient system of ventilation in the factories and workshops of that section. He says: In this matter it is especially the workman's prejudices that we have to deal with. If we ask the latter what are the sanitary defects of the workshop where he is employed, ten to one he will answer, "there are drafts." This constitutes the great source of disease, in the minds of the workmen. Therefore, no sooner does one attempt to open a ventilator to renew the air in a room than 20 arms are raised to close it. With such notions, the working of any system of ventilation becomes a difficult problem to solve. I have seen suction pipes reaching above the roof which were stuffed with rags. At another place a ventilating apparatus was put up at the suggestion of my predecessor so as to draw off contaminated air from the center of a large room; all the pipes are still set up, but great care has been taken to cut off their communication with outside for fear of drafts. The workman does not sufficiently appreciate the sanitary physician's part in industry, and this hinders the efficiency of the service. That notions of hygiene should be diffused among the people is a problem to be solved.

Of a large number of young men who qualified to enter the Manual Training School at Camden, N. J., but 25 could be admitted, owing to the lack of accommodation for a greater number.

It is announced that the Bell Telephone Company will ask for an increase of their capital stock by $20,000,000 or $30,000,000, in order to meet the enormous growth and development of its business. The present capital of the company is $20,000,000.

The Transvaal gold mines produced 1,478,473 ounces of gold in 1893, as compared with 1,210,862 ounces in 1892 and 728,613 ounces in 1891. It looks as though the gold product for 1894 will reach $35,000,000.

Joseph Richards of Philadelphia has a plan for soldering aluminum which involves the use of phosphorized alloys for the purpose, the function of the phosphorus being to remove the thin film of oxide always present on the surface of aluminum and which renders soldering so very difficult. Good practical results have been attained.

PLUMBING and GAS FITTING.

Domestic Electrical Work.*—X.

By W. A. W.

Electric Gas Lighting.

Fig. 19 shows a reliable and inexpensive arrangement to give an alarm when the circuit for any reason remains closed, or grounded, as it is popularly termed. A soft iron armature is pivoted to one end of the spark coil, as shown at A, and one wire of the alarm circuit

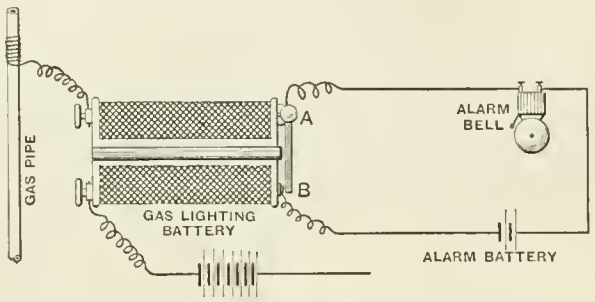

Fig. 19.—*Device to Indicate when a Gas Lighting Circuit is Grounded.*

connected with it; the other wire is connected at B. When for any reason the gas lighting circuit is closed the core of the spark coil attracts the armature and closes the alarm circuit at B. The act of lighting a burner is of such short duration that the bell will scarcely sound, but should the circuit remain closed for a longer period the bell will ring loudly, plainly indicating that something in wrong, so that the battery may be disconnected and saved while the trouble is being remedied.

It is also a very good plan where a large number of burners are used in a house to divide them into small groups and run a separate battery wire to the cellar from each group and there connect them to switches. This will be found a very convenient arrangement and costs but a trifle more. When a ground occurs with a system arranged in this manner it is only necessary to open the switches in succession until the one connected with the grounded group is reached. This should then be left open and the fault traced, while the rest of the lighting system is left undisturbed and in full working order.

The wiring for electric gas lighting is usually done when the pipe fitting is completed. The ends of the wires are wrapped around the nipples which project through the plastering and are left this way until the fixtures are fitted and tested. In the case of side bracket lights, which seldom have a separate shell from the gas pipe, the fixture wire should be run on the under side of the bracket and securely tied at short intervals with linen thread. Two or three coats of shellac varnish should be applied to the fixture and wire. When dry the threads should be removed, leaving the wire firmly glued to the fixture. At the swing joints the wire should be formed into a small spiral coil of sufficient length to permit the fixture to swing either way to its fullest extent without drawing the wire tight. The fixture wire referred to is a No. 22 or 24 triple covered wire made in a variety of colors to match the gas fixture. The connection of this wire with the battery wire should be behind the collar which goes next to wall or ceiling.

In the case of chandeliers, which are incased in fancy shells outside of the gas pipe, we are confronted with the most exacting part of fixture wiring. It is true we can in many instances run the wire from collar to burner entirely between the pipe and shell, and while this is very desirable and necessary to a neat job, it at the same time affords the chief danger of grounding. In running the fixture wire as just described we must encounter the obstructions shown in Fig. 20 at A. These are very dangerous points, for the shell, being very thin, readily cuts the insulation, and the liability of the different parts of the shell being accidently or otherwise turned seriously increases the danger. It will, therefore, be readily seen that the greatest caution should be exercised in wiring fixtures, and enough of the shell should be cut away at the points indicated at A in Fig. 20 to permit the wire to be well covered with rubber tape. In nine cases out of ten where a ground occurs it will be found in the fixture at some such point. But one wire is run down the chandelier pipe from the ceiling, the branches leading to the various burners being spliced on in the hollow globe like shell surrounding the gas pipe where it branches, as shown in Fig. 20 at B.

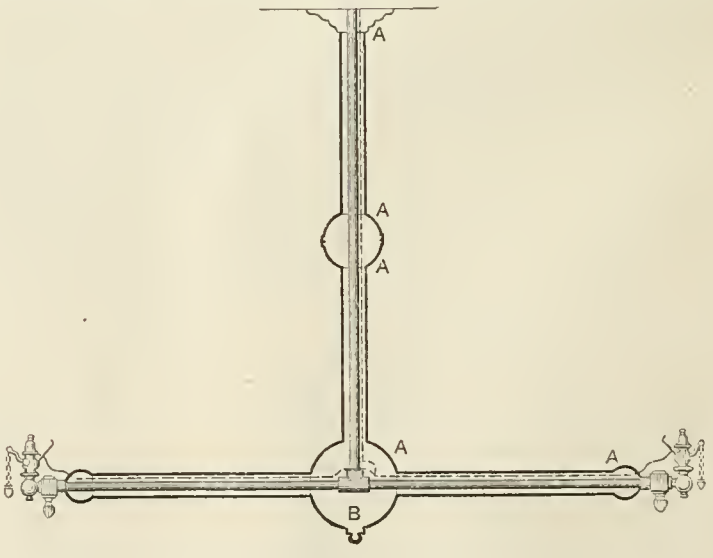

Fig. 20.—*Gas Fixture Wired Inside of Shell.*

Multiple Gas Lighting.

Among the most useful applications of electricity is the instantaneous lighting of large numbers of gas jets in theaters, churches, &c., better known as the multiple system. The central apparatus consists of an induction coil with condenser, key, circuit breaker, battery and circuit switch. The burner consists of a lava standard and tip provided with platinum pointed poles placed in such manner that the spark must jump through the gas. These burners are connected in groups, sometimes as many as 40 or 50 burners being connected in a single group. All the burners of a group are connected in series—that is, the wire runs direct from one pole of one burner to one pole of the next burner, and so on. Plain copper wire, without insulation, is usually used on the fixtures. The gauge is from No. 24 to 27, only one wire being used for each circuit, the gas pipe forming the return the same as explained for pendant and automatic lighting, with this difference—that the wiring should nowhere if possible touch anything but the insulators in its course and should not be brought closer to the gas pipe than 1¼ inches. If, however, it becomes necessary to run close to the pipe the wire should be incased in rubber or glass tubing. If for any reason it should be necessary to run the main wire in contact with wood or stone work a special rubber compound covered wire should be used, but no

*Copyrighted 1893, by David Williams.

metallic staples must be used to hold it. When we consider that the resistance of a single burner is greater than 100 miles of fine wire would be, we can readily conceive the high electromotive force required and the extreme caution necessary to keep it within bounds. The last burner of each group must be connected with the gas pipe to form the return wire. The gas piping should, of course, be arranged in the same way the lighting circuits are, and each group should have a stop cock located close to the central lighting apparatus. All the local cocks on the burners being left open, when the gas is turned on and the switch set for the group to be lighted a stroke of the key sends the electric spark flashing from burner to burner, igniting the whole group in an instant.

Open circuit batteries may be used with this apparatus. There is, however, a device on the market known as the electric frictional machine, which dispenses with the battery and induction coil. As, however, this class of work is somewhat technical, and the central apparatus must be adapted to the requirements of the individual case, it is much better to furnish the manufacturers of supplies with a full description of the job in hand and get apparatus exactly suited to the case, as well as full instructions for its installation.

[THE END]

Ohio Master Plumbers.

The Master Plumber' Association of Toledo, Ohio, have perfected arrangements for the State meeting, which will be held in Memorial Hall, Toledo, February 13–14. The committees on convention work are: Hall Committee—Perry W. Waite, Theodore L. Meissner and Thomas Manion. Entertainment Committee—Robert Raitz, James W. Gould and Wm. G. Wacker. Finance Committee—Frank J. Kern, George J. Jackson and James Walsh.

Following is the list of present officers of the State Association: President, T. L. Poplowsky, Cleveland; vice-president, Robert Raitz, Toledo; corresponding secretary, C. C. Dewstowe, Cleveland; financial secretary, L. E. Huddleson, Columbus; treasurer, Wm. Hally, Columbus. John A. Waite of Toledo, D. N. Kelly of Columbus and H. M. Stowe of Marion, with the above mentioned officers, compose the State Executive Committee.

Connecticut Master Plumbers.

Thursday, February 15, the fourth annual convention of the Connecticut Association of Master Plumbers will be held at Putnam Phalanx Armory, Hartford. Active preparations for the meeting are now being made by President S. E Dibble of New Haven and his associates, and the banquet and local arrangements are in the hands of a committee.

Besides the regular business to come before the convention, essays on interesting subjects are promised by Robert Morgan of New Haven, Zalmon Goodsell of Bridgeport, Edward Mahl of Hartford, A. Troland of Norwich, J. G. Shearlock of New Haven and others.

The present officers of the association are as follows: President, S. E. Dibble of New Haven; first vice-president, James Ahern of Hartford; second vice-president, J. B. Weiant of New Britain; recording and corresponding secretary, A. J. Clerkin of New Haven; financial secretary, R. H. Stothart of Middletown; treasurer, C. S. Eames of Bridgeport. These, with ex-President L. H. Mills of Bridgeport, constitute the Executive Committee.

Chicago Plumbers' Reception.

The Chicago Master Plumbers' Association held a reception and entertainment in the Auditorium in that city on the evening of the 5th inst. The attendance was very large, comprising not only the members of the association and their ladies but numerous representatives of the plumbers' supply houses and visiting plumbers from neighboring cities. Every care was taken to contribute to the convenience and enjoyment of the participants. In fact, for that evening, the plumbers seemed to own the hotel, having secured a large number of rooms for the use of ladies, others for gentlemen's wraps, and some for smoking and quiet conversation, while the main exercises were conducted in the famous banquet hall of the hotel, magnificently endowed by the richness of its architecture and superb effects in electric lighting for such a brilliant gathering.

The programme of the evening was a *melange* of an exceedingly attractive character, adapted to suit the varied tastes of the assemblage. An able address of welcome was delivered by Paul Redieske, president of the association, after which the retiring president, T. P. Culloton, was called forward to receive a handsome gold badge presented to him as a token of the esteem with which he was regarded by the members of the association. Albert E. Hyde, salesman for James E. Clow & Son of Chicago, then most effectively delivered a recitation entitled "The Darky's Prayer." Next came a grand march and quadrille, with which dancing was inaugurated. A feature of this portion of the programme was the presentation to each lady of a beautiful souvenir of the occasion, consisting of a leaflet of suitable poetic quotations, bound in a rich cover of heavy boards, decorated with forget-me-nots. Dr. A. R. Reynolds, Chicago Commissioner of Health, then delivered an address eulogistic of Chicago and Chicago plumbers. From that time until long after midnight dancing was interspersed with recitations, songs and instrumental music of a high order. An elaborate supper was not the least enjoyable part of the programme. The success of the entertainment reflected much credit on the committees, which were constituted as follows:

Arrangement Committee: Paul Redieske, Thos. Conway, Alex. W. Murray, P. Sanders, G. A. Larson, T. P. Culloton, P. M. Murphy, J. B. Breen, C. C. Breyer. Reception Committee: Robert Griffith, D. J. Rock, David Whiteford, A. Joung, E. Baggot, T. C. Boyd, J. R. Alcock, J. G. Weber, Alex. Irona, C. J. Boyd, J. H. Roche. Floor Committee: Thos. Conway, Jas. H. De Viney, W. H. Cummins, J. A. Voltz, A. C. Hickey, C. J. Herbert, P. J. Morrisey, Wm. Gay, J. J. Doyle, J. G. Roland, Wm. T. Geary, R. Finn.

TRAPS AND VENTS.

THE MASTER PLUMBERS' ASSOCIATION of Holyoke, Mass , have appointed T. J. Carmody, C. P. Lyman, C. H. Tower and C. C. Kelly as a committee to arrange for the annual meeting of the State Association in May.

ON THE 6th inst. the Master Plumbers' Association of Iowa, in session at Des Moines, formulated a bill to be presented to the Legislature providing for the appointment of a State board of examiners under control of the State Board of Health to examine plumbers and issue licenses to graduates or skilled workers who can pass examination. Over 100 plumbers were in attendance at the convention, a number of whom were from Chicago.

A NEW PLUMBING SHOP has been opened by Eldreth Arnold, at 38 Miller street, Auburn, Maine.

THE BANGOR, MAINE, PLUMBERS recently held a meeting to talk over various matters regarding a permanent organization. At a meeting to be held Tuesday, February 13, the organization will be completed and the officers elected. J. W. Chamberlain is temporary president.

THE MASTER PLUMBERS' ASSOCIATION, Worcester, Mass., held their annual meeting at the Builders' Exchange, Tuesday, February 6. There were 18 present, President J. W. Jordan in the chair. The reports for the year were read, and the retiring officers made speeches. The following officers for 1894 were elected: President, James C. Luby; first vice-president, William F. Tucker; second vice-president, John F. Deedy, secretary, A. A. McLaughlin; treasurer, O. S. Kendall; secretary's clerk, C. C. Brown.

AT THE LAST REGULAR MEETING of the Examining and Supervising Board of Plumbers and Plumbing of Rochester, N. Y., the following officers were elected for the ensuing year: George H. Caffery, president; J. Alfred O'Kane, secretary.

WOMBOLD BROS. have opened up a gas and steam fitting shop at the corner of Hendricks and Fourteenth streets, Anderson, Ind.

SEYMOUR J. WILLIAMS of Petersham, Mass., has bought a plumbing shop and stove store in Greenfield.

J. W. CHAMBERLAIN & Co., plumbers and steam fitters, have removed to their new quarters in the Columbia Building, Bangor, Maine.

GEORGE AMES has moved his plumbing shop from South Quincy to the basement of the Court Room Building, Quincy, Mass.

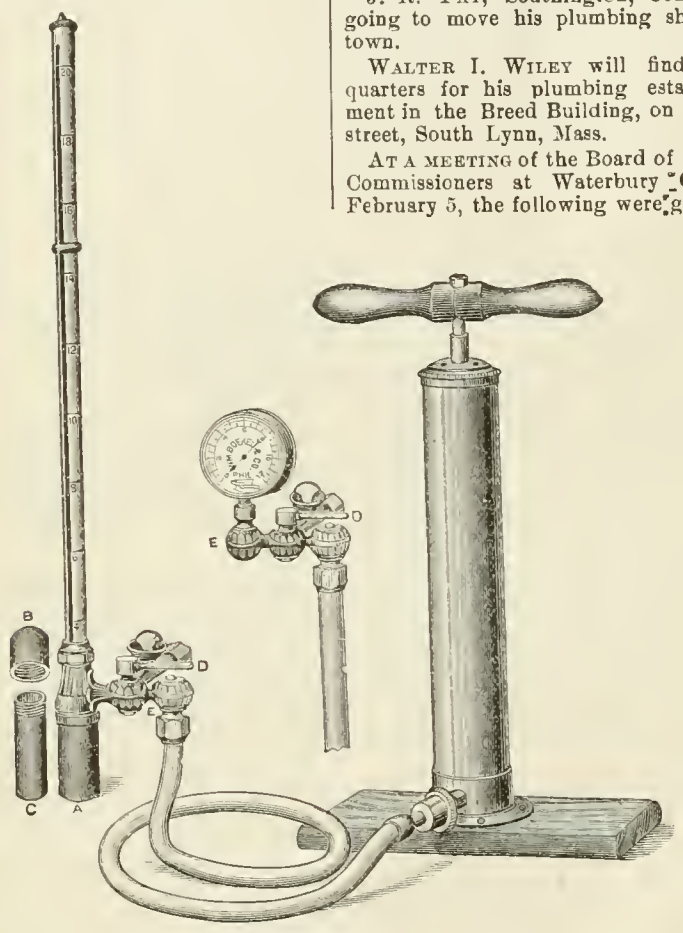
D. W. SPERRY has purchased a half interest in the plumbing business of Clefton Bros., Owatonna, Minn. The name of the new firm is Clefton Bros. & Sperry.

AT THE LAST SESSION of the Council of Jersey City, N. J., plumbers' licenses were granted to A. B. Dickinson, John Mitchell, George Mitchell, John J. Keilt and John P. Langan to make connection with the water mains of Jersey City and also to do general plumbing work when they file the required bond in the office of the Permit Clerk.

THE WORCESTER, MASS., BOARD OF EXAMINERS OF PLUMBERS, consisting of Charles H. Peck, Dr. L. F. Woodward and John F. McCartney met recently and opened the papers of the six persons who applied for licenses to engage in the plumbing business, and who took the examination before the board held Friday, January 26. The examination consisted of 25 questions pertaining to almost every detail connected with sanitary and practical plumbing. Another test was the dissection of a chart containing all the defects that are to be found in ordinary, every-day plumbing work. The examiners have reported to

the Board of Health that the following men have proved their proficiency and are eligible for licenses: Martin Delaney, 2 Mason street; Willard A. Parker. Nashua, N. H.; Davis Krischer, 24 Water street; E. D. Sisson, 205 Main street.

Secretary Geo. W. Leete of the Examining Board of Plumbers of Brooklyn, N. Y., recently appeared at the Gates Avenue Police Court against a master plumber who was accused of following his trade without the necessary sanction of the Examining Board. A fine of $10 was inflicted and the plumber went on record as the first man convicted in Brooklyn under the new State law. Secretary Leete also took out warrants for several other plumbers, and the board proposes to secure warrants for every man in the city of Brooklyn who, as far as can be ascertained, is pursuing the trade of a plumber without the necessary permission.



Improved Gas Fitters' Test Pump.

Fred Bowers has bought the Worster Building, between Sixth and Seventh avenues, Emporia, Kan., and has moved his plumbing establishment into it.

The annual meeting of the Master Plumbers' Association of Rochester, N. Y., was held February 2, and the following officers chosen for the ensuing year: President, William G. Reid; vice-president, James Tanner; financial secretary, William Wiedman; corresponding secretary, Frank Rosney; recording secretary, James Barr; treasurer, James O'Conner; sergeant-at-arms, John Walsh; Board of Directors, John Creelman, John Walsh, James Barr, James Tanner, George Foster; delegates to State convention at Buffalo, N. Y., March 6, James Maher, John Creelman and William Wiedman.

Chas. Franke will open a plumbing shop in Bellaire, Ohio.

B. P. Bower & Co., Cleveland, Ohio, issue a circular illustrating the Bower sewer gas trap, which they manufacture. They also embody a notice to the effect that they control United States patent No. 327,126, and that they will prosecute infringers.

Turner & Dayton, plumbers and gas fitters, have opened a store on West Sunset avenue, Asbury Park, N. J.

Frank M. Palmatier, Cobleskill, N. Y., has rented a building in the rear of the new bank, and will locate his plumbing shop there after April 1.

J. R. Fay, Southington, Conn., is going to move his plumbing shop up town.

Walter I. Wiley will find new quarters for his plumbing establishment in the Breed Building, on South street, South Lynn, Mass.

At a meeting of the Board of Water Commissioners at Waterbury, Conn., February 5, the following were granted plumbers' licenses: Disley & Weyand, Michael Clancy, the H. W. Keeler Company, the Charles Thatcher Company, M. J. Daly, L. H. Toucey, W. E. Booth.

The Smith & Anthony Company, 48–54 Union street, Boston, Mass., are issuing catalogue "B" of Sanitas plumbing appliances and other specialties, which supersedes all other price-lists. The catalogue has a handsome cover, and is a fine piece of printing on enameled paper, showing the cuts to the best advantage. In turning over its 64 pages it is noticed that a sectional cut of the Sanitas Royal water closet is used for the first time, to show its construction and connections. This is followed by the various styles of the closets and the Sanitas Royal square top embossed closet. The Sanitas Crown is a new closet, known as the No. 3, made to meet the demand for something lower in price. The Sanitas Royal is the latest addition to their line of baths, and is a roll rim porcelain enameled iron Roman bath, decorated with gilt bands and provided with the newest appliances. The Sanitas oval valve basin is a novel departure in basin construction, a gate valve opening and closing the outlet at the side, leaving the bottom of the basin smooth. These are followed by the Sanitas lavatories, sinks, traps and plumbers' specialties in brass and iron. The S. & A. pipe band for tapping cement lined pipe is another novelty. The Marshall automatic hot soda and hot water apparatus for gas fuel is designed for use where a continuous supply of hot water is not needed. This is a new apparatus and said to deliver water at any desired temperature from 130° up to boiling temperature. The last page shows a view of their iron foundries and machine shops and brass foundries and finishing works at Wakefield, Mass. The company have finely arranged showrooms at 54 Beekman street, New York, and at 217 Lake street, Chicago.

McMann & Taylor, 42 Cliff street, New York, are closing their first year in business by issuing a cloth bound catalogue of 200 pages devoted to goods used by the steam and hot water and plumbing trades. They state that this catalogue is a selection of the leading and staple goods and that it is to be followed by a larger and more complete catalogue as soon as it can be prepared. Prices and information are given of pipe, cast and malleable fittings, recessed drainage fittings, pipe hangers, valves of all kinds, steam and pressure gauges and regulators, suction, force and pressure pumps, pipe cutting and threading tools and machinery, pipe tools and vises, engineers' and firemens' tools, plumbers' brass goods, lead pipe and traps and cast soil pipes. At the back of the book is an excellent index.

Thos. C. Casey has been elected secretary and treasurer of the McCambridge Company, Limited, Philadelphia. Mr. Casey is a son of the late secretary and treasurer, whose death we recorded last week.

Improved Gas Fitters' Test Pump.

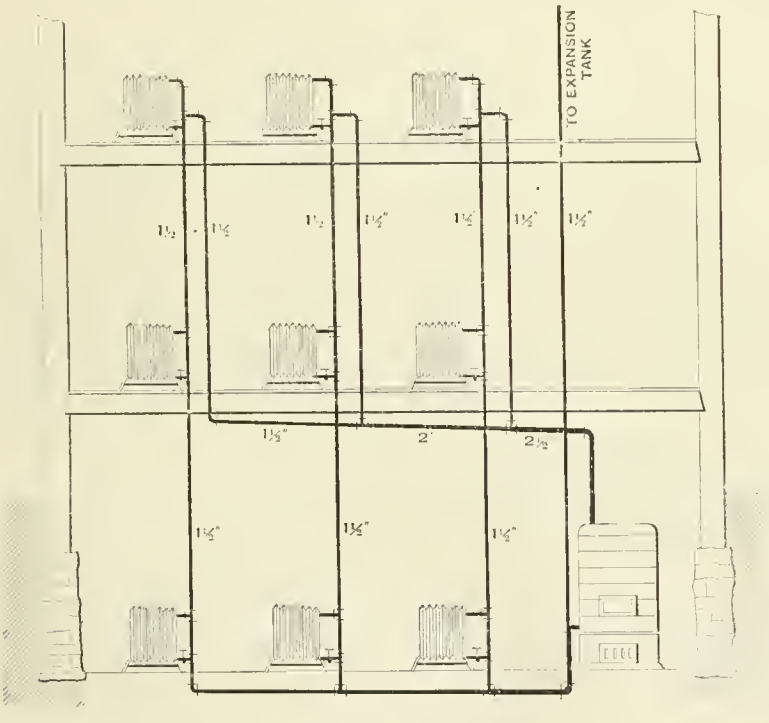
The accompanying illustration is of a gas fitter's test pump which Wm. Boekel & Co. of Philadelphia are putting on the market. The pump is combined with an improved mercury and spring test gauge. The mercury test gauge consists of a mercury cup, ether cup, stop cock and mercury column. A shows the mercury cup made of iron and threaded so as to screw into the lower part of the gauge. When not in use the cup may be unscrewed and closed with the screw cap B, to prevent loss of mercury. C is a piece of gas pipe for attachment to the gauge after the mercury cup is taken off for protection to the projecting glass tube. D is a stop cock to shut off the air. E shows the pump in combination with the spring test gauges. The pump is strongly made of brass with metal valves.

The advantages claimed for this pump are that all the brass work in the mercury gauge is above the mercury, thus obviating the possibility of damage to the brass work through spilling of the mercury. The mercury cup is readily unscrewed, closed with the cap and deposited in a tool bag, dispensing with the old method of removing the cup from the chamber, pouring the mercury into a ladle and carrying it in a pocket. The column is conveniently graduated, and the dial of the gauge is 2½ inches in diameter. The makers have applied for a patent on the article.

STEAM AND HOT WATER.

Piping a Hot Water Job.

From P. C. & C., *St John, N. B.*— If "R. E. M.," in *The Metal Worker* of January 20, will adopt the following plan he will have no difficulty in circulation. Instead of running separate risers for each radiator he should run 1½-inch pipe to second floor, say 10 inches above the floor. Make a return with a 1½-inch elbow and nipple into branch of 1½ x 1 x 1½ inch tee. Extend 1-inch pipe from tee to top of upper radiator, making ample provision for air tap, or extend small pipe above tank. Connect return of radiator with return at floor and drop 1½ inch pipe to ground floor, having two tees in



Piping a Hot Water Job.

first floor for top and bottom connections of radiators. At ground floor make similar connections, having the pipe drop some distance below radiator before running under floor or along base. Reduce main to 2 inches, as suggested, and run a similar 1½ inch pipe as above described for second tier of radiators; then reduce the main to 1½ inches and carry it along to line of third tier and run it directly to second floor and return it as with other riser. These three return pipes may be returned independently to boiler or branched into a large return main, corresponding with the flow main. To control ground floor radiators it may be found best to put valves in the return connection. We fitted a large building on this system with variation as the case required, and it works perfectly. You will observe this dispenses with much piping. You have positive circulation, and each radiator can be shut off without interference with the others, while all air is taken off at the top. Expansion tank should be connected direct to bottom of boiler.

From G. W. M., *Waynesboro, Pa.*— In answer to "R. E. M," in *The Metal Worker* of January 20, I would say that if he will put his expansion tank on top of the return pipe from the farthest radiator on the highest floor, and run the flow to low radiators direct from top of boiler, falling toward the farthest radiator, and carry return from low radiator to opposite side of boiler, putting an air valve on each radiator, he will have a fine working system. To locate expansion tank as shown would defeat the entire plan, as the hot water rising would take the course offering the least resistance and go overboard before the proper temperature could be reached in any of the radiators. I have paid for my experience in the way of time and labor, and a little knowledge of the first principles of circulation would dictate the above construction.

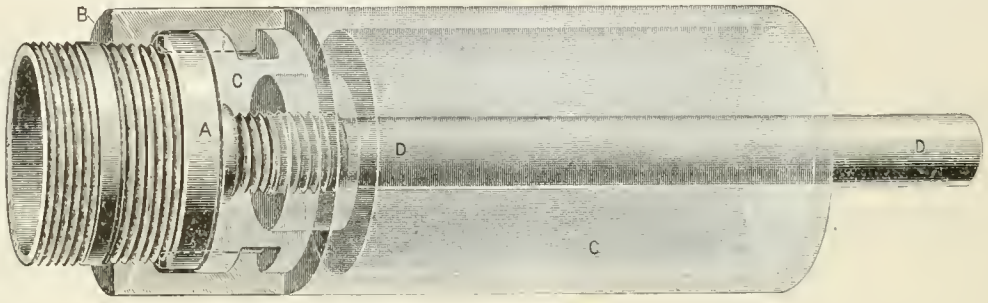
Questions About Boilers.

From STEAM FITTER, *Lowell, Mass.*— Will *The Metal Worker* please give me information on the following subjects? When a boiler carries 30 pounds of steam has the top or bottom the most pressure? What is meant by high and low pressure, and when does low pressure become high pressure? How often should a fusible safety plug be renewed, and what melting or fusing point is considered good practice? Is it good practice to place a check valve on return pipe of a heating job? What is the highest pressure you can carry on a boiler and return water to it? Give the best and most simple rule for estimating horse-power and grate surface required in a boiler and the size of chimney that should be used with it. How can you get the power of an engine? In setting a boiler should there be an air space in the brick work? What is the first thing to do with a heavy fire on and no water in the glass or gauges?

Answer.—The bottom of the boiler will receive the greatest pressure because it sustains the weight of the water as well as the pressure of the steam. A steam pressure of 15 pounds or above is generally considered high pressure. Low pressure boilers seldom use more than 10 pounds pressure. A fusible plug should be renewed when it has become so coated with sediment that it is not immediately affected by the temperature. As Banca tin is recommended for the purpose by some authorities, it should melt at about 400°, though alloys are used to make it melt at a lower temperature. The use of a check valve on the return is quite general with high pressure work. Its use in low pressure work depends on the opinion of the engineer installing the plant. Water can be returned to the boiler by the use of a return steam trap at any pressure which the apparatus is strong enough to carry. Authorities vary in computing horse-power, allowing, according to the construction of the boiler, from 6 to 20 feet of boiler surface to a horse-power, an average commonly used being 16 feet, and a grate surface of 1 square foot for from 4 to 8 feet of boiler surface. Rules for determining the size of chimney must be applied with so much judgment and are so cumbersome in calculation that experience is sought in preference by some authorities. Boilers which set so that the outer wall of a building forms one of its walls should have an air space in its brick work, otherwise the ground on the outside of the wall will absorb a considerable amount of heat from the boiler. When the water is low, with a heavy fire on, the best thing to do is to extinguish the fire by covering with ashes, or in the absence of ashes with fresh fuel, and shut off the draft, as the delay caused in drawing it and the increased heat during the operation might prove disastrous. In calculating the horse-power of an engine, multiply the mean pressure in the cylinder by the area of the cylinder and the speed of the piston in feet per minute, and divide the result by 33,000.

New Nipple Holder.

Curtia & Curtis, Bridgeport, Conn., have just placed on the market a new nipple holder, shown in the accompanying illustrations. The special object sought in this device is to make a holder that would be cheap, of small diameter so that it could be used in a pipe machine and at the same time be capable of taking a large range of sizes and not require the use of a hammer or other tool. Fig. 1 is a transparent view showing the working of the holder, while Fig. 2 shows one of the sockets which is a part of the holder, these sockets being made in different sizes to fit the various sizes of nipples. To operate the holder the socket B, Fig. 1, of the proper size of pipe to be cut is screwed to the body C by a one-eighth turn and the screw D is run forward by a wheel provided for the purpose. The nipple is then secured as shown in the cut, but is so arranged that it bottoms on the plunger A before it jams in the thread and is thus held securely. To release the nipple, a part revolution of the screw D will allow it to be removed by the fingers. These holders can either be used in a vise with a common die stock or with any of the pipe machines now on the market. The firm also mention that they can be used with their Forbes patent die stock. To meet



New Nipple Holder.—Fig. 1.—Transparent View of Holder.

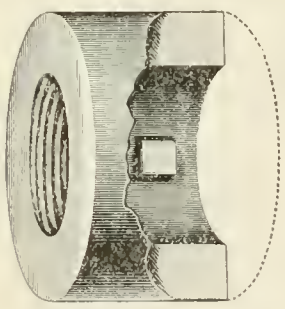


Fig. 2.—Broken View of Socket.

the requirements of the common style of overhung spindle machines, Curtis & Curtis have adapted this same principle to a holder intended for their use. Either right or left threads can be made with equal ease, and at a very slight expense sockets for any unusual size thread required can be provided. They are now made in various sizes up to a capacity for 6-inch pipe, but they can be made to any required size.

Steam Heating Queries.

From L. T. W., *Rockport, Mass.*—Would you please give me information in *The Metal Worker* about steam heating? In apportioning the radiating surface for a steam heating job in lower rooms is it calculated by the same method when the radiators or coils are suspended from the ceiling as when the radiators are placed upon the floor? Can a steam trap for returning condensed steam to the boiler be used with an apparatus carrying from 2 to 5 pounds pressure when the radiators are on a level with the boiler? Are steel traps used on low pressure boilers, or only on high pressure boilers?

Answer.—The same rules are used for apportioning the amount of surface required whether the coils are placed at the ceiling or at the floor. A return or lift steam trap will not work successfully on so low a pressure as is mentioned, although, when everything is working properly and the water does not have to be raised more than it would from a radiator set on a level with the boiler of the ordinary house heating pattern, it is possible for the water to be returned at so low a pressure as 5 pounds. In general practice no attempt is made to return the water at a less pressure than 10 pounds or above. Such traps are generally used in connection with high pressure heating jobs, and their use with low pressure work is exceptional.

Radiator on Boiler Level.

From J. W. H., *Montreal, Can.*—Writing from the city that I think, with truth, can be said to be the home of modern hot water heating as applied to domestic use, anything on the subject from those at a distance is of great interest. I note the communication of A. E. Edgar, in *The Metal Worker* of January 27, on what was at one time (some years ago) a very live question, viz, returning the circulation from radiators at or below the level of the returns on the boiler. Such a system of connections as shown in the cut presented with his letter would not be considered good practice here, as it mixes up on the one line of flow pipes radiators fitted on three different stories. In mild weather, when small fires are desirable and it is wished to have the radiators circulating with water at a very low temperature, the radiators on the top flat would rob the lower level radiators, and if compelled to pass through the lowest radiator, by closing valve B on the by pass it would be of such a low temperature as to be of little service as a heating medium. Again, as compared with a simple syphon direct from boiler, it is a complication requiring care in the proper manipulation of valves, and unless the length between points A A was considerable it would not be a great while before some of the joints in the vicinity of top radiator would be apt to develop serious leaks, if the fitting were not broken entirely by the expansion. This sort of trouble has frequently occurred when the cause was not nearly so great as a connection made as shown by your correspondent. Specifications here for good work invariably read that each flat must have a separate and independent main, not in any way connected with any flat on a different level, running direct from boiler.

While no rule can be made to cover all cases, the general principles controlling hot water circulation are fixed and unalterable, and one of them is that given a radiator, or set of radiators, on a high level connected to a main supplying radiators on a lower level, they will rob the radiators on the lower level when mild firing is required. That is, they will take all, or nearly all, the heat there is, letting the lower level radiators remain cold or nearly so. When each set of radiators on the different floors are supplied directly from the boiler, they will each get their proper share. I hope I have said enough to promote interest in the question and call for further discussion, as it is only by rubbing our wits one against the other that they are sharpened.

Indirect Car Heating.

From a foreign exchange the following is taken: A new system for heating and ventilating trains is being tried on the North British Railway, which, according to report, promises to give good results. Each vehicle is fitted with a pipe or air shaft which passes under the under frame, and from thence up through the roof of the vehicle. Both ends of these pipes are provided with hoods, which can be turned so as to catch the air. A steam pipe from the engine, supplied by the exhaust from the Westinghouse brake, passes along the whole length of the train and enters the air shafts, and thus the stream of air forced through the air shaft by the motion of the train is warmed before it passes into the compartments by means of the branch pipes. Owing to the air in the carriage constantly being changed an efficient system of ventilation is provided. The apparatus has also been tried on the Caledonian Railway and favorable reports have been received.

HEATING NOTES.

In our Trade Report this week will be found an item of more than usual interest to the steam and hot water heating trades. It is the new price-list of radiators just put out by the American Radiator Company. The full list is printed so that comparisons

can be made with the prices previously ruling and the reductions noted.

James P. Marsh & Co., 224 and 226 Washington street, Chicago, have issued a new catalogue descriptive of their air valves and pressure gauges. The catalogue comprises 16 pages and treats of Marsh's Acme automatic air valves, altitude gauges, steam and ammonia gauges, &c. The low pressure air valves cover a variety of sizes for air, steam and water, shutting off steam and water automatically. The No. 6 is designed for direct radiators, shuts off steam by expansion and water by flotation, and is made to circulate the condensed steam or water. This is accomplished by a divided passageway, so that the condensation is syphoned back into the radiator. The No. 3A has a large evaporating cup or air moistener, to take care of the condensation that sometimes escapes the valve seat. The improved No. 2 valve does away with the running joint from valve to drip pipe heretofore used and is specially adapted to the vacuum system. Other styles made also have special points. The altitude gauge shows the hight of water in hot water heating apparatus, indicating it accurately at the boiler. Edw. F. Keating, 75 John street, New York, is Eastern agent.

The United States Heater Company of Detroit, Mich., have elected the following officers for this year: President, Geo. A. Ducharme; first vice-president, A. T. Henderson; second vice-president, Jno. W. Mills; secretary, H. A. Smith; treasurer, Henry T. Cole. Mr. Ducharme is a prominent stockholder in the company who has been prevailed upon to take a more active post in the management.

The Jower Steam Heating Company of Brooklyn, N. Y., is a concern that was incorporated recently, with a capital of $20,000. The directors named are Charles Jower, William H. Jower, Marie Jower, Louise M. Helmle and Frank J. Helmle of Brooklyn.

The Armstrong Mfg. Company, Bridgeport, Conn., manufacturers of water, gas and steam fitters' tools, have removed their New York headquarters from 242 Canal street to the Cornell Building, 139 Centre street, where they will carry a full line of the well-known goods of their manufacture. The new offices are finely appointed, commodious and in every way suited to the large business done by the company.

The American Radiator Company, 92 Centre street, New York, are making preparations to secure a generous share of the radiator trade this year. W. H. Hill and W. P. Jenkins are additions to their corps of salesmen, and a large warehouse, with 45,000 feet of floor space, is being erected at Harrison, N. J., convenient to all the principal railroads, so that orders may receive prompt attention.

W. A. Russell has accepted the position of consulting engineer on heating and ventilation with the American Boiler Company, 94 Centre street, New York.

Hazen Mooers died early Saturday morning, February 3, at the family residence, 421 Juneau place, Milwaukee, Wis. Mr. Mooers was 69 years of age and had lived in Milwaukee since 1842. He was born in Clinton County, N. Y. For several years Mr. Mooers resided at Green Bay, but afterward he returned to Milwaukee and engaged in the steam fitting business. He was the senior partner in the firm of H. Mooers & Co.

The Wells & Newton Company are to occupy their new office on the ground floor of the Monadnock Building, 274 Dearborn street, Chicago.

The Ashley Nipple Holder.

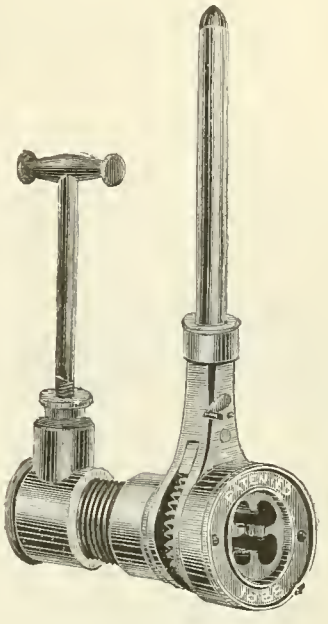
In order to adapt this holder for machine use the Walworth Mfg. Company of 16 Oliver street, Boston, shrink upon the square shank, shown in the small engraving, a piece of extra pipe of the length of the machine cylinder, extending the follower bolt to correspond. This permits the sleeve and hexagon collar to come without the face of the gripping chuck of the machine, while the head of the follower extends beyond the end of the cylinder. By this arrangement the operator is able to set up and release the nipple or change the sleeves without disturbing the shank of the holder. In cases where the speed is moderate these changes can be made without stopping the machine.

The different sleeves (or heads) corresponding to the size of pipe, being interchangeable, are easily screwed on to the shank by hand, when the hexagon collar, sliding along the square shank, fits over the hexagon end of the sleeve, securely holding it from turning either way, and taking the strain off the sleeve and shank thread. The piece of pipe to be threaded is screwed into the holder; the teeth on the face of the non-rotary follower within the sleeve (shown in small cut) are forced in contact with the end of the pipe by turning up the follower bolt, which prevents the pipe or nipple from turning in either direction, thus permitting the cutting of right or left hand threads. The holder being placed in a vise, the die is applied in the usual manner. The round end of the holder will enter the head of the die stock, so that the die may be run on until it comes in contact with the end of the holder, if desired, so that the shortest possible nipple required may be cut.

THE ASHLEY NIPPLE HOLDER.

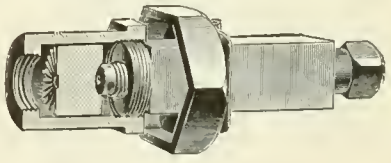
Climax Ratchet Stock.

Clarence M. Kemp, Baltimore, Md., is offering a ratchet stock, as shown in the accompanying cut. The tool is made entirely of malleable iron and steel, and is designed to be light enough in weight to be comfortably carried in a tool bag, and at the same time strong and heavy enough to stand hard usage and rough treatment. A feature of the tool is a vise attachment, which is located at the lower end of the handle, at the left of the cut. In operation the tool is slipped on the pipe to be threaded until the end of the pipe comes in contact with the die, and the handle is screwed up so the vise firmly grips the pipe. The ratchet handle is then rotated, which revolves the die, and by means of the leading thread carries the die on the pipe, cutting the thread. By reversing the pawl and moving the handle reversely the die runs off the pipe. It is explained that with this tool it is not necessary to dig up or take out the whole lengths of pipe, as the defective parts of the pipe



Climax Ratchet Stock.

can be cut out and the threads cut on the pieces in the ground with the greatest ease and convenience, not only saving time, but avoiding much unnecessary and disagreeable work. The manufacturer states that every tool is guaranteed, and any part can be duplicated if necessary; also that dies, if furnished, are extra. The tool is made in two sizes: No. 1, threading ¼ to 1 inch pipe, taking dies 2 or 2½ inches square; No. 2, threading 1¼ to 2 inch pipe, taking dies 4 inches square.



Holder Detached.

The American Copper & Brass Works of Cincinnati, Ohio, have just secured the contract for the copper work in the large anti-trust distillery about to be erected in Terre Haute, Ind. Randolph & Clowes of Waterbury, Conn., will furnish all the sheet copper and seamless drawn tubes used in the work. It is claimed that this is the largest single contract for this class of work hat has ever been placed.

Brick manufacturers of New York, New Jersey and Long Island will, it is said, form a trust.

The Legislature of Utah has passed a resolution protesting against that portion of the Wilson bill which affects the duty on lead ore.

TIN PLATES.

The British Tin Plate Trade.

The state of the British tin plate trade is by all accounts very discouraging, while the outlook for improvement is gloomy. In his report on the trade, the Liverpool correspondent of the London *Ironmonger*, under date of January 27, says that the market has been more idle than ever before, and there is no doubt that the trade is in a very bad way. Several works in South Wales which are now closed have, he says, avowed their intention to restart if they could book 2000 boxes at a price which would cover cost, but so far they have failed to do so. Both Siemens and Bessemer plates are offering in Liverpool at lower prices than have ever been accepted without finding buyers, "the only response being an offer of 6 pence a box less." The South Wales makers whose establishments are now in operation find it difficult to keep their works employed, and the *Western Mail* of Cardiff, a journal that is perhaps the foremost authority in the tin plate trade, states that over 5000 tin platers, including boys and girls, in the South Wales district, are idle, besides a large number of persons connected with other industries depending upon the tin plate trade. The loss in wages to those directly engaged in the trade is put by the *Mail* at over $57,600 weekly, while the employers' loss, at the low estimate of 6 pence per box, and taking into account the standing charges, cannot be placed at less than $20,000 weekly. These figures are based on the output of 160 mills now lying idle. The *Mail* franky acknowledges the competition of the American tin plate makers in the United States, and strongly urges the British manufacturers to turn their attention to the development of other markets for their product.

Tin Plate News.

The announcement is made from Elwood, Ind., that Col. A. L. Conger, president of the American Tin Plate Company, has disposed of his entire interest in the plant to W. B. Leeds of Richmond, Ind. Mr. Leeds was already a large stockholder in the concern, and this sale will give him the controlling interest. Colonel Conger, associated with some English capitalists, will make arrangements to build another tin plate works at the same place.

The Emlyn Iron & Steel Rolling Mills have arranged for their new plant at Summitville, Ind., and work has already begun on the foundations. The black sheets made by them will be tinned by the Chicago Tin Plate Works, which will form part of the same enterprise. Substantial buildings of brick, iron and stone will be erected, one of which is to be 200 x 80 feet, and two others will each be 150 x 80 feet. It was at one time reported that C. C. Clark and S. W. Allerton of Chicago were interested in these works, but both of them deny it. J. E. Jones is prominent in the movement.

At a meeting of the directors of the American Tin Plate Company, at Elwood, on the 3d inst., it was decided to increase the capacity of the plant to twice its present output, making it a ten-mill plant.

The Chicago Stamping Company are installing a tin plate plant in their factory in that city. They have put up two Phillips pots, and will add more as rapidly as they can get the tinning department in good running order. It is their intention to manufacture not only all the tin plate needed for their own consumption but also to enter the general market.

Norton Brothers of Chicago will shortly begin the manufacture of terne plate, introducing special features, which they believe will enable them to turn out a very superior quality of roofing plate.

SCRAP.

J. M. & L. A. Osborn, Cleveland, Ohio, have brought out a brand of terne plate under the name Eureka, which they say will rank with the best rolled plates in quality. The firm, besides making allusion to the excellent qualities of these plates, mention that they will be put on the market at a low price. They advise us furthermore that their line of roofing plates comprises 20 well-known brands.

Probably the lowest prices ever fetched by tin plates were recorded at Swansea, Wales, the other day, when 4175 boxes of coke plates from the Ysgitty Works, Langhor, were sold by auction, and realized an average of 6 shillings 9 pence, or $1.62, a box. The low figure is explained by the age of the plates, which had been stored in the Swansea Harbor warehouses for years, the Ysgitty Works having suspended operations some time ago.

Turkey uses about 500 tons of bright tin plates annually, all of which is imported from England. The only size handled is 20 x 14 in 100-pound boxes, containing 112 sheets. The gauge marks are peculiar to the Turkish trade, consisting of three, namely, I C, I C W and I C W W respectively. No terne plates are used in the Ottoman Empire.

The value of pig tin imported into Great Britain in 1893 was $12,312,355. Of this amount, $8,104,137 worth was re-exported to the United States and other countries, as well as $2,910,326 worth of native English tin.

At a meeting of the Board of Directors of the American Tin Plate Company, Elwood, Ind., held on February 4, under the presidency of A. L. Conger, president of the concern, it was decided to double the capacity of the plant. It has been found impossible to fill orders at the present rate of production—3000 boxes a week—but the increased facilities decided on will give a capacity of 1000 boxes a day, with employment for about 700 men.

A member of the trade who has recently accomplished a Western business tour in the course of which he inspected most of the large tin plate works west of the Alleghanies, reports a gratifying degree of activity among them. Orders in that section appear to be fully equal to their present capacity for production, in respect of both bright and terne plates, and in more than one instance makers mentioned their inability to meet the demand for goods to fill immediate needs. The outlook for the domestic tin plate industry in the West is generally regarded as favorable.

Mortimer H. Cort, lately a member of the well-known tin plate and metal firm of N. L. Cort & Co. of this city, who has recently opened a business as importer and dealer in tin plate, pig tin, sheet iron, zinc, &c., at 9 Burling alip, New York, is offering the trade a line of American bright and roofing plates made expressly for him. They include Iona, a bright charcoal plate, Alloway grade, made in standard sizes, IC and IX, and four qualities of terne plates, namely, Atlantic, Vigilant and Pacific, Worcester grade, and Dane of Dean grade, made in IC, 14 x 20.

The new tin plate plant which Hughes & Patterson, Philadelphia, have added to their works has started into operation with a few pots. The product at present is merely of a trial character and limited in volume. The establishment, however, is on a large scale, and will when complete be one of the most important tin plate works in the East.

The black plate department of Marshall Bros. & Co.'s Works, Philadelphia, is kept very busy on material for tinning purposes. A portion of the product is used by Messrs. Marshall in their own tin plate works, and the remainder is in great demand by other domestic tin plate manufacturers.

Imports of tin plate at San Francisco, Cal., during 1893 amounted to 40,068,735 pounds, valued at $1,155,672. During the same period 1,883,337 pounds of pig tin were entered at that port, the value of which was $378,362.

A cable dispatch from London intimates that a number of leading business men engaged in trade at Swansea, Wales, are negotiating for the formation of a direct line of steamers to carry the trade between Swansea and America. The former is the principal British tin plate shipping port, and is close to the largest tin plate works of South Wales.

To reduce the risk of fire at sea, the White Star Line will carry no more cotton on their transatlantic passenger steamers.

THE RETAIL STORE.

Representative Stove Dealers in Westchester County, N. Y.

The following notes from a correspondent concerning some of the representative dealers in stoves and hardware may prove interesting to our readers :

At White Plains will be found Charles P. Sherwood, who has one of the finest hardware and stove stores in the State. He devotes considerable time to the management of the business, and having had a large experience in this line, through his connection with the Richardson & Boynton company, possesses a correct idea of what a model retail hardware and stove store should be. The large bevel plate glass show windows are always tastefully arranged so as to attract the eye of the passer by. All shelf hardware being incased in boxes with samples on the outside, keeps the stock clean and always in its place. The counters are of hardwood, finished on top with mahogany. The ceilings are of the paneled type, from which hangs the stock of lamps, which is claimed to be the finest in the county. Mr. Sherwood makes a specialty of Richardson & Boynton's furnaces, and the Michigan Stove Company's and Eugene Munsell & Co.'s ranges and parlor stoves. The stove department is on the second floor.

T. S. Nedham, who occupies the store on the corner of Main and Center streets, enjoys a large trade, making a specialty of Boynton furnaces and Rathbone, Sard & Co.'s and Phillips & Clark's parlor stoves and ranges. Mr. Miller, the head salesman, has a great many friends in the vicinity of White Plains and draws considerable trade from his old acquaintances.

W. H. Sniffen enjoys the reputation of being a hustler. If there is any furnace or range to go in within a radius of 10 miles Mr. Sniffen is after it, and has had great success with Barstow Stove Company's Bay State furnaces. He also makes a drive on Orr, Painter & Co.'s Sunshine double heaters, having had a large trade in this line during the past season. Mr. Sniffen has a great many friends among the stove salesmen and they all like to spend a few hours with him.

R. T. Young of Tuckahoe runs a general store and during the season sells a good many ranges and parlor stoves made by Eugene Munsell & Co. and the Peekskill Stove Company.

George W. Robertson & Co. are at this place and make a specialty of Perry & Co 's Argand stoves and ranges. Mr. Robertson was formerly with George D. Furgeson & Co. of Mount Vernon, with whom he learned the business.

At Unionville George W. Quinby has a stove store, selling the goods of the Union Stove Works and Eugene Munsell & Co. Mr. Quinby devotes most of his time to plumbing and tinning, as there are many new jobs at Sherman and Kensico Parks, there having been over 200 homes erected in that vicinity last season.

At Pleasantville there are two stove dealers, W. T. Bailey, who makes a specialty of Eugene Munsell & Co.'s goods, and George W. Taylor, who sells Barstow Stove Company's line.

At Chappaqua, the home of Uncle Horace Greeley, J. T. Tompkins enjoys a good tin and stove business, selling Orr, Painter & Co.'s line of Sunshine ranges and stoves. Mr. Tompkins has been in that section for a great many years and remembers way back when we were all boys.

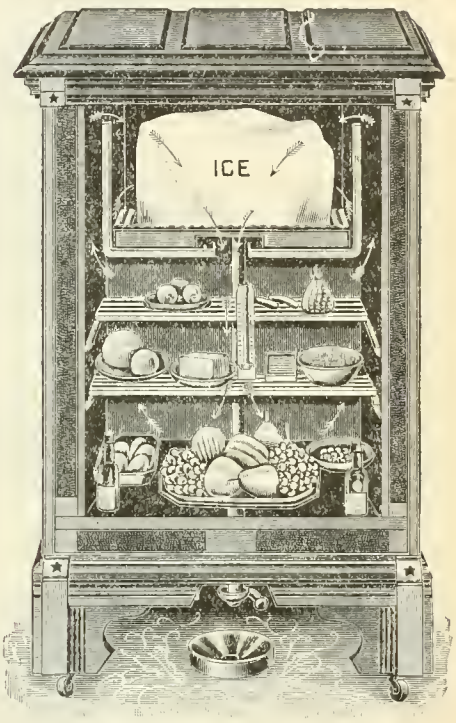
At Mount Kisco Ganun & Davis have what is considered the largest hardware and stove store between White Plains and Chatham on the Harlem Railroad. Centrally located, in the midst of a farming section, they enjoy a very large country trade as well as that of the village. Their leading lines of stoves comprise the Sunshine, Andes and Manhattan. They have recently added a grocery department to their store. Mr. Ganun manages the stove and plumbing departments, while Mr. Davis attends to the office work, doing most of the buying and managing the sales department.

J. H. Reynolds, at Bedford Station, makes a specialty of Argand, Manhattan and West Shore ranges and stoves, besides doing a general tinning and plumbing business.

H. W. Kellogg, successor to Kellogg & Elliott, is at Katonah. He carries a complete line of hardware, making a specialty of Perry & Co.'s Argand and Phillips & Clark's Andes ranges and stoves. Mr. Kellogg is also largely interested in the silk factory at Katonah, and is a great worker in the County Committee of the Republican party.

The North Star Refrigerator.

The accompanying cut illustrates an ingenious method adopted to demonstrate the peculiar points of the North Star refrigerator, manufactured by the G. M. Shirk Mfg. Company, 112 and 114 Lake street, Chicago. It was first tried at the World's Fair, and proved so successful and attracted so much attention that similar specimens have been furnished to the company's agents for show purposes. The cut shows one of the company's regular sizes of refrigerators, from which the back was removed and two panes of heavy glass inserted, with an air space of 1⅛ inches between them. This leaves the refrigerator in good working condition, but exposes the contents to full view, including the ice chamber, and at the same time shows how the walls of the sides are constructed. A refrigerator thus arranged was run for four months continuously at the World's Fair, with a thermometer inside to show the temperature. It contained various kinds of provisions, including tomatoes, eggs, butter and salt, also matches, which were kept dry. The tomatoes were changed but twice during the entire time, keeping perfectly fresh, and the eggs, which had been kept the entire time, were cooked and eaten at the close of the exposition. The temperature ranged from 39° to 40°, and the consumption of ice was 10 pounds daily, according to ice bills. The refrigerators

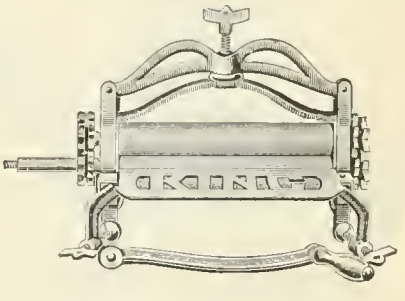


The North Star Refrigerator.

made in this way for show purposes are 45 inches high and 30 inches wide.

The King Wringer.

The accompanying cut represents an iron frame wringer, offered by the National Wringer & Mfg. Co., Canton, Ohio. The frame is entirely of iron and steel, every part being galvanized to render it rust proof, and is made with smooth iron bearings to make the wringer easy of operation. The springs are of oil tempered steel, which, it is



The King Wringer.

stated, are tested to 1500 pounds pressure. The rollers are referred to as being of the best quality of white rubber, solid through to the shaft, no twine or wire being used, vulcanized, and warranted by the makers not to become loose. The rolls are adjusted by a top screw in the center to insure an abso-

lutely even pressure on all parts of the rolls. The wringer is fitted with guides to prevent the clothes from running in between the frame and the end of the rolls. Particular attention is called to the fact that the wringer has gear wheels; also that it has all the features

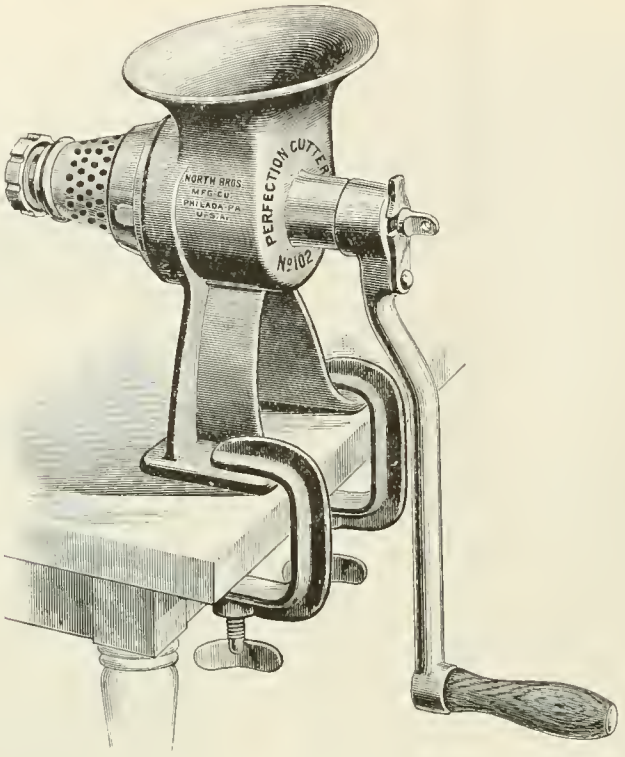


Fig. 1.—The New Perfection Cutter.

of all wood or iron frame wringers, besides many improvements. It is remarked that the King is an improvement over the Erie wringer made by this company, and is patented; patents on both wringers belonging to the company.

The New Perfection Cutter.

North Brothers Mfg. Company, Philadelphia, Pa., for whom John H. Graham & Co., 113 Chambers street, New York, are agents, are offering the cutter herewith illustrated as an improvement on the Perfection cutter

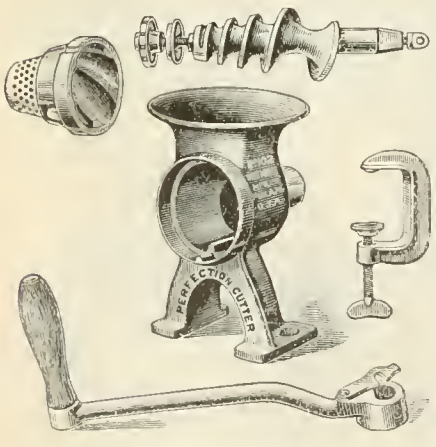

Fig. 2.—Parts of Perfection Cutter.

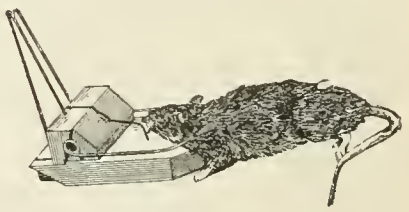
Nos. 1, 2 and 3. As improved the adjustment of the cone and the cutting screw is made by a nut and washer at the end of the cutting screw. As shown in Fig. 2, the cone is placed on the cutting screw, followed by a washer and nut, and the nut is screwed up tight, thus bringing the parts in close contact and ready for cutting. The adjustment is entirely confined to the cone and the cutting screw. It is explained that the frame becomes simply a convenience for holding the parts, so that the screw can be turned by the crank and the meat, &c., conducted into the parts to be cut. The hopper on the frame has been enlarged and the cutting parts raised higher from the table to allow more room for dishes, &c., to be placed under the machine. Another improvement has been made in attaching the crank. The crank and the shaft have corresponding flat surfaces, so that to take the cutter apart the thumb screw at the end of the shaft is given a half turn, the catch pushed to one side, when the crank can be taken off and all parts taken from the cutter. It is pointed out that in the construction special care has been taken to arrange every part of the machine so it can be easily reached with the fingers for cleaning. The machine is held in place on the table, either temporarily by two clamps furnished with each machine or permanently by screws, for which holes are drilled in the base, thus enabling the same cutter to be fastened either way. In use the meat, &c., to be cut is dropped in either large or small pieces, as desired. The pieces are forced forward by the screw to the cone, where they are cut between the sharp edges of the revolving screw and those of the stationary oblique knives in the cone, and finally to a uniform size by a further cutting in passing through the holes in the cone. It is stated that the work of cutting is thus advantageously divided, and that all unnecessary friction and waste of power is a voided. Any wear that may take place in the course of time in the cone or cutting screw is always taken up in putting the cone in the machine, and such wear, it is stated, instead of dulling the cutting edges, sharpens them. The cone furnished regularly with the machine has holes $\frac{5}{32}$ inch in diameter. Cones with holes $\frac{1}{12}$, $\frac{1}{8}$, $\frac{5}{32}$, $\frac{3}{16}$, $\frac{1}{4}$, $\frac{5}{16}$ or $\frac{3}{8}$ inch in diameter will be furnished when desired. It is stated that the machine will cut cooked meats of all kinds, chicken, lobsters, oysters, hash, suet, codfish, material for mince pies and fruit cakes, almonds, cocoanuts, stale bread, crackers, vegetables, raw meats, &c. The manufacturers state that in the new machine all the objectionable features in Nos. 1, 2 and 3 machines have been overcome. The present cutter is made in two sizes: No. 101, to cut 1 pound per minute, and No. 102, to cut 2 pounds per minute.

The Daisy Rat Trap.

The National Wringer & Mfg. Co., Canton, Ohio, are introducing the rat trap illustrated herewith. The steel springs are referred to as powerful and as

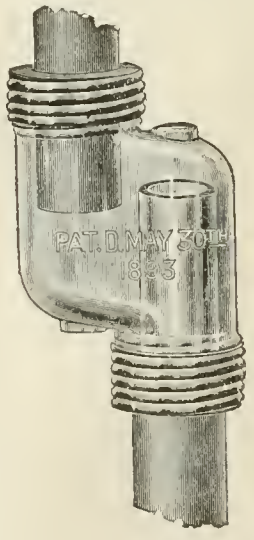


The Daisy Rat Trap.

always effective. The trap is sprung by moving the bait sideways or raising it. The trap is not inclosed, allowing the rat to enter from any side. The traps are fully warranted by the manufacturers to give satisfaction, and are packed one dozen in a crate.

The Hurd Glass Refrigerator Trap.

The Hurd Refrigerator Company, Duluth, Minn., are using the trap shown herewith in their refrigerators to prevent outside air and odors from getting into the refrigerator. The points of excellence claimed for the trap are as follows: It cannot rust and consequently cannot leak; being transparent



The Hurd Glass Refrigerator Trap.

the sediment can be seen and removed before the trap becomes clogged, and being of glass the dirt and filth from the ice will not cling to it as to metal, rendering it easy to keep it clean and sweet.

Improved Firm Joint Calipers.

The accompanying cuts represent firm joint calipers, which are being manufactured by L. S. Starrett, Athol, Mass. The improvement in the calipers is described as consisting in the construction of the joint, which is so made as to be drawn together by means of a screw forcing a washer on to a

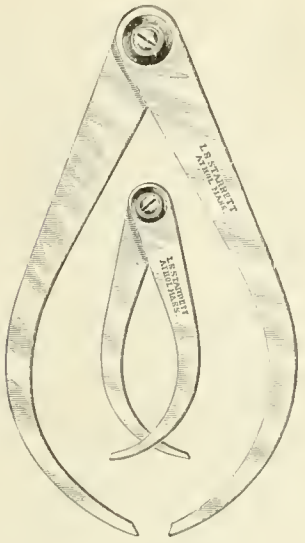


Fig. 1.—Improved Firm Joint Calipers No. 26.

squared end of the main rivet which extends through the legs, thus clamping them together between bearinga so shaped as to insure a smooth and uniform friction, of more or less tension,

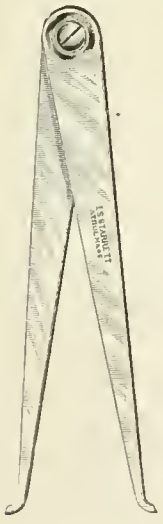

Fig. 2.—Improved Firm Joint Calipers No. 27.

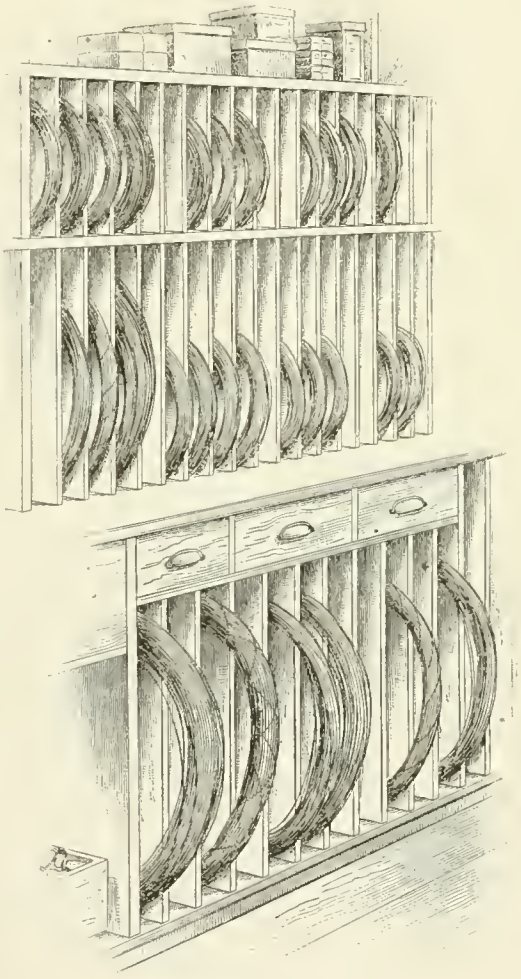
to suit the user. The quality of these calipers is referred to as superior to that of old style riveted joint calipers.

KEEN & HAGERTY, Baltimore, Md., have lately brought out an interesting little novelty which they have named the Jewel tooth and nail brush holder. It is made of sheet metal, with lithographed ornamentation, finished neatly in japan. It will hold any size of brush, and each opening is numbered, which, it is pointed out, prevents the danger of getting the wrong brush. Furthermore, by the holes the brushes are kept aeparate.

A Retail Wire Rack.

S. O. Burnett, 288 Fulton street, Brooklyn, N. Y., has in use a convenient method of keeping Wire from which to retail. The accompanying cut represents a portion of a rack used for this purpose and located at the back end of the store, being a continuation of the shelving on one side. It consists of three sets of bins of various hights and widths, and three drawers. All openings are marked on the partition boards with the size of the Wire each opening is designed to contain. On the top row there are 35 bins, each 12 inches high and 3 inches wide, containing copper



A Retail Wire Rack.

Wire from 16 to 23 gauge; annealed iron Wire from 18 to 24; tinned iron Wire from 18 to 21 and brass Wire from 20 to 22 gauge.

The second row from the top contains the same number of bins as the row above, of the same width, but 20 inches high. In these copper Wire is kept from 2 to 12 gauge and brass Wire from 1 to 19 gauge. The lower bins are each 4½ x 32 inches in size, except where the drawers reduce the hight 5 inches. In these 23 bins tinned and coppered Wire is kept from 9 to 11 gauge, and black iron Wire from 1 to 16 gauge. The drawers are used for iron and copper Wire on spools, also for short remnants of Wire that have been cut from the coils.

Cashing Checks.

Manufacturers and jobbers who give checks and drafts to their traveling men for expenses, writes an interior merchant, often place the wholesaler or retailer upon whom they call in an embarrassing place. To refuse to cash these checks seems very churlish or suspicious, yet men who put faith in them are frequently made to pay dearly for this. Often times the traveling man is making his first trip. He asks you to cash a check of Smith & Jones, payable to the order of Wm. Brown. You are compelled to take his word for it that he is the Wm. Brown, and if he is not you must staud the loss. You dislike to refuse his request; at the same time you know that there is some risk connected with cashing the check, and whatever decision you come to you are sorry for. The trade ought not to be placed in this quandary. Notice could be sent to special points direct from the house, and copy of the signature of the agent given. The house so written to could then pay the check with confidence.

MEMORANDA.

DUDFIELD BROS. have bought out A. F. Staples & Son, at Lathrop, Mo., and will do a stove, tin, hardware, plumbing and heating business.

WITH the very appropriate title "Cold Facts," the Grand Rapids Refrigerator Company of Grand Rapids, Mich., issue a unique publication containing a great deal of interesting matter on the subject of refrigeration. It is a 24-page pamphlet, pocket size, with a neat cover. The theme is naturally the Leonard Cleanable refrigerator. The special features of this style of construction are treated in an admirable manner, with numerous illustrations and lucid descriptions. They are brought out so effectively that the little book must prove a very competent salesman for this line of goods. Small but very handsome cuts are given of the different styles of refrigerators made by the company.

STOVE TRADE NOTES.

Cupola Management.*—III.

BY DR. EDWARD KIRK.

Spout.

The old way of making a cupola spout is to place a short piece of pig iron on the bottom plate on each side of the front, and build up a spout between them with clay or loam. The modern spouts are made of cast iron with a flat or eight-square bottom, and are from 4 to 6 inches deep, 7 to 10 inches wide and 1 to 10 feet long. They are given a fall from the cupola of about 1 inch to the lineal foot, and are lined with a refractory material to protect them from the molten iron. The spout lining is made of a different material from the sand bottom, and generally consists of molding sand, loam or a mixture of fire clay and sharp sand. Some of the molding sands make an excellent spout lining that is not cut or fused by the stream of molten iron, while others crumble and break up too readily when cleaning the spout of dross and dirt, and cannot be used for this purpose. When a molding sand can be used it makes a nice clean spout that is easily and quickly made up. It is readily dried, and when making up the spout the crust of the old lining can be removed with a bar, and the sand wet up and used over with a coating of sand without removing it from the spout. For long spouts, requiring a good deal of material to line them, molding sand is the most economical lining that can be used.

Some of the loam and blue clays make excellent spout linings alone or when mixed with sand, and are the only materials used for this purpose in some sections of the country where they can be produced at a moderate cost. They make a stronger lining than molding sand—that is, not so liable to be broken up when cleaning the spout of dross and slag—and, furthermore, they dry quickly. The lining material probably more extensively used than any other is a mixture of fire clay and sharp sand. These two refractory substances when combined in right proportions and thoroughly mixed make one of the very best spout linings. But when not properly mixed they make one of the poorest linings.

When too much clay is used the lining does not give up the water of combination until heated to a very high heat, and it is almost impossible to get the lining dry so the iron will not boil in the spout the first few taps when the spout is long, or sputter and fly when it is short. It cracks when dried rapidly and is melted into a tough slag that bungs up the spout and cannot be removed without destroying the lining. When too much sand is used the lining crumbles when touched with the bar and is cut and melted by the stream. When the clay and sand are not thoroughly mixed the lining crumbles and cuts or melts in spots. A spout lining made of these two materials in right proportions, properly mixed and dried, becomes as refractory as a fire brick and 50 or 100 tons of iron may be run from a spout lined with them without a break in the lining. There are a number of other materials used for spout linings that are only found in certain localities and their use is restricted to the districts where they can be procured at a moderate cost. But those above described are the materials most commonly used for this purpose.

The spout lining is made up new every heat, and when putting it in the spout is wet to make it adhere to it. The sand bottom is cut away from the front and the spout lining made to extend into the cupola past the tap hole. A perfect joint is made between the sand bottom and spout lining, and a little clay wash is generally brushed over the joint to make it more perfect and prevent cutting. Care must be taken to not get the bottom of the spout at the tap hole higher than the sand bottom, and also to give it the same pitch as the sand bottom. The bottom is put in first and is made about 1-inch thick when the spout has been given the proper pitch. If the spout has not been given a proper pitch the lining is made heavier at the end next the cupola and light at the outer end and the pitch given in the lining. This is the common practice in short spouts.

The sides of the lining are built up full at the bottom so as to leave only a narrow groove in the middle and keep the stream always in one place, but are sloped back from the middle to the top of the spout to give a broad spout surface for carrying the stream of iron. A half round groove 1 inch deep and 2 inches wide at the top is sufficient to carry off the stream of iron from almost any cupola. But the spout is liable to be choked up by dirt from the tap hole or slag and it is made large for safety. A rammer is seldom used in making up a spout and it is generally made up with the hands and one of the bod sticks, or the small round stick used to make the tap hole.

When molding sand is used it is worked a little wetter than for molding and is beaten down with the bod stick and shaped up with the hands and bod stick. When clay or a mixture of clay and sand are used it is worked wet and placed in the spout in balls and beaten or pressed into shape with the hands, and the bod stick is used to true it up and form the groove in the middle. Short spouts are made up with but little difficulty, but great care must be taken in making up a long spout to have it perfectly true and properly pitched so that it will clean itself of molten iron the moment the cupola is stopped in.

The greatest strain upon the spout lining is under and around the tap hole where it is liable to be cut away by the pressure and current of the stream or to be melted if the material is not very refractory, and it may be broken up by the tap bar if not very tenacious when heated to a high temperature. When molding sand or other materials that do not stand a high temperature well or are not very tenacious when heated are used, a layer of fire clay and sharp sand is placed over the lining material under the tap hole. When the heat is very heavy and a large amount of iron is drawn from one tap hole a split fire brick is embedded under the tap hole to prevent cutting and insure a good tap hole throughout the heat. The spout is seldom coated or painted with blacking after it is made up or dried, but when a friable material is used for lining it is sometimes coated with clay wash.

If the spout is made with a broad, flat bottom the stream takes a new course every time the cupola is tapped, and before the heat is over the spout is so bunged up that the iron collects in pools. A continuous stream cannot, therefore, be maintained the length of the spout and two or more streams may fall from the end of the spout at the same time. To prevent this shape the lining to form a small groove for the stream in the center and keep it there every tap. The quality of the lining material has a great deal to do with the condition of a spout during the running off of a heat. The spout may be cut out in holes by the stream and pools of iron form in the spout at every tap. This is due to the lining material crumbling and being washed away by the stream. When this does not occur every heat with the same material it is due to the material not being properly mixed, but if it does occur every heat it is due to poor material. The spout may become choked or bunged up with slag when no slag flows from the tap hole with the iron. This is due to the lining melting and forming a slag. It is very difficult to keep a spout in order through a long heat when this occurs, and the lining material should at once be changed. Slag should be removed from the spout when very hot by lifting it up with a bar or chipped away with a sharp bar when quite cold. All attempts to remove a tough semi fluid slag breaks up and destroys the lining.

*Copyrighted, 1894, by Edward Kirk.

ODD PLATES.

THE UNION STOVE WORKS of 70 Beekman street, New York City, resumed operations at their foundry in Peekskill, N. Y., on Thursday, February 1, giving employment to some 200 hands. The company are able to report a fair spring business, to which the wintry weather experienced at intervals during the past few weeks has given a stimulus.

THE NORTH MILWAUKEE MFG. COMPANY of Milwaukee, Wis., have recently been incorporated, with a capital stock of $250,000. Among the goods to be manufactured are mentioned stoves and ranges. The incorporators are S. A. Drake, G. A. West and A. D. Agnew.

THE A. J. LINDEMANN & HOVERSON COMPANY of Milwaukee, Wis., have issued an illustrated price-list of gasoline stoves, ovens and sheet metal goods which they are offering the trade. The stoves are made under the names Anchor and Star, and include high and low juniors, single generator, individual burner and process stoves. In connec-

tion with the illustrations are given various particulars concerning the goods, together with prices of the various sizes of stoves made. The catalogue also shows single and double valve burners, torches, ovens, elbows, dripping pans, &c.

THE MICHIGAN STOVE COMPANY of Detroit, Mich., are now employing more than 1000 men on part time, the object being to give work to as many hands as possible, even though the orders do not warrant running full capacity. The majority of the men have found employment three days in the week, and for some of the time the shops have been kept running even longer, but last week the plant started on five days' time, which will be the rule until it is possible to operate full capacity. When asked by the representative of a local paper about the business of the company, George H. Barbour is reported to have said: "We have not the assurance of specially heavy business this year, and it is possible that after the spring has reached us we will have to go a little slow, as we may have a light summer trade. Of course we might wait until the season opens and the times are better, but we have decided that we will have to make stoves in some number, if ever so small, and my idea is and has been that we owe it to the unfortunate men around us to give them a chance to work at this time when it is so hard to live, and when work is the greatest charity that can be offered. If a man is able to earn $12 when the season is good and the shops are running full time, he can earn $6 by working half time, and this will go a long way toward the support of his family. When it is possible to run the shops five days in the week the men then only lose one-sixth of their wages, and they can get through the winter all right and do not have to call for help from any one."

AT THE ANNUAL MEETING of the stockholders of the Grander Stove Company, Royersford, Pa., the reports presented showed a very satisfactory volume of business to have been transacted during the past year. A large number of stockholders were present, among the number being George Holt, T. T. Rockett and Wesley Rockett of Philadelphia, Lewis Dauth of Reading, Adam Grander, John Flint, John N. Iselt, W. S. Price, Washington Smith, J. M. Lewin, Wells Taylor, Willis Lewin, Benjamin Carver, S. B. Latshaw and Farney McKee. The directors elected were John Flint, Adam Grander, W. S Price, Washington Smith and John N. Isett. In accordance with their usual custom the stockholders held their annual dinner at Schultze's *café*.

THE WILLIAMS STOVE LINING WORKS of Taunton, Mass., resumed operations on Thursday, February 1, after a brief shut down for the purpose of taking account of stock.

THE STOCKHOLDERS of the Yeager & Hunter Stove Mfg. Company of Spring City, Pa., recently held their annual meeting, at which the following officers were elected: James G. Yeager, president; F. M. Hunter, vice-president; J. Elwood Yeager, secretary, and J. E. Yeager, treasurer.

THE TRUSTEES of the Fuller & Warren Warming and Ventilating Company of Troy, N. Y., have re-elected the following officers: President, Gurdon G. Wolfe; vice-president and general manager, W. F. Wolfe; secretary, William Henry Warren; treasurer, Joseph Mackey.

THE NEW YORK STOVE WORKS recently resumed operations in the various departments of their plant at Peekskill, N. Y., with nearly 100 workmen, and in a few days expect to be running full capacity.

THE PERRY STOVE COMPANY of Albany, N. Y., resumed operations in the various departments of their works on Monday, February 5, giving employment to a force of 150 hands.

"MANY REASONS WHY the West Shore Range is Superior to All Others," is the title of a little pamphlet of 20 pages which reaches us from the Littlefield Stove Company of Albany, N. Y. Within the colored paper covers the stove is illustrated and described at considerable length, as are also the four inventions on which the company so largely base their claims to superiority. Another feature of the pamphlet is found in the directions for putting up and starting a fire in the West Shore range. The alterations in this construction for 1894 include a new base frame which sets the range 1¼ inches higher, new legs for the low closet, raising it 3 inches higher from the floor, a new kicker for the oven door, and a new and better method of fastening to its place the grate front. The company state by this alteration the entire grate fixtures can be taken from their place and a new set substituted, simply by the use of a screw driver.

THE DIPPO MFG. COMPANY of Chagrin Falls, Ohio, is the name of a concern recently incorporated for the purpose of making what are known as Ferrosteel ranges. The plant which they have erected has a capacity for 100 workmen and the goods turned out are meeting with a gratifying reception at the hands of the trade. The castings are said to be of a fine and even texture, the mixture, so they say, being covered by letters patent already allowed or pending. The fire box of the Ferrosteel range is fitted with any one of four different styles of grates, as may be preferred, the ash pit is capacious and easy of access and every door when open forms a shelf. The lids employed are heavy, while the reservoir is placed nearer the fire than is usually the case and has a capacity tor 30 quarts. In other particulars the range is carefully constructed and all points duly considered. The ornamentation is of a neat and attractive character, and the manufacturers are confident that the stove will grow in popularity as the merits become better known to the trade. G. H. Dippo, the general manager, was for some time the superintendent of the Eclipse Stove Works of Mansfield, Ohio, and brings to his position a wide and varied experience. A. D. Hatfield, secretary and treasurer, is a chemist of ability and has had considerable experience in office management.

CHARLES E. COLEMAN, representing the interests of Eugene Munsell & Co., 218 Water street, New York City, reports a gratifying demand for the company's line of Manhattan stoves, ranges and gasoline goods Mr. Coleman covers New York State, Western Connecticut and Massachusetts in the interest of the stove department, visiting his friends twice during the year. Six months of the time he travels exclusively in the interest of mica and micanite, visiting street railways, electrical manufacturers, hardware jobbers and stove makers in all the large cities of the United States and Canada.

J. D. MARVIN, formerly connected with the Fuller & Warren Company, will this year travel in the interests of the Perry Stove Company, looking after the trade in New York City and the State of Connecticut.

HOPES ARE ENTERTAINED by the foundrymen at Albany, N. Y., that the present stagnation will not long continue and there seems to be a much easier feeling than existed two weeks ago. J. Van Wormer & Sons shut down in the latter part of December and at that time had a large stock on hand. Their traveling salesmen went out on the road January 30 and the result of their canvass will deside largely when the works will resume operations again. Mr. Van Wormer says that pig iron is very low and he thinks there will be no necessity for a cut in wages when the plant resumes operations. The Townsend Furnace works are running full time in both the foundry and machine shop. In the latter not a full quota of men are now employed, but in the foundry every man is getting all the work he can do.

THE WARREN HARDWARE COMPANY, 7 Market street, Warren, Ohio, refer to the Warren Steel range, which they manufacture, as being made of the best quality of cold rolled sheet steel, the flues being lined with asbestos, the fire linings sectional and extra heavy and the oven so bolted and braced that it cannot warp. Five sizes are made for family use and two with double oven and end fire box for hotels, restaurants, &c. In style, finish and mechanical construction the Warren range is referred to as being first-class in every respect.

THE PERRY STOVE COMPANY of Albany, N. Y., announce for the season of 1894 larger and more complete lines of oil, gas and gasoline stoves and furniture than ever before. The goods include, among others, three sizes each of popular, medium and low priced lamp stoves, a new line of three sizes of gas hot plates, embodying special features, and four varieties of the Royal oil stove having three and four 4-inch burners, and three, four and five 5-inch burners. The company also state that they have made an arrangement with the manufacturers of the Dangler gasoline stove for the exclusive agency of their entire line for the territory covering the whole of New England, New York and Florida, together with the greater portion of the States of New Jersey and Pennsylvania. James S. McGee, who has been with the company for 19 years, is manager of the New York branch at 109 Beekman street.

THE H. FRANKE STEEL RANGE COMPANY, Cleveland, Ohio, expect to have their new ranges ready for the trade about March 1. The company claim they will have a number of new features never before found in a steel range, patents on which are pending. The company have had a very successful year, much credit being due M. M. Koch, the manager.

THE ANNUAL MEETING of the stockholders of the Bloomington Stove Company, Bloomington, Ill., was held Monday, January 22, at which William Van Schoick was elected president, John W. Evans, secretary and treasurer, and Howard E. Hayes superintendent. The above, with E. H. Miner and H. H. Chrisman, constitute the Board of Directors. All things considered, the stockholders were well pleased with the volume of business for the year 1893. The company state that their Illinois

salesman, F. M. Bean, is succeeded by M. N. Hagaman, who for the past four years has looked after their interests in the State of Iowa. The latter territory will be covered by T. Henderson of Des Moines. The company send us circulars of a cook stove and line of oak heaters which they have brought out for this year's trade. The cook stove is known as the Central, adapted for coal or wood, and embodies the modern improvements. The heaters are known as the Perfect Oak, offered the trade in four sizes, and the Grand Oak, made in two sizes. We understand it is the intention of the company to shortly add to their assortment some new Todd stoves.

The Peninsular Stove Company of Detroit are said to be well pleased with the present volume of business and also with the outlook for the future. Trade is picking up very well, all things considered, and the prospects appear to be that it will continue to improve. The company have been running their foundry the past 30 days and are busy with spring shipments of cook stoves, ranges and steel goods, and are booking orders on furnaces for future shipment.

The Smith & Anthony Stove Company, 217 Lake street, Chicago, report that their trade in heating furnaces and plumbing goods for January of the present year was larger than for the corresponding month of 1893.

An important announcement comes to us from the Gobeille Pattern Company of Cleveland, Ohio, to the effect that they have completed arrangements whereby they are able to take contracts for "pattern castings and iron patterns, filed, fitted and follow-boarded." The company state in their announcement that they guarantee their castings to be soft and true to patterns, and in case of dissatisfaction they may be returned, the company paying charges both ways. The new department of the business, we understand, will be carried on with the same promptness and attention to details which have characterized their wooden pattern work. Pasted to the notice is a little slip bearing the headline "A Bargain." It states that the company have almost ready for shipment a set of wooden patterns for a cook range, 18 and 20 inch oven. The firm for whom they were made have gone into liquidation and the company will sell the patterns at cost.

George H. Barbour, vice president and general manager of the Michigan Stove Company of Detroit, has been visiting Henry E. Stanbach, resident manager of the company's branch in Buffalo. While in the city he was interviewed by a representative of the Buffalo *Evening Times*, and expressed his opinions as to the measures taken in Detroit looking to the relief of the poor and needy and also upon the condition of general trade. Mr. Barbour considers the depression largely due to a lack of confidence and does not think that the Wilson bill will appreciably affect the stove trade. He considers that the worst of the panic is over and that the time of the year is approaching when factories must open and when people must buy goods, however economical their intentions.

We have received from H. Rendtorff & Co., 16 Lake street, Chicago, specimens of the circulars which they are now distributing to the trade. One is an illustrated folder of gasoline stoves and ranges. The goods treated of in this folder comprise the Ideal cabinet range, which is made in two styles, with or without a step; the Ideal process stove with two or three burners, and with or without a step; Ideal high juniors, with either fixed or lay down tanks and with two or three burners? Ideal low juniors, with fixed or lay-down tanks, and with one to three burners. Another circular presents large cuts of the Ideal cabinet range and the Ideal process stove. A third circular treats of the Royal lamp stove, which is a one burner oil stove, having an extra large reservoir, which is a solid cored casting, with no joints to leak and highly japanned. The firm also handle the Beauty oil stoves and ranges in 13 styles and sizes, the Ideal oil heater, the Ideal gas stoves and ranges and a complete line of refrigerators.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

Richter & Co. of Milwaukee, Wis., were awarded the contract for the heating and ventilating apparatus of the Tenth Ward School for $3850. At 20° below zero the temperature in the building is to be maintained during the test at 70°. By this system 30 cubic feet of fresh air per minute for each pupil is also guaranteed, with a complete change of air in the building every ten minutes.

The Richmond Steam Heating Apparatus was used by Capt. Thomas McManus in the three apartment houses which he erected at Fifth avenue and 115th street, New York.

Among the contracts recently taken for steam heating by the Illinois Heating Company, 88 Lake street, Chicago, can be mentioned the following: Four flat buildings of Corse & Jeffery, Vincennes avenue and Forty-fifth street; two apartment buildings of Ringer Bros., Colorado avenue, near Kedzie avenue. and residence of R. A. McWilliams, Fifty-fourth street, near Ridgewood court

The Kelly & Jones Company, 58–62 North Clinton street, Chicago, are to furnish steam heating plants for the First Regiment Armory building, Michigan avenue and Sixteenth street; the Van Dyke, a high class apartment building and hotel combined, Michigan avenue and Fortieth street, and the Pierpont, an apartment building of unusual size, Barry and Evanston avenues.

J. G. Webber, 244 North Clark street, Chicago, is to do the plumbing, sewerage and gas fitting in the 60-flat building of Dawson Bros., Paulina and Walnut streets.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until February 27 for work, including the plumbing for the United States Post Office building at Fremont, Neb. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the superintendent at Fremont.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until March 2 for work, including the plumbing of United States Custom House and Post Office building at Tallahassee, Fla. Drawings and specifications may be obtained from the Supervising Architect, Washington, D. C., or from the superindendent at Tallahassee.

The work of putting the steam heating apparatus in the new Post Office building at Atchison, Kan., has been completed, and the work has been inspected by Samuel I. Pope of Chicago, the steam heating contractor.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until March 1, for low pressure return circulation steam heating and ventilating apparatus for the United States Post Office building at Cedar Rapids, Iowa. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the superintendent at Cedar Rapids.

Thomas P. Aitkins has the contract to do the plumbing of the large building being erected by Hartmann & Goldschmidt on Main street, Manchester, Conn.

Tobin & Addis, Plainfield, N. J., have recently completed a fine job of plumbing in the residence of a railroad official in which they used three Standard baths, three Sanitas water closets and a Sanitas kitchen sink and flushing pot.

J. Barham is remodeling the plumbing of the Grant Cottage, at Long Branch, N. J., for the present owner, using three Sanitas roll rim baths and two Sanitas showers. One bathroom is wainscoted with marble 7 feet high and has a marble floor.

The Exeter Machine Works, Boston, Mass., are in receipt of a very flattering letter from Codding & Taft, Worcester, Mass., respecting the advantages of the Exeter radiators, which they describe as unsurpassed in point of beauty and good circulation. Among recent work Messrs. Codding & Taft have installed these radiators in seven houses and two blocks at Worcester, Mass.; also residences and other buildings in Waltham, Spencer, Colebrook Wilkinsonville, Newton, Auburn, South Framingham and Brockton, Mass.; Marvin, N. H., Providence and Olneyville, R. I.

The School Board of La Salle, Ill., have ordered two Eduction closet ranges, of eight and nine sections, from the Walcott-Hurlbut Company, 175–177 Lake street, Chicago.

M. J. Carboy, 78 Dearborn street, Chicago, has the contract for plumbing and gas fitting in the Van Dyke apartment building, Michigan avenue and fortieth street.

The illustrated catalogue issued by the Meriden Malleable Iron Company, Meriden, Conn., presents engravings of a very extended line of brackets for sinks, tanks, seats, shelves and lavatories, as well as lavatory legs, fixtures, &c. These plumbers' supplies are shown in every degree of elaborateness from the simplest to the most ornamental. In addition to all the illustrations, particulars of prices and sizes are given. After many pages devoted to brackets and legs there are similarly illustrated an extended line of hooks and pins, towel racks, paper holders, cigar rests and lavatories. In a prefatory note to this catalogue the Meriden Malleable Iron Company say that they do all the nickel, silver and gold plating with a process exclusively their own, which enables them to finish these goods to correspond with any fixtures or decorations employed in the artistic furnishing of residences, hotels and public buildings.

TRADE REPORT.

The Iron Market.

The developments during the past week have emphasized the tendency toward improvement. As yet the better feeling is very unevenly distributed and in some branches of the trade sellers smile very skeptically over the sanguine utterances made. Even where the improvement has been most marked it is regarded merely as a flash in the pan by many.

During the week there have been placed orders for about 30,000 tons of Billets in the Pittsburgh market and about 11,000 in the Chicago market. There have also been sales in the East. The low sellers have marked up their prices and belated buyers have been forced to pay $16 @ $16.25, Pittsburgh. The Wire industry has now covered for the next few months and a waiting game may develop. If there is any considerable demand for Soft Steel in the near future prices will hold and may harden. It depends now whether other consumers of Soft Steel will gather in enough business to force them to cover. The usual stories of a short interest are again afloat.

Northern furnaces seem to be doing a little better among the founders, while the markets controlled by the Southern product are dull and weak. The producers of standard Irons have been making a drive at their customers recently. The latter, while contracting for the old brands, seem to believe that they have ample time to talk to the sellers of the newer Irons later on.

Pig Iron.— Reports in the trade in the New York market differ quite widely. Sellers of Southern Irons report a dull market, while agents of standard Northern brands note a better inquiry and report the placing of contracts for delivery up to the middle of the year. In some cases they have succeeded in marketing Iron very close to the furnaces in Northern New York. We quote standard brands $13 @ $13.50 for No. 1; $12.50 @ $13 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $13.50 for No. 1; $11.75 @ $12.50 for No. 2; $11.50 @ $12 for No. 3; $11.50 @ $11.75 for No. 2 Soft, and $12 @ $12.50 for No. 1 Soft.

Philadelphia advices intimate that there is no very decided change in the Pig Iron situation in that market, but such as there is appears to be in sellers' favor. Consumers are more inclined to talk business, and in some cases are taking larger lots, and as a rule without concession in prices. Sellers appear to be gathering courage, and while they do not feel warranted in asking more money, they are not disposed to consider anything that involves concessions. The supply of Iron is still quite liberal, so that it is hardly likely that there will be any material change in prices. Sales are increasing somewhat, but there is no difficulty in placing orders at last week's prices, and until there is a bigger demand, or a smaller supply, it is not likely that prices will improve. General quotations for Philadelphia or near by points are about as follows:

No. 1 Foundry	$13 00 @ $14.00
No. 2 Foundry	12.50 @ 13.25

Local Coke Iron was much more active last week in Chicago than during the previous week. It is known that one large consumer, who has for a long time been very conservative in his purchases, concluded that the time had arrived to stock up and therefore placed contracts covering his wants for the greater part of the year. His prominence in the trade causes his action to have a favorable effect on other buyers of Foundry Irons. The foundry trade shows signs of improvement and quite a number of prominenent foundrymen are of the opinion that from this time forward business in this line is bound to increase. Lake Superior Charcoal continues very quiet. Quotations are given as follows, for cash:

Lake Superior Charcoal	$15.30 @ $15.50
Local Coke Foundry, No. 1	12.50 @ 13.00
Local Coke Foundry, No. 2	12.00 @ 12.50
Local Coke Foundry, No. 3	11.75 @ 12.00
Local Scotch	13.00 @ 13.50
Ohio Strong Softeners No. 1	15.00 @ 15.50
Southern Silvery, No. 1	..... @ 13.75
Southern Silvery, No. 2	..... @ 13.25
Southern Coke, No. 2	11.50 @ 11.65
Southern Coke, No. 3	11.00 @ 11.50
Southern, No. 1, Soft	11.50 @ 11.65
Southern, No. 2, Soft	11.00 @ 11.50
Tennessee Charcoal, No. 1	16.00 @ 16.50
Tennessee Charcoal, No. 2	..... @ 15.00
Alabama Car Wheel	18.00 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

Foundry iron is reported as in slightly better demand in the Pittsburgh district, and $11 is now asked for No. 2, delivered. Quotations are given as follows:

No. 1 Foundry	$11.75 @ $12.00, cash.
No. 2 Foundry	10.75 @ 11.00 "

In Southern Pig Iron markets there has been little more than a jobbing demand from the foundries during the week, mainly in carload lots, which, however, foot up in the aggregate rather more than for any of several past weeks. The market is a weak one for all grades of Southern Iron, with offerings at 25¢ @ 50¢ less ℔ ton in many instances. There seems, however, to be no disposition on the part of buyers to anticipate their wants. It is evident, nevertheless, that many of the weak furnaces which have made low prices are out of the market as sellers now. Quotations are merely nominal, as follows:

Southern Coke, No. 1	$11.50 @ $11.75
Southern Coke, No. 2	10.50 @ 10.75
Southern Coke, No. 3	10.00 @ 10.25
Ohio Soft Stone Coal, No. 1	15.25 @ 15.50
Ohio Soft Stone Coal, No. 2	14.25 @ 14.50
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	17.50 @ 18.00
Hanging Rock Charcoal, No. 2	17.50 @ 17.75
Tennessee Charcoal, No. 1	13.50 @ 14.00
Tennessee Charcoal, No. 2	12.50 @ 13.00
Standard Southern Car Wheel	17.00 @ 17 25
Lake Superior Car Wheel and Malleable	16.50 @ 17 00

Metal Market.

Pig Tin.— Prices for Straits Tin have averaged somewhat lower and the market has remained in somewhat dormant condition. Neither consumers nor jobbers have purchased except in a very perfunctory way. Some sales have been made privately at about 19.85¢, net cash, for prompt and near future delivery. Jobbing parcels went at corresponding prices, or, say, at 20¢ @ 21¼¢ from store, according to size. Those figures fairly reflect market value at this writing and the inside rate is very close to the cost of importation. Dealings in futures are still restrained more or less by the uncertainties surrounding the Wilson tariff measure, and poor condition of general trade also has a certain degree of unfavorable bearing, sentimentally at least. The statistical position is given as follows in the Metal Exchange circular:

Shipments:	January. Tons.	December. Tons.	November. Tons.
Straits to Great Britain	2,050	2,900	1,950
Straits to Continent	1,100	925	750
Straits to United States	430	300	200
Total	3,580	4,125	2,900

December 1		14,523	15,175

Copper.— Several sales have been made of Lake Superior Ingot at 9⅝¢ for prompt and near future delivery. About 50,000 pounds were involved. There are offers now at 9¾¢ by sales agents of some producers and at a shade less from second hand, but it is claimed that no large amount can be secured under 9⅝¢. Naturally the pronounced weakness in this class of the metal has had a depressing influence upon values of other varieties, forcing Electrolytic down to 9⅛¢ and ordinary casting stock to 9¼¢ where other than ordinary small jobbing parcels may be involved. Business at the lower price involved no important quantities, and the demand has not improved to any marked degree. Jobbers report, nevertheless, that although the demand is commonplace and below expectations, yet sales have been somewhat larger the past week than during the one preceding, while prices remain fairly firm. Small lots of Lake Ingot from store are quoted at 11¢.

Sheet Copper.—Inquiries for Cornice Copper have been rather more numerous, but have not as yet to any extent crystallized into orders. Still, the feeling among the trade is more cheerful, and it is hoped that the coming weeks may bring forth more activity in this respect as the prospects of spring and early summer business open out more clearly.

Pig Lead.—There has been a further advance in prices. Single carload lots of common Western are sold at 3.35¢ and holders are now asking 3.40¢ upward. Only routine business has been done at the advance, however, and the demand is extremely commonplace at the present time, with hardly any interest shown except in moderate quantities for near future delivery, outside of a speculative circle in which a considerable amount of Lead is supposed to be held. The demand from smaller consumers has been of a quite limited character, they confining themselves to purchasing only such quantities as they may need for current use. Prices for small lots are fairly firm at about 3⅛¢ @ 4¢ per pound.

Spelter.—Late good purchases at primal points, along with more or less curtailment of production, have had sufficient force to carry a shade higher and impart greater firmness to the tone of the market. Thus far sales have not been made other than choice brands at above 3.65¢ here or at common point, but sellers are now generally asking 3.70¢ upward, and offer very reservedly. Very few will take orders at that price for delivery prior to April 1.

Tin Plate.—Despite the fact that extraordinarily low prices are quoted for spring and early summer deliveries, the demand for futures has been exceedingly slow and dealings only spasmodic. The amount of stock involved has been also considerably below the average for this season of the year. Spot business has also been disappointing and irregular. This is, at any rate, the experience of the majority of dealers, although some in the trade speak of an improvement both in orders and inquiries over those of the past few weeks. Moreover, a tendency is noted to the consideration of larger quantities in individual transactions. Consumers in general, however, show as yet little or no disposition to anticipate their wants, hoping that prices, which have been dropping for so long, may go yet lower. Prices, while showing no radical change, are weak, and there seems little difficulty in obtaining any kind of Plates at the lowest rates made this winter.

Sheet Iron.—Black Sheets are exceedingly slow of sale, except those suitable for tinning. Stocks of the former are ample to meet all the likely demand. Prices are irregular, depending largely upon circumstances. As a rule, it may be said, they are entirely in purchasers' favor. Galvanized Sheets are in but moderate demand, prices remaining steady.

Chicago Report.

Scrap.—Wrought is still neglected, but there is a fair movement in Cast. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb.
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....

Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—The representatives of the great Eastern mining companies held a meeting here on the 30th ult., and decided to stop all rail shipments from the mines to the West for the remainder of the winter. It was calculated that there was enough Coal now in cars at all important points to last through a good part of February. The ample stocks of the Coal companies on the docks at Chicago, Milwaukee and Duluth will furnish supplies for the Northwest during the rest of the winter. It was thought the Lehigh Valley would join with the rest in these drastic measures to prevent a landslide in prices. Carload lots of 12 net tons or over are nominally quoted as follows, but these rates can be shaded about 50¢.

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45

Trade Notes.

SUMMERS BROTHERS & Co., Struthers, Ohio, manufacturers of Box Annealed Sheet Iron and Sheet Steel, are putting down a 22 x 24 inch cold rolling mill and expect to have the same in operation about March 15 next. The Sheet mills of this concern are working right along, but their puddling department is not averaging more than one week in a month.

THE SHARON IRON COMPANY, Limited, Sharon, Pa., are putting in a galvanizing plant and expect to have it in operation about March 1 next.

THE SPECIALTY WOOD WORKING COMPANY of Warren, Ohio, makers of Enameled Handles, Pail Woods and Knobs, report an excellent demand for their goods. The company are three months behind orders, the enameling department being enlarged, and new machinery is being added to the turning department.

THE JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, N. J., issue an intereating little pamphlet entitled "Graphite as a Lubricant," being the second edition of the work. After an introductory note a number of pages are devoted to pointing out the advantages of this lubricant, quotations from eminent authorities being included.

THE PALERMO MICA COMPANY, 27 Peck slip, New York, issue a catalogue particularly addressed to the electrical trade, in which they call attention to their pure N. H. Electrical Mica, made in all sizes, and also present a price-list of selected New Hampshire Mica, as well as their Silver Amber Sheet Mica. Of the latter they announce that they are prepared to furnish a superior quality cut to any desired size.

WALLACE & SONS, Ansonia, Conn., now in the hands of receivers, have made a proposition to the creditors of the concern to pay them 60 per cent. of the fair value of their claims, or they will place the whole business in the hands of the trustees to be run for the benefit of the creditors.

WM. L. WHIPPLE, 47 and 49 Manton avenue, Providence, R. I., has enlarged the plumbing department of his business to meet the requirements of an increasing trade. He was recently awarded the contract for the plumbing and ventilating in nine new houses on Eddy street.

CONDITION OF THE

Hardware Trade.

TRADE continues to improve, which is a natural result of the advance of the season and the necessary preparations for spring business. Manufacturers and merchants are soliciting orders earnestly, and a force of travelers perhaps nearly as large as usual is on the road. The result is a volume of business of fair proportions. Most of the orders for general goods are comparatively small, dealers sorting up carefully and awaiting the setting in of an active demand from their customers before buying with old time liberality. In some lines of goods, notably Wire Nails and Barb Wire, there is an improved tone in prices and an excellent demand. The trade on the whole are taking a much more cheerful view of things than for a long time past.

Advices from Chicago.—The volume of business transacted by Shelf Hardware jobbers is steadily increasing and prospects are regarded as considerably better than they were at the beginning of the year. The demand is, however, still running more largely to staple goods than to straight Hardware. Country merchants realize more strongly that Wire Nails and Barb Wire are a good purchase at the existing prices at this time of the year and do not hesitate to take in good stocks. This has brought about an unusual demand, which swells the value of business now current. The demand for seasonable goods has been met for the time, as the field has been pretty well covered now by the salesmen of the several houses. Orders for straight Hardware are confined to small lots for sorting up and will probably not increase to any considerable extent until the time comes for an actual demand from consumers when the building season opens. Heavy Hardware jobbers report a better volume of trade in Iron and Steel, but no special increase in other departments.

Notes on Prices.

Wire Nails.—There continues to be an excellent demand from both wholesale and retail houses, and as a result the mills are well occupied on orders. While there has been no quotable change in prices, the tone of the market, in sympathy with the advances which have taken place in the raw material, is stronger, a fact which has also the influence of stimulating orders from careful buyers who are watching the market closely. The market is represented by quotations ranging from $1.10 to $1, the latter figure being exceptional and given regularly only on large and attractive orders. The New York market is represented by the quotation of $1.20 on dock, with small lots from store at $1.25 to $1.30.

Advices from Chicago.—The manufacturers of Wire Nails report a continued strong demand from all classes of buyers. The mills are now so well filled with ordersthat the makers are apparently in command of the situation. Jobbers who bought what they thought they needed about two weeks ago are now trying to duplicate their orders or otherwise enlarge them and attempting to secure the old rate, in which they are not meeting with much success. Merchants are ready to buy for April delivery, but manufacturers are disinclined to take orders so far ahead with the advance now going on in Steel Billets and Wire. Manufacturers' quotations are, in the majority of cases, about $1.20, Chicago, and the few who are below this are expected to advance their rates in the next few days. Small lots from stock are selling at $1.20 to $1.25, but these low rates will have to be withdrawn if the heavy demand continues for any length of time.

Cut Nails.—The Cut Nail market continues in substantially the same condition as described in our last report. There is an increase in the volume of business and prices remain steady at former quotations. The Western market is represented by the quotation of $1 to $1.05 at mill. The Eastern Cut Nail manufacturers quote $1.05 for carload lots on dock, New York, and are adhering strictly to their agreement to discontinue quoting Nails at factory and are naming only prices for Nails delivered.

Advices from Chicago.—The Cut Steel Nail trade has not experienced the movement shown in Wire Nails, nd yet there has been a steadily improving demand with some orders of good size placed during the past week. Manufacturers are quoting factory lots on the basis of $1.05, Chicago, on a 60-cent average. Jobbers report only a small local demand, and are quoting from stock at $1.15 to $1.20.

Barb Wire.—As the result of the conferences which have been held by the manufacturers, and the active demand of the past few weeks, the Barb Wire market is in a perceptibly improved condition, and is characterized by a stronger tone. There is not, however, as yet entire uniformity in the quotations made by different manufacturers, some of whom are holding Galvanized Four Point at $2 15, while others have not as yet announced the withdrawal of recent quotations.

Advices from Chicago.—The manufacturers of Barb Wire held a meeting in this city on Monday, at which the situation was thoroughly canvassed and the fact brought out that very heavy orders had been booked by all the factories. Taking into consideration the improvement in the demand and the advance in Billets and Wire Rods, an effort is to be made to advance prices on Galvanized Barb Wire to $2.15 at Pittsburgh and Cleveland, and $2 25, Chicago, as the bottom rate for largest lots. Jobbers report a much better demand from their customers and state that the country merchants are sending their orders in by mail instead of waiting for the salesmen to call for them. Prices for small lots have been inclined to weakness at $2.30, but the change in the attitude of manufacturers will evidently have a strengthening tendency.

Traps.—Oneida Community, Kenwood, N. Y., announce revised discounts on their line of Traps as follows:

	Discount per cent.
Newhouse	50 and 10
Hawley & Norton	75 and 5½
Victor	75 and 10 and 5
All Steel	80
Star	60 and 10

Steel Set Screws, &c.—Under date February 1, Reynolds & Co., New Haven, Conn., issue a new list on Steel Set Screws, which is 25 per cent. higher than the list on Iron Set Screws, instead of 50 per cent. higher as heretofore. Other Steel Screws, such as Square Cap Screws, Hexagon Cap Screws, &c., the price on which has heretofore been 50 per cent. higher than for corresponding Iron Screws, will hereafter be also furnished at 25 per cent. advance. The discount on these goods remains as before, but it is announced that on purchases of Set Screws, Square and Hexagon Head Cap Screws, Milled Studs and Coupling Bolts aggregating $500 during the six months ending July 1 or January 1 a rebate of 5 per cent. will be allowed, and provided such purchases amount to $1000 or upward during the same period a rebate of 10 per cent. will be allowed. It is also stated that dealers' full discounts and privileges will be allowed to any and all Hardware supply houses in good standing irrespective of whether they carry a stock of these goods or not.

Shot.—The price of Shot has again declined, a further reduction being announced by the manufacturers under date of February 5. The marked decline which has occurred within the past few weeks is owing in part to the low prices ruling on lead, but there is also an unusually active competition among the manufacturers. Following are the present prices, terms 30 days, or 2 per cent. discount for cash in ten days from date of invoice:

	Per bag.
Drop Shot, sizes smaller than B, 25 pound bags	$1.20
Drop Shot, sizes smaller than B, 5-pound bags	.35
Drop Shot, B and larger sizes, 25-pound bags	1.45
Drop Shot, B and larger sizes, 5-pound bags	.40
Buck and Chilled Shot, 25 pound bags	1.45
" " " " 5-pound "	.40
Dust Shot, 25-pound bags	2.00
" " 5-pound "	.45

In lots of 2000 pounds and upward taken at one time a discount of 5 cents per bag (25 pounds) will be allowed, together with a special discount of 2½ per cent.

Tacks.—The Atlas Tack Corporation are issuing, under date January 24, a

revised discount sheet on Hardware list goods, and also a revised Shoe Finders' list. The prices thus announced represent the market on this line of goods, other manufacturers making the same prices. The revised discounts on Hardware list goods, "straight weights," are as follows, which are subject to an additional 33⅓ per cent., and 2 per cent. for cash:

Goods, Papered, Dozened and M's.

The discounts named above are for Straight weight goods, but an extra 5 per cent. is announced on Star weights, an extra 10 and 5 per cent. on Standard weights, and an extra 10 and 10 per cent. on Special weights. On the back of the discount sheet a schedule of the above weights is given.

Ames' Shovels and Spades.—Under date February 1 Oliver Ames & Sons' Corporation, North Easton, Mass., announce a discount of 20 per cent. on all their goods, except the following:

Reed & Lindsay, list Nos. 548 to 572.
Lee & Hadwin, 838 to 880.
Hadwin Drain and Ditching Spades, Nos. 1004, 1009, 1014, 1019, 1024, 1027 and 1029,

and on these goods they will allow a discount of 27½ per cent. They will also allow an extra discount of 10 per cent. to all parties whose net purchases from them exceed $500 for six months. In addition to the above named discounts they will allow at the close of the season, July 1, 1894, a further discount of 5 per cent. to all parties whose net purchases from them exceed $750 during said term. This extra discount is not to be deducted before the expiration of the six months, and is to be forfeited by all parties who have sold their goods at greater discounts than first named. Freight is prepaid to Boston and New York, and all goods are at risk of purchaser after shipment from factory.

Radiators.—Under date of February 5 the American Radiator Company, Chicago, Ill., issue to the trade a new price-list for 1894. In a circular letter accompanying the list they refer to the reductions that have been made in prices, and add:

"We would call your attention, particularly, to the large reduction in price we have made on low hights, the demand for which has grown to such proportions as to justify large investment in machinery and other special patented devices enabling us to produce them at reduced figures. We trust our many friends and customers will appreciate our policy in making this large and abrupt reduction in the price on these and other goods, and let us take this opportunity to again assure the trade that we can always be relied upon to take the lead in all measures which aim at the expansion and development of the Steam and Hot Water Heating business, by those methods which alone can produce lasting and beneficial results. Were we to sacrifice quality, workmanship and those well known and acknowledged scientific principles of construction in order to reduce selling prices, we feel that we would not only be doing ourselves, but the trade in general, great injury. We have, however, in our regular styles and patterns, always adhered strictly to what we believe to be the proper theories of Radiator construction, and such reductions as we have made in our prices have always been accomplished without making sacrifices to quality or workmanship, or by following a shortsighted policy of advocating certain ideas of construction possessing the single advantage of cheapness in production."

We reprint the new list, which is as follows:

National. Perfection. Ideal.

Added to prices quoted for Direct Radiators.

All the foregoing prices are f.o.b. factory, less carload rate of freight to any railroad point of destination east of the Mississippi River and north of Tennessee or North Carolina.

Indirect Radiators.

Excelsior Steam.

12 square feet per section..$1.60 per section.

Excelsior Water.

12 square feet per section..$1.80 per section.

F.o.b. factory, less freight allowance, as above.

Perfection Pin Indirect, for Steam and Water.

Standard size, 10 square feet, $1.35 per section.
Extra large, 15 square feet, $2.10 per section.
F.o.b. factory, less freight allowance as above.
Terms: 60 days or 2 per cent. discount for cash within ten days.

Glass.—The demand for Glass is slow and prices are unsatisfactory. No changes of importance have taken place in the Glass market since our review of last week, and prices named at that time fairly represent present quotations. The market is weaker rather than stronger than a week ago, jobbers and manufacturers each making

prices to suit the requirements of the case. It is reported that the idea of closing all factories February 10 has been abandoned, and it is understood that at present prices sufficient money can be realized on the Glass manufactured to meet current expenses.

Old Metals.—Business in Old Metals continues extremely dull, except in a few lines of Scrap Iron, for which rather more inquiry is reported. Prices continue low and irregular, the following quotations representing those usually paid by New York dealers for moderate quantities:

Heavy Copper	℔ lb 7¢
Light and Tinned Copper	℔ lb 6¢
Heavy Brass	℔ lb 5¢
Light Brass	℔ lb 4¢
Lead	℔ lb 3¢
Tea Lead	℔ lb 2½¢
Zinc	℔ lb 2¼¢
No. 1 Pewter	℔ lb 15¢
No. 2 Pewter	℔ lb 6¢
Wrought Scrap Iron, ℔ gross ton	$7.00 @ $8.00
Heavy Cast Scrap, ℔ gross ton	7.00 @ 8.00
Stove Plate Scrap, ℔ gross ton	4.00 @ 5.00
Burnt Iron, ℔ gross ton	2.50 @ 3.00

Old Rags, Paper, &c.—The market for these materials gives but little evidence of activity and prices continue weak. Quotations for New York delivery are nominally as follows:

No. 1 White Rags	℔ lb 3¼ @ 3⅛¢
No. 2 White Rags	℔ lb 2¼ @ 2⅛¢
Mixed Rags	℔ lb ¾¢
Blues and 3ds	℔ lb 1 @ 1¼¢
Hard Sized White Shavings	℔ lb 2¼ @ 2⅛¢
No. 1 White Book Shavings	℔ lb 2 @ 2⅛¢
No. 2 White Book Shavings	℔ lb 1 @ 1⅝¢
Light Book Shavings	℔ lb ¾¢
No. 1 Mixed Shavings	℔ lb ¾ @ 1 ¢
No. 2 Mixed Shavings	℔ lb ½ @ ¾¢
No. 1 Printed Books	℔ lb 1 @ 1¼¢
Ordinary Mixed Books	℔ lb ½ @ ¾¢
Newspapers	℔ lb 2-5 @ ½¢
No. 1 Manila Paper	℔ lb 1 @ 1⅛¢
No. 2 Manila Paper	℔ lb ⅝ @ ¾¢
Bogus Paper	℔ lb ½¢
Common Paper	℔ lb ⅜¢
Straw Chips	℔ lb ½¢
Binders' Clippings	℔ lb ½ @ ⅝¢
Jute Butts	℔ lb 1⅞ @ 2 ¢
No. 1 Jute Bagging	℔ lb 1 @ 1¼¢
Mixed Bagging	℔ lb ¾ @ 1 ¢
No. 2 Bagging	℔ lb ½ @ ¾¢
Hemp Twine	℔ lb 2 @ 2¼¢
Manila Rope	℔ lb 2¼ @ 2⅜¢
Jute Rope	℔ lb 1½ @ 1¾¢
Mixed Rope	℔ lb ¾ @ ⅞¢

Old Rubber.—The market for this material remains very quiet. New York dealers' prices are nominally as follows:

Car Springs, ton lots, ℔ lb.	@ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@ .03
Rubber shoes, less than carloads, ℔ lb.	0.02¼ @ .03⅛
Large Hose, ℔ ton	@ 9.00
White Wringer Rolls, ℔ lb.	@ .04¼
White Syringes, ℔ lb.	@ .05

An important sale of a block of property on lower Broadway, New York, is reputed to have been arranged, the purchasers being certain Chicago capitalists, whose intention, it is said, is to erect there an immense 18 or 20-story office building. The purchase money mentioned is $2,700,000.

The police of New York have been engaged in compiling an accurate census of the unemployed labor in this city. The results of their investigations, which have not yet been promulgated, will be particularly interesting if the report discriminates between *bona fide* workmen out of employment and the chronic idlers.

Corrugated Iron in 1893.

As an illustration of the effect on one of the important branches of the iron industry of the money stringency and the tariff discussion during the summer and fall, and also as showing the decline of trade generally during the year, we are permitted to present the following synopsis of the year's business of one of the prominent manufacturers of corrugated iron and iron and steel roofing:

We compare business of one year with previous years in three ways. 1. Amount in dollars and cents. 2. Amount of tonnage sold. 3. Number of squares sold. Sales for 1893, as compared with 1892, show loss as follows:

	Per cent.
Loss in dollars and cents	27
Loss in tonnage sold	28
Loss in squares sold	24

For the five months of 1893 ending May 31, as compared with the same period in 1892, the gain in dollars and cents was 49½ per cent.

Our first loss in sales for 1893, as compared with 1892, was shown September 30, when the loss was 2½ per cent.

October, November and December of 1893, as compared with the same months in 1892, tell a very instructive story and show the bottom knocked completely out. The results are shown below:

	Dollars. Per cent.	Tonnage. Per cent.	Squares. Per cent.
Loss in October	58	58	54
Loss in November	80	79	74
Loss in December	86½	80	80

The average loss in the three months, as compared with 1892, being in round numbers as follows:

	Per cent.
Dollars	74
Tonnage	72
Squares	69

This large loss in business was not caused by our being afraid to do business, but simply from the fact that business in our line seemed to be practically suspended.

The annual report of the Chicago Board of Trade shows that the business of the board in 1893, although less than that of 1892, was greater than in any other year. Receipts of grain and flour in bushels were 247,000,000, only 8,000,000 bushels less than in 1892. The shipments for actual consumption and for export last year were more than 100,000,000 bushels of grain, 4,100,000 barrels of flour, 956,000,000 pounds of pork product and 1,257,000,000 pounds of beef and beef product, aggregating a value of not less than $250,000,000, making Chicago the greatest provision mart of the world.

Reports from Grand Rapids, Mich., intimate that the furniture manufacturing industry of that district is quite flourishing in spite of the general depression. All the factories are running on either full or part time and have orders enough to keep them busy until July.

The Senate Committee on Agriculture have favorably reported on a bill appropriating $1,000,000 for the extermination of the Russian thistle. This prolific weed has become a serious pest in portions of the country, particularly in the Northwest, where large tracts of land have been overrun by it and rendered useless for agricultural purposes.

Heat and Electricity

It has long been known that electricity can be directly generated by heat through the use of what is called the thermo-electric pile. Descriptions of the construction and operation of these piles abound in works upon electricity, but it has been found in their use for electrical purposes only that they are not economical as compared with dynamos or batteries. A large quantity of heat is wasted, and only a very small portion of it is available for the production of electricity. A great deal of study and inventive talent has been devoted to the improvement of thermo-electric piles, but, so far, they have been of little practical or commercial value. A new lead has been opened, however, by Dr. Paul Giraud in combining a thermo-electric pile with a heating stove or furnace, in which combination the heat ordinarily wasted in the use of this apparatus is utilized for heating purposes. In this improvement a very high economy is said to have been reached in the double function of heating and lighting buildings by one and the same apparatus. One difficulty, however, seems insurmountable. The apparatus can be used economically only in cold weather, and in summer other means of lighting must be used. There are many who have not yet abandoned the belief that the thermo-electric pile is destined at some future time to become an efficient means for the supply of electricity, and that its present defects will be much abated if not wholly removed. Should this expectation ever be realized, combinations of heating and lighting apparatus will come into general use.

Dangers of Exhaust Ventilation.

An important fact to bear in mind in weighing the relative merits of the exhaust and plenum systems of ventilation is the danger under the former system of vitiating the atmosphere of a house by gases and odors drawn from any adjacent source. The atmospheric pressure constantly seeks equilibrium. In ascending to high altitudes the air within the body expands, and in escaping through the skin produces distressing effects. A reversal of this process is met with in coal mining, where disastrous results have followed the exhaust system of ventilation, for by drawing out the air from the mine workings the dangerous fire damp was sucked in from outlying pockets and through every crack and crevice in the coal. A similar effect may occur in a building ventilated by the exhaust system. By reducing the pressure within doors by means of exhaust fans every communication with the outer air becomes an inlet duct. Cracks around the windows and the crevices about the doors are conduits of pure air, but the same cannot be said of the waste pipes and cellar openings. A well trapped system of plumbing would resist the slight inward pressure of an ordinary exhaust ventilating system, but it must be remembered that traps are sometimes sealed little, if at all, and every inward tendency of air would increase the danger of filling the house with that mixture of live germs and foul odors collectively known as sewer gas. In a tight apartment it would be possible to reduce the indoors pressure enough to make the atmosphese bubble rapidly through an ordinary plumber's trap. The greater the natural ventilation in the house the less this danger, but it should always be borne in mind that there is a possibility of the entrance of air from sources that had better be cut off.

Philadelphia Mechanics.

The majority of the mechanics of Philadelphia are in a better condition, financially, to struggle with hard times than those of any other large city in the United States, and probably in the world. This is largely due to the fact that there are thousands of small houses in all parts of the town which can be bought at reasonable prices. A small first payment will obtain the deed, and the other payments and the interest are so adjusted that the annual sum exceeds by a small sum the rent charges. Practically the purchaser is given his own time in which to pay for the home. He can pay a fixed amount yearly, and in addition he can reduce the principal at any time and by any sum he chooses. What is of first importance is that this system provides the incentive to economy. He cannot obtain a home in a city like New York, where he can obtain apartments at any desired rate, but in a building he never dreams of owning, as its value so far exceeds his means. The difference is that between small independent houses and those built on the tenement house plan. Therefore in times like the present the Philadelphia mechanic has some resources, in the shape of real estate paid or partly paid for, which will carry him until trade improves. Having acquired the habit of saving for a particular purpose, he can now reduce his current expenses to a greater degree than if he had never learned how much a dollar was worth.

Articles on Steam Fitting.

In the department of Steam and Hot Water this week we continue the publication of a series of articles, begun some time ago, on the practical work of pipe connection for steam heating jobs. The articles are written in an exceedingly simple way by a practical man, who has had a very extensive experience in steam heating work of all kinds. A valuable feature of the contributions is the illustrations, which show in the plainest way the pipe connections and the method of doing the work. The accompanying text is purposely made brief, so that the reader will not be confused by a needless waste of words. All the explanation necessary, however, to give a thorough comprehension of the subject is presented. The instruction afforded by these articles we consider particularly valuable, for it is of a sort to appeal more especially to the plumbers and others who are taking up the work of steam heating and wish to become thoroughly familiar with all the details, and it is becoming generally recognized that the success of a steam heating plant depends more upon the distribution of the surface and the proper pipe arrangements than it does upon the particular boiler installed in the cellar. These details of work, which are so essential, are often learned only at the end of a costly experience, and any instruction that will tend toward lessening errors of design and construction will be welcome to the trade.

British Board of Trade returns for the year ending December 31, 1893, show a large decline in the foreign trade of Great Britain. The total imports for the year were $1,944,464,112, a decrease of $89,876,122 as compared with those of 1892 and of $145 783,555 as compared with 1891. The value of British exports in 1893 was $1,048,768,381, a falling off of $41.187 874 from those of 1892 and of $137,946,739 from the exports of 1891. The returns for the month of January make a more favorable showing than has been the case for some time past. Imports during the month increased $25,584,000 as compared with the corresponding month last year, and exports increased $624,000, compared with those of January, 1893.

Press Working of Sheet Metals.—I.

BY OBERLIN SMITH.

Introductory.

Of the origin and history of the art of metal work as performed in dies, operated by presses, we know but little. The numberless wonderful and beautiful operations of to day, most of which it must be acknowledged, however, tend rather to cheapening and unifying than to beautifying the articles produced, are merely the results of a long course of evolution, tending constantly to a survival of the fittest methods. Regarding the progress of the art as a whole, it cannot be said that any one age shines out upon the pages of history, or that any one inventor has made himself immortal. Processes identical in principle with many of our modern ones were undoubtedly practiced by that master metallurgist and machinist, Tubal Cain, and by the long line of skilled artificers who have been his disciples and followers adown through all the ages which have gradually created civilization.

This civilization in its modern glory and its far greater glory yet to come may be regarded as almost wholly dependent upon the noble art of metal working in its various branches; for we cannot conceive of the existence of the constructions and instruments of modern engineering and other sciences if we were limited to such primitive materials as wood and stone.

Fundamental Principles.

In choosing the specific subject of this article, differentiating the general theme of metal working by selecting sheet metals, and this again by limiting ourselves to the operations of a particular class of tools, we must not lose sight of certain fundamental principles which underlie the art as a whole; considering the important divisions of casting, forging and finishing, as well as press working, but omitting reference to purely chemical and electrical processes.

It may be well just here to say that the four process defining verbs employed near the end of the last sentence are used in a commercial and technical sense rather than in a scientific one, as they somewhat overlap each other in exact meaning. This is readily seen when we consider that casting, which generally means the running of molten material into a mold by the force of gravity merely, sometimes also means the forcing of the same thereunto by means of a pump, or its equivalent, as in type casting and the Whitworth pressure system of steel casting. From this it is but a step to the drop forging of white hot iron in the dies of the drop press or (in other materials) to the pressing to shape of semi-molten glass, or of cold soap and candy. The differences are chiefly those of the degree of plasticity in the substance treated. We thus find no very distinct line of demarcation between casting and forging, for much of the ordinary blacksmith's work is analogous to drop forging, except that his tools are not as highly specialized, and do not so completely give their own form to the work. Again, we find that finishing (in the sense here used of paring and scraping or abrading the surface of the metal to more accurate shape, as in machine shop processes) is partly included in a blacksmith's work, as in chiseling, filing, &c. Still again, we shall see that press working may, and sometimes does, include all of the processes referred to—*e.g.*, forcing into molds, as in casting; cutting, shearing, punching, smashing, bending, stretching, compressing, &c., as in forging; and paring, &c., as in finishing.

In general, however, it may be said that press work has much more in common with forging than with the other processes in question, and that it bears the same relation to the blacksmith's or the coppersmith's work that printing does to the scrivener's art, or chromo making to oil painting, or a knitting machine to one's grandmother. In any of these cases we have on the one hand a mechanico-reproductive process wherein the brain of the designer has been expended upon specialized tools which will produce predetermined articles, all exactly alike, for the benefit of the millions; in many cases, unfortunately, with but little embodiment of the æsthetic. On the other hand, we have much more expensive products, each made singly as the individual child of the artisan's brain, and each differing in some degree from its brethren. Should the artisan happen to be also an artist, as were the stone cutters of Greece and of mediæval Europe, the gold, bronze and iron workers of old Italy and Spain (but as are not, alas! the most of our metal workers of to-day), then his beauty loving individualism in mechanical work serves as a leaven to leaven the lump of ugliness that tends to crush down all love of the beautiful in this intensely utilitarian age.

Referring again to certain general principles underlying the mechanical working of metals (at any rate, in all the processes mentioned except finishing), we have as one necessary condition a molecular structure which will enable the particles to flow among themselves when the proper force is applied. In the case of casting this occurs at a temperature at which the particular metal in question happens to become a perfect liquid or nearly so. In forging the flow usually takes place at a bright red heat, although sometimes the metal is cooler than this, or even entirely cold—this latter term meaning here (and throughout this treatise) the ordinary temperature of the atmosphere. In press work the metal is sometimes heated, as in forging, but in the great majority of cases it is handled cold.

The other necessary condition, besides a capability of approximately non-elastic flow in the material worked, is the employment of certain tools that will first cause this flow and that will then limit it, so as to produce the predetermined shapes required. In ordinary casting these tools consist of the molds to inclose and limit the shape, together with a proper pouring tube (wherein the sprue or gate is formed) to give "head" or pressure to the metal. In forging, they consist of the surfaces and corners of hammers and anvils, together with horns, swages, fullers and other more specialized tools. In that modification of a forge shop called a rolling mill, the tools in question, of course, consist of the surfaces of the rolls, whether they be cylindrical to produce sheet metal, or grooved in various ways to produce bars. In press working the forcing tools are the press rams, while the limiting and shaping operations are performed by the dies.

Probable Origin of the Press.

Before proceeding to a practical analysis of the press working art as we find it existent to-day, it will be well to recur once more to the historical aspect of the subject, that we may trace its probable beginnings back in the primitive ages of the world's history. The first man who chanced to dig up a little nugget of native gold or copper, or some other man who found a piece of malleable metal in the ashes of his fire as a result of the accidental smelting of certain ore happening therein, may very probably have pounded it out thinner between two stones, and thus have become the first sheet metal manufacturer. If he then cut it in two by lapping it over the sharp edge of a stone and sliding another one down past it, he had invented the first shearing press. If he pushed the end of a sharp stick through it into a hole in a stone underneath he was doing the first punching. If the upper tool was rounded off so as not to cut through, he was making a little cup by the process of forming or stamping. Thus simple are most of the operations that we still perform in sheet metal work. We have improved them only in detail, gradually involving better and better tools, to the end of obtaining more and more accuracy, uniformity and rapidity of production. The transition from a punch or upper die, held in and guided by the hand, to a simple machine wherein the same was guided by being attached to a moving ram, was but a natural one and something that required no great inventive ability.

Definition of Metal Working Press.

A general definition of the word "press," as used for the purposes with which we are concerned in this treatise, might be written as follows: A machine on which a bed or anvil is approached by a ram or hammer, having a reciprocating motion in a line approximately at right angles to said bed, and the said ram being suitably guided in the frame work of the machine that it may always move in the same path. It will thus be seen that the two important members in any ordinary press are the bed and the ram, and that they are only a more highly specialized form of the blacksmith's anvil and hammer or of the still more primitive large stone and small stone used by the predecessors of Tubal-Cain. The general essentials in such a machine are a massive and rigid bed with a flat and true surface upon which to fasten one of the dies; a rigid frame work extending toward and surrounding the ram that it may slide, or sometimes swing, therein with a considerable degree of accuracy; means for taking up lost motion caused by original looseness of fitting or by subsequent wear; and a somewhat massive and rigid ram, carrying proper means for fastening and securely holding the other die. The surface of the ram nearest the bed is usually flat and parallel thereto, although for some shearing work and occasionally for rough punching a ram is allowed to swing in the arc of a circle, usually being itself in such case a part of one arm of its operating lever. In the vast majority of cases, however, a ram is of cylindrical or prismatic form, sliding accurately in true bearings in the frame of the press. These bearings should, if the machine is of correct design, be of great length in proportion to the thickness of the ram, the object of thus maintaining the ram rigidly in its predetermined path of motion.

being to always bring the dies together with the same relation to each other, that they may not be injured and that the work may be uniformly shaped thereby.

The causes which tend to destroy this accuracy of motion are: 1. The springing of the ram itself, when made too slim and when projecting too far out of its bearings. 2. False motions (sidewise) in its bearings, either by their not embracing it tight enough or by their being so short as to magnify by means of the leverage the slight looseness which is necessary in any working bearings. 3. The springing of the frame out of its normal shape at points between its bed and the ram bearings. It may therefore be said, in general, that it is almost impossible to make these parts of a press too clumsy, and that the more metal they contain, within reason and consistently with the space available, the better they are, especially as they want not only the strength to keep them in position, but all the inertia possible to prevent vibration when acted upon by the powerful and often rapidly applied forces necessary to move the ram.

Hereafter in this treatise certain parts shown in the illustrations will be uniformly referred to by the following letters: F for press frame; *b* for the bed thereof, which is usually but not always a part of the same casting; R for ram; P for plunger; L for lower die; U for upper die; U′ for drawing punch or inner upper die; M for matrix; K for knock out; S for stripper; G for gauge; *p* for pressure between ram and bed in the line of ram's axis; *t* for throat, and M for metal or other material to be worked in the dies. The other essential parts pertaining to presses and dies are so numerous that no definite system can be maintained in referring to them. The nomenclature herein used will follow conventional practice as far as is feasible, but in names with a number of synonyms the word which seems the most in accordance with common sense will be selected. A case in point is the ram of a press, which, called by this name, seems to be expressed in a short, crisp manner which almost explains itself (because of its ramming functions) even to a layman. Other names frequently used for this member are slide, slide bar, bar, mandrel, gate, head, plunger, &c. The last named word will be herein used for the inside ram of double action presses, the outside one being called simply a ram.

PRESS WORKING OF SHEET METALS.

Classification of Presses by Motion.

A strictly logical classification of presses seems impossible, as almost any given kind of press can be grouped by many different systems, some of which will inevitably interfere with and overlap each other. One important general distinction is that between single and double action—that is to say, between those having a plain ram with a simple

uniform motion, and two rams one inside the other, with perhaps different amounts of motion and moving at different times, as is the case with the ordinary drawing press. In some rare cases even more than two rams are used, but machines containing them may be justly ranked with special machinery, and need not be considered here.

Classification by Position.

Another conventional classification is by position. Whether a press is upright, as in Figs. 1 and 11, or inclined, as in Fig. 12, or horizontal, as would be the case if Fig. 1 was fastened with its base against a vertical wall, determined its position and perhaps one of its names. In Figs. 11 and 12 is shown a common form of press where the frame can be set at any desired angle between the two extremes shown by swinging, rocking or otherwise revolving it, in relation to its legs. Such presses are usually called "inclinable," in distinction from the term "inclined," in which latter case the frame is supposed to be permanently fastened in such position. The object of this inclination is that work which is knocked up from the lower die, and delivered between it and the upper die, may slide away from said dies by the force of gravity, usually passing through a hole, *h*, indicated by the dotted lines, and thence descending into a proper receptacle.

Classification by Frame.

Another classification is by the kind of frame used, of which there are many types. The most common among these is the throated frame shown in side view in Figs. 1, 11, 12 and 13, where the throat measurement is counted from the axis *a* of the ram backward to the front surface of the frame, as at the dimension measurement *t*, and is usually expressed in inches Such presses are usually cast with the frame in one piece. The general form is obviously that of a parabolic beam bent somewhat into the shape of the letter C. Such a beam, of course, has its ends of much less depth than its middle portion, according to the well-known laws governing the strength of beams when so constructed as to put equal stress upon the material at all points in their lengths. The ideal outside contour for such a beam is approximately shown by the dotted line in Figs. 1 and 13, which starts at *m* and ends at *n*. The parts of the frame exterior to this line are added at the bottom to give a flat base and at the top to give ram bearings, but the parts necessary for strength lie within said dotted line. In Figs. 3 and 4 are shown cross sections of the back part of the press frame cut at *w x* or at *y z*, where the tensile member *q* is connected with the compressive member *r* by two thin webs at the sides, or one web in the middle, as the case may be. Figs. 3 and 4 are equally good as regards the normal vertical strains of the press, but Fig. 3 has the well-known advantage of any tubular construction in regard to torsional strains, and is, therefore, better for a press frame, as there is less chance of the ram bearings springing sidewise. In both figures the member *q* is shown much heavier than the member *r*, because the usual material, cast iron, is supposed to be employed, and this metal has a tensile strength much less than its compressive. In Fig 5 is shown a cross section sometimes used where there is evidently a considerable waste of material, both in the middle, *s*, and at the back, *r*. In Fig. 6 another section sometimes used is shown. The relation of *q* and *r* is correct, but there is waste material at *s* In some cases press frames of the general C shaped type in question are made with the projecting bed detachable, and perhaps adjustable up and down. Witness an ordinary horn press, where the horn really

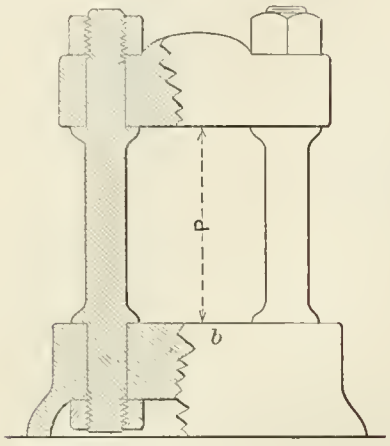

Fig. 14.

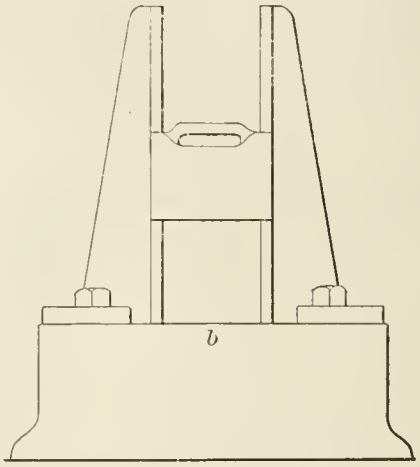

Fig. 22.

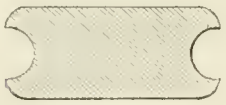

Fig. 20.

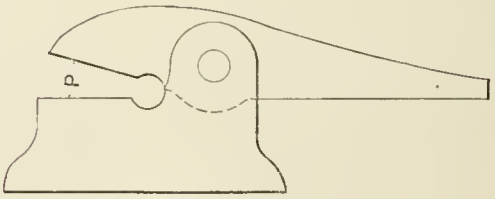

Fig. 23.

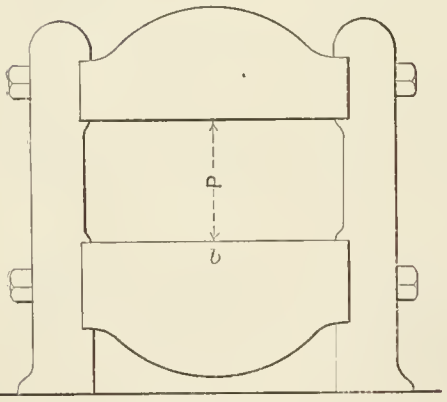

Fig 21.

Fig. 24.

PRESS WORKING OF SHEET METALS.

constitutes the bed, but is interchangeable with other horns.

Perhaps the next most common form of press frame is shown in front view by Fig. 7 and in top view by Fig. 8, where the bed is connected to the ram bearings by two vertical posts or columns, forming a part of the same casting. In these figures a form often used for screw presses is shown, but the same general construction is more often embodied in much taller and narrower presses, which are frequently run by power and used for embossing, punching, &c., particularly in cases where there is no need for passing through a wide sheet of metal, as is done in throated presses. In Fig. 13 is shown a common type of press frame with an exceptionally deep throat, which is used especially for heavy punching and shearing work.

It is evident that in Fig. 7 the frame F consists essentially of a double ended beam forming the bed, connected to another double ended beam across the top by the two upright columns, which are subjected to tensile strains mostly. Any shape of cross section is, therefore, suitable for columns of this kind, the most common forms being those shown in Figs. 9 and 10.

Composite Frames.

Besides the numerous family of seamless press frames there are a variety of composite constructions in which the frame proper is built up of several pieces. Among these a common form, which may be called a pillar press, is shown in partial front section in Fig. 14. In this case a heavy cross beam forming the bed, and usually also the base of the machine, is connected to the cross beam at the top by two or more cylindrical columns or pillars, which are usually turned and accurately fitted to bored holes in the aforementioned beams, being held securely therein by large nuts screwed on at the top and bottom ends thereof. This is a common construction in hydraulic presses, and also in ordinary power presses of very large size. No attempt has been made in the cut to show the ram or its driving mechanism. It will be noticed that the pillars of this press are subjected to tensile stresses only and that it is of a convenient form for cheaply making these members of forged metal, which, of course, makes them much safer against breakage. A design of this kind always strikes the observer as being more architectural in its nature than the forms previously described, as we have here some of the prominent elements of a Greek temple —the stylobate, the columns with base and capital and the entablature being clearly discernible. Its structural principle, however, is evidently very different from the temple in question, the stresses upon whose columns are purely compressive.

Another composite form of press frame is shown in Fig. 21, where the columns are usually of cast metal and where the cross beams forming the bed and what, for want of a better name, we will call the head, are notched into the columns and secured therein by heavy bolts from the outside. The stresses upon these columns are largely tensile, but strongly approach lateral stresses at the points of junction with the cross members.

Still another form of frame is shown in Figs. 22 and 24, where the portraits in front and partial top views, respectively, are of a somewhat corpulent member of the genus drop press, the ram being shown half way up, but without its lifting devices. Such a method of fastening the columns to the bed is sometimes used in other than drop presses, but is not well calculated to resist tensile stresses. This feature is, however, of no importance in the case shown, where the ram falls by gravity and is not pushed downward from any part of the frame as an abutment. This same remark in regard to an upper frame not needing strength, except for ram guiding purposes when gravity actuates the ram, will, of course, also apply to such constructions as Figs. 1 and 7. In Fig. 23 is shown one of the forms of swinging ram previously referred to. In this way are built the well-known lever or alligator shears used in rolling mills, &c. The same principle is obviously employed in ordinary scissors, belt punches and other such tools. In one sense the ram may be said to form the upper arm of the frame. Numerous other frame constructions might be described, but the instances given will cover the majority of those in commercial use.

OBITUARY.

JAMES B. SCOTT.

James B. Scott, one of the most widely known citizens of Pittsburgh and throughout the entire State of Pennsylvania, and senior member of the firm of James B. Scott & Co., tin plate manufacturers, at Pittsburgh, died at his residence in Allegheny City, Pa., on Tuesday, February 13, at 3.30 p. m. The immediate cause of death was diabetes. Previous to the Johnstown flood Mr. Scott had a constitution of iron, but the exposure he underwent at the scene of the disaster, where as dictator he had supreme command of all that was done in dispensing relief and bringing order out of chaos, did much to take the temper out of that splendid constitution, and since that time the deceased had often known what it was to be subject to pains and ailments.

While Mr. Scott was always a successful business man, having amassed quite a large fortune, it was as a public spirited citizen that he was best known. For several years past he has been a member of the State Board of Charities and of the Committee on Lunacy of that board, and in the matter of devoting time and careful, painstaking attention to the important work with which he and his fellow members were charged, he was most generous. It was only last August when Mr. Scott, worn out by the cares of business and being in poor health, having only a few months before been confined to his house for several weeks by a blood trouble, was urged to take a vacation. He took one of three weeks, but spent the entire time traveling through the upper tier of counties, inspecting jails, almshouses and other institutions, county and State, coming within the scope of public charities.

In answer to suggestions that he was devoting too much time to the State, his answer always was that the unfortunate charges of the State received too little attention as it was, and that if it lay in his power to do anything toward relieving their distress or bringing about their reformation he would be amply repaid for all his time and trouble. It was this same spirit that made him among the first to answer the cry of distress from the Valley of the Conemaugh in 1889. He sacrificed his business and his health at that time.

By common consent he was made "Dictator," with all the powers that the term implies, and there he worked with a rare business and executive ability, an indomitable energy and an unselfish charity till a semblance of order had been brought about. It was he who sent back to Pittsburgh an appeal to his business associates that loosened purse strings as they had never been before.

Mr. Scott came home from Johnstown a very sick man. Eventually kidney troubles resulted and would not be shaken off.

Mr. Scott was chairman of the Pittsburgh Relief Committee, formed at the time of the Johnstown flood and was chairman of a like committee at the time of the Oil City and Titusville disaster. For nearly a score of years past he had a leading part in every public undertaking up to the time of the forming of the committee of citizens to arrange for the holding of the next National Encampment Grand Army of the Republic This was last fall and Mr. Scott was urged to take an important office, but much to the regret of all he refused, feeling that his health would not permit of it.

Mr. Scott was one of the vice-presidents of the Chamber of Commerce; a director in the Real Estate Savings Bank; was formerly chairman of the Board of Trustees of the Western University and was prominent in getting the institution established in its present quarters; he was at one time a trustee of the West Penn Hospital and was a vice-president of the Pittsburgh Library Association.

Andrew Carnegie, recognizing Mr. Scott's talents, called him to his aid as chairman of the Carnegie Library Commission of Allegheny, and again as chairman of the commission that has in charge the erection of the Carnegie Library, Music Hall and Art Gallery at Schenley Park.

Mr. Scott was essentially a self-made man. He was born on February 20, 1839, in a house on Third avenue, near Ferry street, Pittsburgh. His father was a contractor. Deceased left the public school he attended to go into the employ of Park, McCurdy & Co., at the same place where Mr. Scott's business house now stands. He continued with the firm till he had purchased an interest, and finally his name appeared at the head of it. He was married in 1867 to Anna W. Jacobus, daughter of Rev. M. W. Jacobus, at that time of the Western Theological Seminary faculty. Five children, a son and four daughters, were born, and all, with the wife, are living.

Two of the daughters were attending school at Farmington, Conn., but reached home late Monday night, just in time to be recognized by their father before he passed into a state of unconsciousness that continued until death claimed him. Until the Wednesday before his death Mr. Scott was attending to his business. His sickness rapidly grew worse and by Sunday there was little doubt that it was his last.

In church work the deceased was as active as in matters of public life and importance. The funeral took place at 2 o'clock Thursday afternoon.

Thomas Sands of Nashua, N. H., is putting on the market galvanizing kettles which are welded instead of being riveted. The body is made of one piece and the rim is strengthened by a heavy steel bar. All danger of breaking is thus avoided.

ROOFING AND CORNICE.

Home Made Wrench for Cornice Makers.

From W. N., *New York City.*—I present herewith for the benefit of the cornice maker and all those who have bolting to do, what we call in the shop a pipe wrench, for fastening the bolts when putting wrought iron braces in cornice work. When fastening bolts in cornice work it is usual to employ a wrench or flat pliers, but as this is very slow work, and the bolts used in cornice work are all of one size, the following diagrams and description will show how to make from a piece of iron pipe square end of the finished pipe, shown in Fig 3. It should be understood that the size of the nut at once gives us the size of the inside diameter of the pipe required. If, for instance, a ½-inch bolt carried a nut of 1 inch square, the size of the pipe should be 1 inch inside diameter. The size of the rod in Fig. 2 tapers from 1 inch to ¼ inch, thus indicating that pipe wrenches from ¼ inch to 1 inch square can be made thereon. If a larger size wrench is required it would only be necessary to use a larger size rod. In Fig. 3 is shown a finished view of a home made wrench. and if so desired the one end, A, can be

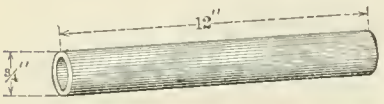

Fig. 1.—Iron Pipe Required.

Fig. 3.—Finished Wrench.

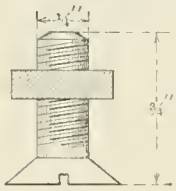

Fig. 4.—Full Size Bolt for Fastening Braces.

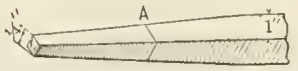

Fig. 2.—Forged Tapering Rod.

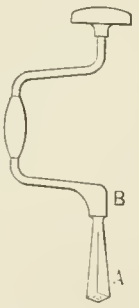

Fig. 6.—Showing How Device Can be Used in a Brace.

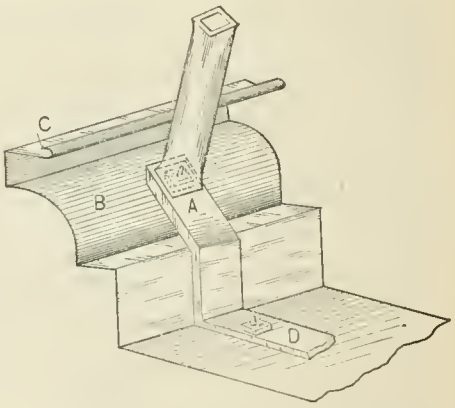

Fig. 5.—Illustrating Method of Using Wrench.

HOME MADE WRENCH FOR CORNICE MAKERS

a home made wrench that is simple and inexpensive, while saving a great amount of time and labor, as proven by actual experience to the writer. Referring to the diagrams, let Fig. 1 represent the piece of gas or steam pipe required, in length about 12 inches or as long as desired, being ½ inch inside diameter and ¾ inch outside diameter, as shown in Fig. 1. Let Fig. 2 represent a forged tapering square rod, forged from a 1-inch square rod, tapering to ¼ inch square, as shown in Fig. 2 In fastening braces in cornice work ½ inch thick bolts are usually employed, and the nuts measure ½ x ½ inch. Then, for making a pipe wrench to fit nuts for ½ inch bolts, proceed as follows: Fasten the square tapering rod, shown in Fig. 2, in a vise, and make a mark on the square rod which will indicate the ½-inch width required for the nut of a ½ inch bolt, as shown at A in Fig. 2. Now heat one or two ends of the pipe to a red heat and pressing the heated pipe over the tapering rod, strike with the hammer alternately until the pipe comes to the ½ inch mark, shown by A in Fig. 2. It may be necessary to heat the pipe a second time. A nut of the bolts which are to be used is now fitted into the made to fit one size nuts and the other end, B, to fit another. But, as, cornice makers use only ½-inch bolts, the full size bolt being shown in Fig. 4, it is better to make the two ends A and B in Fig 3 suitable for this size. B in Fig. 5 represents a piece of cornice with the lock C attached, and the brace A D is shown bolted in position; after the bolts are passed through the brace the nut is turned on the bolt as far as it will go by using the thumb and finger; then, placing the pipe wrench over the nut, as is shown in Fig. 5, and grasping the wrench firmly with two hands, turn the pipe quickly until the nuts are drawn tight. In using an ordinary wrench or pliers a continuous screwing of the nut is not possible when the nuts are in the positions shown by A and D in Fig. 5, but they can be fastened easily with the wrench shown in Fig. 5. Fig 6 shows a carpenters' brace fitted with a pipe wrench forged tapering at A, so as to fit into the socket of the brace, as shown at B. Thus when a number of braces are put into a cornice the nuts are all fastened as far as possible with the fingers; then, using the brace and wrench shown in Fig. 6, the nuts are all tightened at one time.

FLASHINGS.

It is reported that G. B Eggleston has purchased of Mrs. J. K. Klugel the machinery, tools and good will of the Klugel Cornice Works, on Main street, Danville, Ill.

To the Montross Metal Shingle Company, Camden, N. J., we are indebted for an attractive calendar that they distribute to the trade. It is a large card decorated with a view of a residence in Delair, N. J., the second story and roof of which are covered with metal tile shingles made by the Montross Company. The calendar proper is a dozen leaflets attached to the bottom of the card and at the sides of the calendar are engravings of the Gothic tile, Eastlake shingle, Diamond tile and the Octagon shingle.

Proudman Bros., successors to H. B. Todd, Meriden, Conn., have removed from 49 South Second street to 108 Miller street, where they will continue the manufacture of light metal goods, including the Yankee eave trough hangers. under more favorable conditions than heretofore. Their entire plant is now on one floor and much better arranged for economical production.

The S. E. Barrett Mfg. Company, makers of roofing material, will move about May 1 from 68-74 La Salle street, Chicago, to the new Stock Exchange building, Dearborn and Washington streets.

George Camenisch, La Salle, Ill., has purchased the cornice and roofing business of D. C. Harr, the latter keeping the plumbing part of his trade.

J. S. Thorn of 1227 Callowhill street, Philadelphia, galvanized iron and copper cornice and sheet metal work manufacturer, has issued to his

friends a handy little vest pocket "reminder" or calendar especially suitable for business men. Besides ample space for daily memoranda, the book contains some valuable tables and other interesting matter, among which may be mentioned a list of antidotes for poisons and directions for treatment of patients until a doctor can be obtained; also a form of identification of the owner of the book, which, when filled up, completes a record of those measurements and peculiarities which serve as marks of distinction for the ordinary man. The book is nicely bound in a good quality of seal leather and will find a regular place in the pockets of those fortunate enough to receive it.

"From Quarry to Roof: A Practical Illustration of How Roofing Slate is Quarried, Made and Put On," are the headlines of a large poster which reaches us from the Slatington Bangor Slate Syndicate, Slatington, Pa. The poster is of heavy paper, bound at the top and bottom with heavy strips, and arranged with an eye for hanging it upon the wall. It is embellished with numerous illustrations, and descriptive text, calling attention to the varieties of slate turned out by the concern named. One picture represents a quarry pit, another a quarry bank, a third shows slate as split and dressed, another indicates its appearance stacked ready for shipment, while a fifth shows it being loaded on to cars. The central picture represents a dwelling the roof of which is being covered with slate. The seventh picture of the group is that of a blackboard factory. The poster states that while the principal office is in Slatington, Pa, the syndicate is represented in New York, Chicago, Cincinnati, St. Louis, New Orleans, Minneapolis, Omaha and Dallas.

Shop Rules.

We recently received an inquiry from a correspondent who wished information respecting shop rules as adopted by different firms. In response to a request sent to representative shops throughout the country we received a number of examples of the regulations adopted, a selection from which we take pleasure in presenting. In some of the large shops no printed system of regulations is enforced, the men simply being informed what the working hours are, and they are supposed to learn how to conduct themselves if they desire to be continued in the employment of the firm. Where used the regulations are either posted up around the shop or are given to the men as they enter the employ of the firm. As examples of the regulations adopted by some of the prominent shops we present the following:

The Mergenthaler Linotype Company, Brooklyn, N. Y.

REGULATIONS.

All employees of this company will be expected to carefully observe the following regulations, as they are considered a part of the contract with every person in our employ, and non-observance of them will be held sufficient cause for dismissal.

Employees will be furnished with a time check, which will be found on the check board at the entrance to the works, and each employee must deposit his or her check in the time-keeper's box on entering the works both morning and noon. No time will be allowed, under any circumstances, when checks are not so deposited. Checks must not be taken from the building, and no employee will be allowed to deposit any check but his own.

All employees who are not inside the gates within one minute after the last whistle will be considered late and lose one hour's time. This applies both morning and noon.

Employees who make a practice of coming late, either morning or noon, will be dismissed.

The hours of labor will be as given from time to time on the bulletin board at main entrance to the works.

Employees wishing to be absent will notify the foreman of their department, or desiring to leave during working hours, will obtain a pass and give same to the timekeeper at the door before leaving the works. In case of unexpected absence notice must be sent at once stating reason for such absence.

Loafing, frolicking or idling will not be allowed in the works.

Smoking or drinking intoxicating liquors will not be allowed in the works.

Employees will not be allowed to leave the department in which they are employed, except on business, during working hours.

Employees will not be called to the office except in case of necessity, nor allowed to take visitors into the works without permission from the superintendent.

Keep your bench in order and see that tools not in use are in their proper places and all machines clean and oiled.

Should you break a machine or tool report the same at once to your foreman that it may be replaced or repaired.

Employees will be paid every week and will be expected to sign a proper receipt for all moneys received.

The advancement of employees will depend entirely upon attention to business and the interests of the company.

Finally, all will be expected to obey the regulations cheerfully and strictly.

E. W. Bliss Company, Brooklyn, N. Y.

REGULATIONS.

Ten hours' labor shall constitute a day's work—viz., from 7 to 12 a.m. and from 12.30 to 5.30 p.m., except on Saturdays, when the works will close at 4 p.m.

All persons employed will be engaged by the hour. No time less than half an hour will be taken.

The blowing of the whistle will be the signal for closing the doors and the commencement and leaving off of work. No stopping of work or washing up can be allowed before the signal is given.

Hands desiring to be absent will make application to the foreman who supplies them with work, and when unexpectedly detained from work, notice must be sent immediately. Absence from works without permission or notice, as required above, will be considered as indifference to the employers' interest.

The pay roll will be made up every week, ending on Wednesday, and payment will be made the following Friday night.

Hands will not be called to the office except in cases of necessity, nor can they be permitted to take visitors into the works.

Unnecessary conversation, reading, whistling, smoking or frolicking are strictly prohibited in the works during working hours.

Each person employed will see that his bench and tools, and the machines used by him, are kept clean, and when in need of repairs report the same to his foreman. Special care will be expected from all to avoid injuring machines, defacing fixtures, breaking of glass, wasting of files, oil, waste, emery cloth and other stock.

These regulations are considered a part of the contract with every person employed in these works, therefore no one may complain of discharge for non-observance of them.

When industry, energy and economy characterize an employee he will merit and receive the confidence of his employers, and his interest will be advanced as opportunity presents.

Randolph & Clowes, Waterbury, Conn.

REGULATIONS.

1. All persons employed by this company are expected to attend strictly to their business, to observe decorum in language and behavior and stay in the rooms where they are employed; nor will they be allowed to lounge about or visit the other rooms during working hours.

2. All persons employed by this company will be held responsible for all damage that the company may sustain on account of their carelessness or neglect.

3. Ten hours shall constitute a day's work, being from 7 a.m. to 12 m., and from 1 p.m. to 6 p.m.; and all employees must begin and stop work with the whistle. No employee will be allowed to wash or prepare to leave work before the whistle blows.

4. The engine will stop on Saturday night at 5 p.m. from June 1 to September 1, and at 5.30 p.m. from September 1 to June 1, to allow time for cleaning, and every employee will be required to clean up before leaving.

5. Employees desiring to be absent must make application to the foreman of the department where they are employed. When unexpectedly detained from work notice must be sent immediately. Absence from work without permission or notice will be considered indifference to the company's interests and treated accordingly

6. Employees will not be permitted under any circumstances to take visitors into the works.

7. No smoking will be allowed during working hours.

8. No person will be allowed to leave the works during working hours without a permit from his foreman, which permit must be left at the gatehouse.

9. The pay roll will be made up every Monday, and payment in full made every Tuesday, for all work performed up to and including the previous Saturday. Employees must immediately on receipt of pay envelope examine the contents, and should any error occur report the same immediately at the office. Advances will not be made between pay days.

10. The above regulations will be rigidly enforced, and each foreman will be held accountable for the strict enforcement of the same in his department.

The detrimental effects of the coal strike in England are apparent in the yearly returns of British coal exports, which were $10,800,000 less in value last year than those of 1892.

STEAM AND HOT WATER.

Radiator and Drip Connections.

BY HELIOS

Fig. 1 shows the manner of making connections from a riser to radiators where one riser is used to supply two radiators on the same floor, with the radiators on each side of a partition and with the branch connections to radiators taken from the riser at the ceiling below the floor the radiators are placed on. A cross is placed on the riser to receive the branch pipes to the radiator, the pipes being run as shown in Fig. 1. Place ceiling and floor plates as shown.

Fig. 2 shows the manner of making connections from a riser to radiators placed as shown in the illustration. The connections are taken from the riser beneath the floor. Place a cross in the riser and connect the branch pipes to the radiator as shown in Fig. 2. Crosses can only be used in very short risers, as no allowance can be made for the expansion of the piping. If crosses are used where there is considerable expansion in the piping the radiators will lift from the floor, and there is danger of the cross breaking.

Fig. 3 shows the manner of making connection to a radiator from the riser, with the connection from the riser to the radiator above the floor. The tee in the riser is set with the side opening out into the room. Screw into the tee a nipple and on to the nipple an ell, and then screw another nipple into this ell, with an ell on the end. Then screw a nipple into the corner radiator valve and screw the valve into the ell on branch connection. Place the tee in the riser close to the floor, and it will give a good drip back from the radiator to the riser. This connection can be used on any length of riser, as there is allowance for the expansion of the riser.

The same figure also shows return and drip connection taken from the end of the main steam supply pipe. In all steam work the main steam supply pipes must drip from the boiler. For small house work a drip and return pipe can be taken from the end of the main steam pipe, as shown in Fig. 3, and all branch pipes to the radiation on the first floor and all risers can drip back into the steam main. In large buildings it is best to take a drip pipe from the branch pipes to radiators and from the bottom of risers and connect to the main return pipe. Place automatic air valves on end of the steam main, as shown This valve will relieve the steam main of air and allow the air to enter the pipe when there is no steam on.

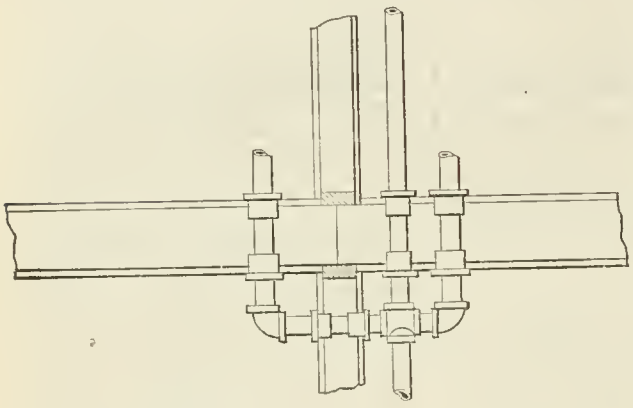

Fig. 1.—Radiator Connections from Ceiling Below.

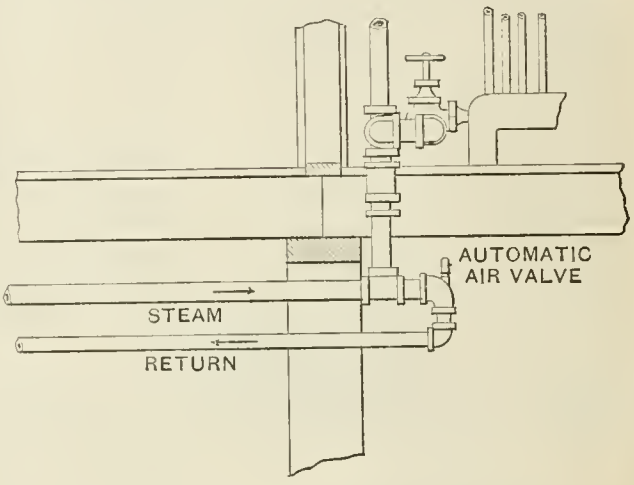

Fig. 3.—Radiator and Drip and Return Connections.

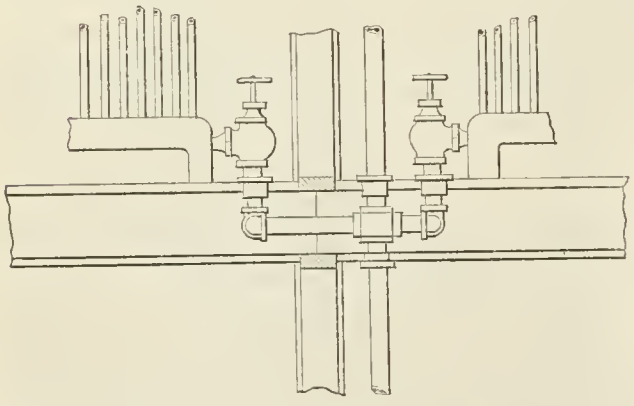

Fig. 2.—Radiator Connections from Beneath Floor.

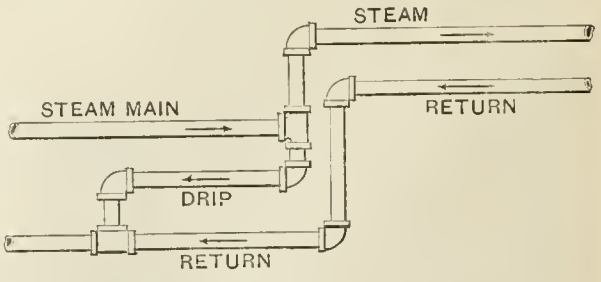

Fig. 4.—Main Steam and Return Drip Connections.

RADIATOR AND DRIP CONNECTIONS.

Fig. 4 shows a drip connection from the main steam pipe to the main return. This connection is used where there is a long line of steam pipe from the boiler. All main steam pipe must drop from the boiler not less than ½ inch in 10 feet, and if the cellar is low a fall of ½ inch in 10 feet will soon bring the steam pipe close to the water line in the boiler. By using this connection, as shown in Fig. 4, the steam main can again be raised to the ceiling and drip to the end. A steam main can be carried any length by making the connection shown in Fig. 4 as often as the steam pipe drops too low. A steam main can be run in this

way 500 feet from the boiler and the end will not be over 6 inches lower than at the boiler. In long lines of pipes do not reduce the size of the pipe, but keep it the same size throughout its entire length.

Warming and Ventilation.*—I.

It is now generally admitted that no system of ventilation is complete that does not provide at the same time for the warming of the incoming air, and that the warming of our public buildings must form part of any ventilation scheme; that, in short, in a well regulated system the ventilation and warming must be included in one scheme. In the following remarks the two will, therefore, always be considered together.

Essentials of any Good Warming and Ventilating Scheme.

A.—AS TO THE INCOMING AIR.

1. It must be fresh and pure.

For this purpose it must be possible to clean it by passing it through a filter or otherwise, and to moisten it, if required.

2. After having entered the building, the air must not be polluted again by being passed along dirty channels or ducts. All ducts, &c., should be constructed in such a manner as to admit of their being easily cleaned and limewashed for disinfecting purposes, if required. The heating surface must be such as to be readily cleaned.

3. It must be admitted into the room in its proper quantities.

4. It must be admitted with great regularity throughout the whole of the year.

5. Its velocity at entry must not be too high, so as to create either drafts or noise.

6. It ought to be made to enter the rooms either near the ceiling or near the floor, according to requirements.

As a general rule the air should enter the rooms near the ceiling and pass out near the floor level; but whenever the air above the heads of the people is considerably impurer than below—for instance, after the lighting of the gas, &c.—part, at any rate, of the air should be taken off at the top of the room.

7. It must be properly diffused, so that in no part of the room can the air remain stagnant. This should be done by properly arranging the inlets and outlets.

8. It should be warmed to the proper temperature and so maintained. This should not require an excessive amount of time in the morning.

9. It should be possible to quickly raise or lower the temperature of a particular room without interfering with any other room, without materially decreasing the volume of air supplied.

10. It should be possible to cool the air in hot weather. Owing to the cost of this process, however, it is not frequently adopted. To lower the temperature of a hall containing 1000 people from 80° to 70° F., with an allowance of 2000 cubic feet per head per hour, requires about 1 ton of ice per hour.

B.—AS TO THE OUTGOING AIR.

11. It should leave the room either near the floor or near the ceiling, according to requirements.

12. It should leave the room in sufficient quantities so as to make room for the fresh air.

13. It should leave the room with great regularity throughout the whole of the year.

14. Its velocity at exit should not be too high, so as to cause either drafts or noise.

15. The vitiated air from one room must not be allowed to enter another room through back or down drafts. The outlets into the outer air must be so arranged that this is impossible.

16. The vitiated air of a room containing fever germs should be sterilized by being passed through a higher temperature, such as the heat of a furnace, &c.

C.—AS TO THE WORKING OF THE SCHEME.

17. The machinery for dealing with the warming and ventilation should be arranged in such a way as to be easily manipulated by the man in charge without undue trouble, and, if possible, without entering the rooms, and he should be responsible for maintaining and controlling the temperature.

18. The arrangements should be fairly simple, so as to be readily understood.

19. The cost of the scheme should not be excessive either in first cost or in annual working expenses.

Ventilation by Natural Means.

Sir Henry Roscoe sums up these advantages in the case of schools as follows:

1. "Because it is more comfortable, the rooms being kept warmer, the temperature being more uniform and more equally distributed, while drafts are as far as possible avoided."

2. "Because it is much healthier and diminishes the risk of the spread of infectious disease, owing to the rooms being supplied with purer air."

3. "Because the children by it are enabled to derive greater benefit from their education."

4. "Because it increases their grant earning power without increasing the labor of earning the grant."

5. "Because it lessons the labor and increases the teaching power of the teacher."

The author would here remark that under the term "ventilation by natural means," "natural ventilation," or "automatic ventilation," he comprises all those methods of ventilation which rely solely on the difference of temperature and the state of the atmosphere as the moving power, and in which no provision is made for increasing the temperature of the outgoing air, so as to create a powerful upcast movement; and under the term of "artifical ventilation by mechanical means," or "mechanical ventilation," he classes all those systems in which either special arrangements have been made to heat the outgoing air, or in which a distinct motive power (steam, gas, electricity, &c.) is employed for driving machinery, which either propels or extracts the air.

Ventilation by Mechanical Means.

The mechanical systems of ventilation now in use may be broadly subdivided into two classes; one in which the extraction of the polluted air courses, by the establishment of a partial vacuum and the inrush of fresh air; the other in which the fresh air enters the room under a slight pressure, thus forcing the foul air before it. The former method is called the "extraction, aspiration or vacuum system," and the latter the "propulsion, impulsion or plenum system." In their practical application these methods are not always kept strictly apart, but frequently a combination of the two is employed, according to the circumstances of the particular case.

As to the value of these systems, it would be altogether wrong to suppose that one special method is or can be applicable to all buildings; and if it were tried to establish one and the same principle in every building one is called upon to ventilate some failures would inevitably result, good as this particular system might be. The author would, therefore, most strongly emphasize this point: that an engineer designing the warming and ventilating arrangements of a building, in order to be successful in his designs, must on no account be bound down to any particular system, but must be allowed to adopt his scheme to the requirements of each building he is entrusted with. A description was then given of the different methods of ventilating on the exhaust plan with a statement that:

The more important points of difference are as follows:

1. As to the purity of the incoming air.—In the vacuum system, it is difficult to say with certainty from which place the fresh air is taken. On the air in the room being extracted a partial vacuum is established, which is filled by air rushing in from all sides, that place supplying most where the resistance to the passage of the air is smallest. If a drain, sewer, soil pipe or water closet happens to be near, polluted air from either of these sources may get drawn in without filtration.

2. As to drafts.—The chances of drafts through the inrush of cold air are considerable in this method.

3. As to the diffusion of the incoming air.—It is difficult to obtain perfect diffusion with this system, as the air entering the room to supply the partial vacuum will frequently rush at once across it to the outlet opening through which the fan is pulling it, leaving the vitiated air unaffected.

4. Extraction tower system with heat.—In any system as employed at the Medway Street Board School, Leicester, the difficulty is to get the extraction flues large enough to extract enough air during the summer months, when the heating of the building is discontinued and the temperature difference inside and outside the tower not large enough to set up a powerful extraction action.

5. Numerous inlets of fresh air supplied with filters.—In any scheme where the fresh air is allowed to enter the building through numerous openings at which it is filtered, the difficulties of properly regulating the air supply are greatly increased, owing to the great number of filters requiring constant attention.

6. Controlling the temperature of the rooms.—In a scheme in which the heating surface is placed in the rooms themselves, the regulation of the temperature must almost of necessity pass out of the hands of the man in charge, which those who have under their supervision know is a distinct failing.

(*To be concluded.*)

* Paper read by Mr. Ashwell before the British Association for the Advancement of Science.

MESSRS. GILLETT AND JUDD, Aurora, Ill., have sold their interest in the plumbing business to Messrs. Johnson and Walters of the Aurora Steam Heating Company, and the firm will now be known as Lake, Johnson & Walters, their place of business being at 36 Fox street.

The Master Fitters' Association.

We are requested by Secretary Reynolds of the Master Steam and Hot Water Fitters' Association of the United States, whose office is at room 625 Metropolitan Life Building, Madison avenue and Twenty-third street, New York, to publish the following announcement:

The Executive Committee of the Master Steam and Hot Water Fitters' Association of the United States have decided to hold their coming annual meeting at the Broadway Central Hotel, on Broadway, near Third street, New York City, on the 19th, 20 h and 21st days of June next. Mr. Tilly Haynes, whose name is so familiar to the public as a successful hotel man, is proprietor of the Broadway Central, and we have his assurance that all will be properly looked after and fairly treated on this occasion. Rates, "American plan," will be from $2.50 to $4 per day, the reduction being that their usual $3 per day accommodations will be at the $2.50 rate; $3 50 at $3; $4 at $3 50 and $5 at $4 per day. On arrival of guests special and satisfactory arrangements can be made on the European plan, if any so desire. The appointments at the Broadway Central are specially favorable to those who may desire to exhibit goods during the convention. Full particulars regarding this feature can be had and arrangements made by addressing the hotel people direct.

Radiator on Boiler Level.

From A. C. Edgar, *Philadelphia.*—In *The Metal Worker* of Feoruary 10, "J. W. H." wrestles with difficulties that are only imaginary. He objects to the sketch recommended in the issue of January 27 because there appears to be no provision made for the pipe expansion. This is a subject that the practical pipe fitter is so well acquainted with that he would not attempt to make connections without allowing for expansion, even though not shown on sketch. He compares the recommended method with the independent main and does not consider it good practice to connect radiators on different levels with the same supply. It may be customary in the city that is truthfully called "the home of modern hot water heating" to run separate mains for radiators on different levels, but it would not be considered good practice here; in fact, would seldom be allowed in a seven or eight story building, where the several mains would be an unnecessary disfigurement to finished apartments in the basement. A trunk main properly reduced where branches are taken off will heat all radiators evenly and at the same time, even when mild firing is required. The plan recommended was not to dispense with syphon and independent mains entirely, but simply a means of obtaining the desired results where either of the former would be inconvenient. The difference in temperature between the upper and lower radiators will be no greater when connected as recommended than it would be if connected with syphon or independent main. Practical application has proven the foregoing to be correct when the supply to upper radiator is large enough. Let the "sharpening process" recommended by "J. W. H." continue.

HEATING NOTES.

Master Steam and Hot Water Fitters' Association of the United States, through their Executive Committee, are issuing an address to the members of the trade throughout the country, calling attention to the advantages that are to be obtained by membership in the association. They inclose blanks for membership applications, and request that communications be sent to Secretary Reynolds, Room 625 Metropolitan Life Building, New York City.

The American House Heater is the name of the hot water apparatus made by the Whitlock Coil Pipe Company, Elmwood, Conn., that has been used recently in a number of New England contracts.

The Hoffman-Russell Company have been formed, with a capital of $25,000, and will conduct a general heating business at 82 Lake street, Chicago, They are agents for the Economy heaters, Brownson improved boilers and the Weston engines. The officers of the company are as follows: Geo. D. Hoffman, president; J. E. Russell, vice-president and manager; B. L. Engelke, secretary and treasurer.

The New York Exhaust & Blow Pipe Company, 26 to 30 Mechanic street, Hartford, Conn., made all of the sheet iron work for the heating plant in the Opera House at Middletown, Conn., and for the exhaust plants in the wood working mills of G. Elias & Bro., Buffalo, N. Y., and the Chas. Parker Company, at Yalesville, Conn. They make a specialty of erecting ventilating plants to be used in connection with fans.

Specially interesting to Western readers is a new publication entitled "A Few Voluntary Testimonials" concerning the operation of Mott's Sunray water heaters, received from various points in the West, and issued by the J. L. Mott Iron Works, 311 and 313 Wabash avenue, Chicago, and 84 to 90 Beekman street, New York. In this work, which comprises 24 pages, are given exact reproductions of commendatory letters received by the firm named from a variety of persons at different points in the West, comprising architects, plumbers, steam fitters and consumers. It is gratifying to read what a man says in his own handwriting, and the burden of these letters must be particularly gratifying to the firm, as they are so warmly eulogistic. In addition to the letters some sectional plates are presented to show the internal construction of the Sunray and tables are given of sizes and dimensions. The work is beautifully printed and is bound in a neat paper cover.

St. Joseph, Mo., will probably be heated by steam from a central supply station. This is to be done by the company operating the electric street car lines under the name of the St. Joseph Traction & Lighting Company. The project has been considered for a long time, but has only recently taken practical shape.

The Windsor Heater Company of Galena, Ill., issue a 24-page catalogue descriptive of their hot water heater. A chapter on the advantages of heating with hot water forms an appropriate introduction to the work. Then follows an elaborate treatise on the Windsor system. This heater is constructed of vertical tubes, which completely surround the combustion chamber and extend to the bottom of it. Cast iron annular water chambers are placed at the bottom and top of the heater, but externally, so that cast iron parts do not come in contact with the fire. The company manufacture their own radiators, which are made of horizontal tubes fitted up in either plain or ornamental finish, and can be made of any hight, length or shape to fit corners or curves. These radiators are constructed of ¼-inch pipe, so as to secure increased radiating surface by the finer subdivision of the water. Ten sizes of heaters are made, of which the odd numbers are adapted to soft coal and the even numbers to hard coal. The table giving dimensions and capacities of these heaters states the approximate cubic feet of space each size is intended to heat, in addition to giving the usual information as to square feet of radiation which it is calculated to carry. The catalogue concludes with a number of testimonials from those who have used the Windsor heater in their dwellings.

B. E Mallory of Norwich, Conn., and Geo. W. Clark of Newark, N. J., were at the plumbers' convention at Hartford, Conn., talking steam and hot water and representing the Richmond Stove Company, Norwich, Conn.

"Exporters' Hand-Book of Mexico" is the title of a 64 page book published by Philip G. Roeder, 664 Cedar avenue, Cleveland, Ohio, and Calle de la Palma No. 2, Mexico City, Mexico. The compiler has spent several years in traveling through the Republic, and the list of towns, with the leading banks, hotels and dealers in all kinds of goods, was made for his own convenience. It gives some Spanish business terms and their English translations, and special stress is laid upon the necessity of carrying out literally and in detail all instructions in reference to packing and shipping goods that are given with order.

The *Journal du Gaz et de l'Electricité* says that to keep flies from injuring picture frames or other articles, it is a good plan to paint them over, with a soft brush, with the liquid obtained by boiling three or four onions in a pint of water. The flies dislike this and will not approach any article so coated.

President C. P. Huntington of the Southern Pacific Railroad has approved the plans and signed a contract with the Phœnixville Bridge Company for the construction of a new bridge for the company's line over the Mississippi near New Orleans The bridge, which will cost $5 000,000, will be 10,500 feet long, with a double track. It will be built on the cantilever principle, and will be one of the largest bridges in existence. The object in its construction is to give the Southern Pacific an all rail entrance into New Orleans.

Cotton seed oil will now be shipped in bulk, like petroleum, on ocean steamships. The pioneer vessel for this new commercial departure was lately launched at Port Glasgow for the American Cottonseed Oil Company. The new ship, named the "Aco," is 345 feet long, 43 feet beam and 22½ feet depth of hold, and is built throughout of steel. She is so designed that she can carry either a liquid or general cargo, or both at the same time. There will be room for 500,000 gallons of oil in her holds besides about 1000 tons of general cargo.

PLUMBING and GAS FITTING.

New York State Plumbers.

The Master Plumbers' Association of the State of New York will hold its annual convention in Buffalo, N. Y., on March 6, 7 and 8 next, with headquarters at the Tifft House. About 200 delegates are expected.

The local association of master plumbers, headed by Charles Geiger of Barnes & Geiger, who is the present president of the State Association, is making extensive arrangements for the entertainment of the visitors during their stay.

The master plumbers will go in a body to the Builders' Exchange on the morning of the 6th, where they will be received by the master builders. Mayor Bishop will deliver an address of welcome, which will be responded to by President Geiger. In the afternoon the regular business sessions of the association will begin at Metropolitan Hall. The Committee on Entertainment has arranged for a carriage drive around the city, a theater party and other amusements. On one of the evenings a reception will be given the delegates at the parlors of the exempt firemen on Pearl street, and possibly a banquet may be added to the programme for one of the evenings.

Domestic Electrical Work.*—XI.

By W. A. W.

Running Wires in Finished Buildings.

To become an expert at running wires in buildings already finished it is necessary to study closely the general construction of buildings. It is very essential to be able to determine beforehand where and what sort of obstructions we are likely to encounter in attempting to wire a building, and perhaps nowhere else has the electrician a better opportunity for the display of skill and ingenuity than in wiring an old house and leaving scarcely a trace of his work behind him. It seems at times a very difficult matter indeed to get a certain wire into a certain place without tearing up floors or disfiguring the wood work of a house, but by the exercise of a little patience and perseverance it can usually be accomplished.

We will begin with an ordinary door bell and let the push button be placed on the door. This is not usually the case, but is sometimes required. It frequently happens that an old fashioned door bell is taken off to make room for an electric bell, but in doing this an ugly looking hole is left in the door, which must be covered up some way, and we naturally look to the electric push button as the most suitable thing to help us out. The neatest way of wiring a door is to bore a ¼-inch hole from the hinge side into the door until it intersects with the hole left by the old bell. With a floor groover cut a groove on the edge from the hole just bored to the lower hinge and another to the upper hinge. It is best to remove the door from its hinges, take off the hinges and file bright on the back side around one of the screw holes. Bare the end of the wire and lay a few turns of it so that it will come in contact with the spot filed bright and around one of the screws. Lay the wires along the grooves on the edge of the door, driving a staple every 5 or 6 inches. Be sure to drive these deep enough so that none will project to interfere with the closing of the door. Run the wires to the push button through the ¼-inch hole previously bored and connect in the usual manner.

Proceed in like manner for the parts of hinges and door frame. Bore ⅝ inch holes from back of these through the door frame until the open space back of the plastering is reached. The drop line, with piece of chain or lead weight attached, should be lowered from the upper hole, and with a piece of wire, with a small hook at the end, enough of the line should be fished through the lower hole to permit another piece of line to be tied to it. To the ends of these lines the wires must be fastened. By driving a wire finishing nail through the floor alongside of door frame we can easily locate the spot from below. From here a ½-inch hole should be bored diagonally through the sill, so that it will come out in the space behind the plastering. Through this hole the drop line, with wires attached, must be fished. The bell, which should be placed against a partition, presents less difficulty in wiring; it is only necessary to bore a hole where the bell is to be located, put in the drop line, drive a nail as before, to locate the place, bore a hole from below and fish it out. This makes a very neat job if properly executed. The hinges of the door acting as a part of the conducting wire leaves the door free to be taken down and also obviates the unsightly slack wire running from door to frame.

Where a job requires a general wiring, such as gas lighting or annunciator work, the building must be well studied before starting out, so as to avoid as much as possible all serious obstructions. The first story of a building seldom presents any serious difficulties in wiring. In a two-story building it is usually found much easier to run a wire from the cellar to the garret, where we are generally permitted to work with hammer and tongs, as there is nothing to disfigure, and it is an easy matter to branch off to the various fixtures and drop down from above. Where it is necessary to run wires between ceiling and floor the circuit, if possible, should be so arranged that these wires will run parallel with the joist. A small hole just large enough to let the drop line through should be bored so as to reach into the partition below. Let the drop line down and fish out in the cellar, attach the wire to this and draw it up. Drop part of the line back into the hole again.

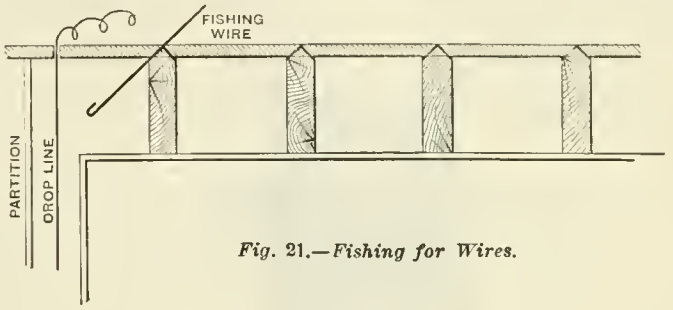

Fig. 21.—Fishing for Wires.

Next bore a hole through the floor in the direction in which the wire is to run and as far from the first hole as can conveniently be reached with a fishing wire and draw the line through here, and so on until the fixture is reached. All holes should afterward be neatly plugged up, giving the plugs a coat of shellac varnish before driving in to prevent them coming out. Where, for fishing purposes, holes are bored through plastered walls that are papered, three sides of a small square

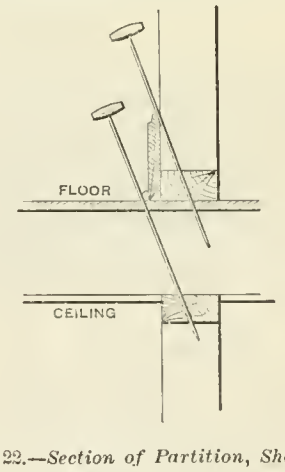

Fig. 22.—Section of Partition, Showing Method of Wiring.

should be cut in the paper and the paper dampened a little so that it can be loosened and turned back. When done the hole should be filled with plaster of paris and the paper pasted back, thus obliterating all traces of the work done.

In lightly built houses it is often found easier to take off the baseboard molding and run the wires under it. Care should be taken, however, to break off all old nails, as any attempt to drive them back would be almost certain to injure the molding.

*Copyrighted, 1893, by David Williams.

When it is necessary to run wires between floor and ceiling crosswise to the joist, the first thing to do is to locate their centers. From the centers bore ¼-inch holes each way in the form of an inverted V, and work from one joist to the next with drop line and fishing wire, as shown in Fig. 21.

In old houses where partitions are directly under each other it is an easy matter sometimes to drop a line from garret to cellar. In the modern house, however, it is not such a simple job, as we usually find a 2 x 4 plate on top of the studding underneath the joist, and another 2 x 4 sill on top of the floor on which the upper partition studding rest. In Fig. 22 is shown a method of passing obstructions of this nature. The obstructions met within a finished building are of such great variety that space will not permit of a description, or even mention of them all. But enough has been shown and described to indicate the general plan adopted for doing this kind of work, and by exercising a little ingenuity no serious difficulty should be experienced in reaching almost any part of a house with a wire. Where wires are run exposed on baseboards, door or window casing they should be drawn taut and well stapled, and last, but not least, never, under any circumstances, run more than one wire under a staple; it is dangerous practice and is sure to cause trouble sooner or later.

[THE END.]

Eureka Smoke Testing Machine.

Eureka Smoke Testing Machine.

A device of interest to the plumbing trade has just been brought out by the Bailey-Farrell Mfg. Company, Pittsburgh, Pa. The machine, which we show in the accompanying illustration, is designed for testing the soil and sewer systems of houses just completed; also for detecting leaks in old soil and sewer systems. When the machine is in operation the smoke in the pipes has a pressure of ½ ounce per square inch or more, as desired, which is sufficient to fill the entire system with smoke without forcing the water from the traps. The pressure of the smoke is indicated by the small water gauge shown at the left of the engraving, which when the machine is not in use can be detached to prevent being broken. It is described as being as convenient for carrying as a plumber's furnace, weighing less than 15 pounds, and very simple in operation. To prepare for use the loose cylinder is removed and a small quantity of water poured in the outside chamber. In the fire pot, in the inside chamber, is placed a piece of greasy waste, which being ignited produces a dense smoke. Replace the cylinder and move it up and down and a dense volume of smoke is given off. The Bailey-Farrell Mfg. Company, in directing the attention of plumbers, inspectors and boards of health to this device, describe it in the following way: "The Eureka smoke testing machine was originated and invented at the urgent request of the Plumbing Inspector of the city of Pittsburgh, for a simple and efficient tool that would enable the plumber to apply the penetrating smoke test and by it prove his work perfect. This tool enables the official inspector to certify with confidence that a sewer system in a modern dwelling is beyond doubt in a sanitary condition, thus relieving the plumber from responsibility, and giving to the occupant of the dwelling that confidence in the sanitary condition of his plumbing appliances not otherwise attainable."

A Plumber's Card.

During the agitation in England over the pending Plumbers' Registration bill the following bit of oddity and sarcasm was sent to the London *Ironmonger:*

GOOD DRAINAGE IS CONDUCIVE TO HEALTH!

Have your

DRAINS AND SANITARY FITTINGS

Tested by a thoroughly

PRACTICAL REGISTERED PLUMBER.

DO not entrust such important work to the Botch Men, who have the audacity to style themselves Sanitary Engineer, Chimney Sweeper, Scissor Grinder, Cobbler, Grave Digger, Undertaker, Plasterer, Cabinet Maker, Stove and Range Fitter, Chairmender, Pig-sticker, and a thousand other things.

If you want reliable work done by a man who has made Sanitary work a life's study, get

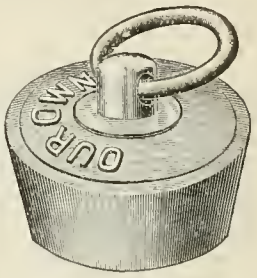
———, R.P.C.

OF ———,

to do it for you.

Our Own Basin Plug.

The accompanying illustration shows one of Our Own basin plugs, manufactured by H. O. Canfield, Bridgeport, Conn. It is described as made of a good quality of white rubber, with



Our Own Basin Plug.

nickel trimmings, and being put up one dozen in a box, forms, it is pointed out, an attractive addition to the goods on the shelves of the dealer. They are made in all regular sizes and finished in nickel.

TRAPS AND VENTS.

AT A REGULAR MEETING of the Master Plumbers' Association of Troy, N. Y., held on February 9 the following officers were elected: President, W. H. Barnes; vice-president, William F. Quinn; treasurer, William Ferguson; secretary, James Temple. The delegates to the State convention were George Bowman, E. J. Murphy, James Temple. The alternates, William F. Quinn, Charles Mills, Samuel Norris.

E. J. RYAN, Danville, Ill., is showing commendable enterprise in adding electrical plating to his line of work. In his shop on North Vermillion street he is placing vats and electrical appliances for plating with silver, nickel and copper.

THE CATALOGUE AND PRICE-LIST just issued by the Haydenville Mfg. Company, 73 Beekman street, New York, is a handy little volume, the size and neatness of which will appeal to the trade. It contains 560 pages, measures 6 x 4 inches and is bound in flexible covers with rounded corners. Included within its pages is a very extensive variety of brass goods for water, gas and steam. Among the goods of which they are the only manufacturers are the Haydenville steam metal ground key work, steam metal compression work, brass and steam metal pumps, syphon and ventilating water closets, bidet attachment, patent tanks, patent safety and vacuum valves; also a number of other specialties. The index of the goods is particularly well arranged; a short index, showing the general classification, being given before the general alphabetical index, by which reference to particular goods is made. From the short index a comprehensive idea of the contents may be obtained. It is divided as follows: Ground key work, compression work, hardware goods, self closing work, Peck's improved work, miscellaneous brass goods, pumps and hydrants, sanitary specialties, cast iron soil pipe and fittings, tools and steam work. The volume is profusely illustrated and tables of sizes and prices are given in all cases. Accompanying it is a sheet of discounts.

THE STORE OF JAMES AHERN, 280 Asylum street, Hartford, Conn., was specially arranged to make a fine show-

ing to the visiting plumbers at the State convention. One room was fitted as a bathroom and to display water closets and electric light goods. The Smith & Anthony Company were represented by a white marble lavatory, a Roman bath and Sanitas Regal and Royal; Peck Bros. Company by a sitz bath, a Tennessee marble lavatory, a triple jet syphon closet and a variety of plumbers' brass and nickeled goods, and the W. S. Cooper Brass Works by a Nautilus water closet. A handsome carpet covered the floor, and the side walls had the effect of tiling.

GEO. M. COUCH & Co., Hartford, Conn., in some recent hot water heating contracts have used the Caswell hot water circulator.

THE NORTHWESTERN PLUMBERS' ASSOCIATION met February 6, at Appleton, Wis., and elected officers as follows: P. H. Ryan, president; Geo. McCall, Chippewa Falls, vice-president; W S. Patterson, recording secretary; Henry Shisholm, Oshkosh, corresponding secretary; Geo. Smith, Oconto, sergeant-at-arms.

THE WHITLOCK COIL PIPE COMPANY, Elmwood, Conn., are issuing a new price-list of iron, brass and copper pipe coils made up to order. The circular contains illustrations showing the character of coils made. The company are now filling an order for six coils, each of which contains 300 feet of 2½-inch pipe. The pipe is joined by welding and bent without flattening while it is cold by special hydraulic machinery.

THE STOCK OF PLUMBING GOODS carried by Stockton & Kuhl has been purchased by David W. Yarbrough, dealer in plumbing supplies and gas fixtures, 18 East Hunter street, Atlanta, Ga.

AT A REGULAR MEETING of the Master Plumbers' Association of Boston and vicinity, held on February 8, the following committee was appointed to constitute a Conference Committee to confer and act with a similar committee from the journeymen's Union, that harmonious relations may exist between the two associations: William H. Mitchell, chairman; J. Warren French, Isaac Riley, J. K. Tulley, John Crawford, P. H. Winn, Robert F. Brown.

AS THE RESULT of a previous visit the State vice-president of Massachusetts, John F. Deedy, and Executive Clerk Crosby visited Malden to assist in the formation of an association of master plumbers in Malden and vicinity. On February 2 a second meeting was held and a permanent organization formed, with the following officers: President, B. O. Tilden, Malden; vice-president, A. F. Curtin, Medford; corresponding secretary, Alonzo A. West, Malden; financial secretary, H. A. Myers, Faulkner; treasurer, J. W. Hebblewaite, Melrose. More than 20 members were enrolled, with more promising to enter, representing Melrose, Malden, Medford, Faulkner, Everett and Maplewood.

THE PLUMBING FIRM of Desormo & Co., at Chillicothe, Ohio, composed of Charles Desormo and Dr. J. M. Stephenson, have been dissolved, Mr. Stephenson retiring.

H. MARSHALL has arranged a fine display of plumbing goods at his shop on the south side of the Square, at Lincoln, Ill.

THE COPARTNERSHIP heretofore existing between A. J., H. E. and W. F. Meyers, plumbers and tinsmiths, Faulkner square, Faulkner, Mass., is dissolved, A. J. Meyers withdrawing from the firm. H. E and W. F. Meyers will continue the business.

AN UNLICENSED PLUMBER in New York City was convicted February 12 and fined $25 for conducting business without a license. This is the first trial and conviction under the new laws, chapter 602, laws of 1893, and the offence was severely commented on by Justice Grady, who presided. The prisoner was told if he appeared before the court again on a similar charge he would be imprisoned. The fine was made light on account of the plumber's inability to pay a heavier one.

THE MASTER PLUMBERS' ASSOCIATION of Buffalo, N. Y., is sending out a notice to the trade through Charles F. Mensch, secretary of the Entertainment Committee, and Charles Geiger, chairman, announcing that the sixth annual convention of the State Association of Master Plumbers will meet in Buffalo on March 6. The notice adds that it is the earnest desire of the local association of Buffalo, as well as the State association, that every city and town should be represented at the coming convention, as matters of great importance to every plumber of the State will be brought up before the meeting. The Buffalo association is also desirous of knowing, so far as possible, how many from the different cities and towns may be expected. The headquarters of the delegates will be at the Tifft House, special rates having been made for them at $3 a day.

THE CRAWFORD HOUSE, Boston, Mass., was the scene of a hospitable gathering on February 9, when the master plumbers of Boston and vicinity gave a complimentary dinner to Isaac Riley, one of their most esteemed fellow members, on the eve of his departure for a trip to Europe. State President W. H. Mitchell was toastmaster. An incident of the evening was the presentation by James F. Davlin of a handsome token of remembrance, which he accompanied with some excellent advice in rhyme. National President Daniel G. Finnerty and ex-National Financial Secretary Thomas J. Tute both recounted incidents of their early days when they were journeymen with the guest, and Edwin Mills praised his sterling qualities in fitting verse. The following were among those present: Wm. H. Mitchell, chairman, president of State Association; J. Warren French, president Boston Association; Daniel G. Finnerty, president National Association; John B. Smith, Lewiston, Maine, State vice-president of Maine, N. A. M. P.; W. Emmet Crosby, executive clerk, N. A. M. P.; John W. Coaden, financial secretary Boston Association; T. J. Tute, E. Sheriffs, Wm. Lumb, Jas. F. Davlin, Jas. Tucker, N. W. Tucker, W. Bates of the Grundy Brass Works, H. H. Collins, Jas. O'Connell, J. C. Kelley, Thos. Sharp, T. J. Kurkell, Frank A. Titus, Edwin Mills.

GEORGE REILLY and Louis Lee have formed a copartnership in the plumbing business. They have a shop at 16 Gage avenue, Glens Falls, N. Y.

JOHN S. CRAIG, 59 Farmington avenue, Hartford, Conn., makes a fine display of modern plumbing fixtures in a handsomely fitted bathroom which is a feature of his showroom.

N. CLEMENS, plumber, has leased the store room at 70 West Main street, Massillon, Ohio, and will remove to that location soon.

FRANK A. WENDELL entertained National President Finnerty and his clerk at Salem, Mass., January 30, when preliminary arrangements were made for the association that was organized February 6 with 19 members, and who elected the following officers: President, Robert Robertson, Beverly; first vice-president, Frank A. Wendell, Salem; second vice-president, E. G. Kelly, Peabody; secretary, John H. Trow, Salem; treasurer, J. A. Andrews, Salem.

AN EFFORT IS BEING MADE to have several changes made in the Massachusetts State plumbing law that do not meet with the approval of the Boston master plumbers or National President Finnerty, particularly that which is to remove the requirement that plumbing inspectors must be practical plumbers.

THE IOWA STATE PLUMBERS' ASSOCIATION met at the Kirkwood House, Des Moines, February 6. The convention was called earlier than usual this year so that the plumbers could have an opportunity of asking the Legislature to enact a law to improve the sanitary conditions of Iowa cities. The bill that the association will work for provides for the selection of an inspector of all plumbing work in cities of the first class. The following officers were elected: President, J. A. Harris, Sioux City; vice-president, Henry Ewinger, Burlington; secretary, John E. Allen, Des Moines; treasurer, Robert Clayton, Davenport. The following Legislative Committee was appointed: J. E. Allen, James Wallace, John Burnside, Des Moines; J. A. Harris, Sioux City. The next convention will be held in Burlington.

THE ALBANY IRON COMPANY were incorporated with the Secretary of State, at Albany, N. Y., this week, to manufacture plumbers' supplies, brass and iron work and boilers in Albany. The directors are P. J. McArdle, T. J. Sullivan, T. E. Kerwin, William Mulholland, and J. H. Kennedy of Albany. Capital, $15,000.

THE EXECUTIVE COMMITTEE of the National Association of Master Plumbers met in Boston on the 14th and 15th inst., for the transaction of regular business.

A. J. PURDUE, representing Peck Bros. & Co., manufacturers of fine plumbing goods, New Haven, Conn., spent Thursday at the convention of the Connecticut State Plumbers at Hartford.

THE STORE of Thomas Oakes, 11 Haynes street, Hartford, Conn., is well lighted and shows off to advantage a line of Volunteer and Furman boilers, gas stoves, several styles of syphon jet closets, steel baths, enameled baths and gas fixtures. He has a large and well equipped shop and warehouse.

T. H. LANGDON, Hartford, Conn., recently succeeded to the plumbing business he previously carried on with a partner. He makes a specialty of suburban residence work, using Rider & Ericsson hot air engines for filling tanks, Dalton & Ingersoll Boston closets, enameled baths, and is at present well occupied. He also does hot water and steam heating.

PECK BROS. & Co., 259 Wabash avenue, Chicago, report a large increase in orders for general and specification work, from city and country. They anticipate a continual increase in trade and a healthy spring business.

J. H. Case has sold his interest in and retired from the plumbing firm of the J. H. Case Company, Green Bay, Wis., and that concern now do business under the name of the Green Bay Plumbing & Heating Company. John Callahan is president and John Anderson is secretary of the new corporation. Mr. Case is still in the plumbing business and has opened an establishment on Adams street.

The meeting of the Fox River Valley Plumbers' Association was held at Appleton, Wis., February 6, when the following officers were elected: President, P. H. Ryan, Appleton; vice-president, George B. McCall, Chippewa Falls; treasurer, J. Ahearn, Fond du Lac; recording secretary, W. S. Patterson, Appleton; corresponding secretary, Harry Cuisholm, Oshkosh; sergeant at arms, George Smith, Oconto.

Frank J. Knox, 314 and 316 Pearl street, Hartford, Conn., runs a full line of plumbers' supplies, from marble slabs and syphon jet closets to soil pipe and oakum. Steam and gas fittings, pipe and valves are made a specialty.

The Birkery Mfg. Company, Hartford, Conn., are busy filling orders for the Birkery patented high pressure ball cock, which is said to prevent hammering, singing or syphonage under any pressure.

The Durango Plumbing Company, Durango, Col., of which the firm members are F. B. Hannan, J. J. Gorman and F. H. Rivers, have dissolved partnership, F. B. Hannan retiring. Messrs. Gorman and Rivers will continue the business of the firm. Mr. Hannan intends opening a bicycle exchange.

M. L. Mandable, one of the prominent Chicago master plumbers, has moved his plumbing and gas fitting establishment to 258 South Clark street.

Edmund F. Butler, representing Dalton Ingersoll Company of Boston, found an abundant welcome with the plumbers at the Hartford (Conn.) convention.

W. H. Lloyd was at the plumbers' convention at Hartford, Conn., representing the Sanitas specialties of the Smith & Anthony Company, Boston, Mass.

C. G. Belfit represented the plumbing firm of Chas. Thatcher & Co., Waterbury, Conn., at the convention of plumbers at Hartford, Conn. He has secured the contract for heating the residence of the Rev. Hugh Trainor with a Gurney double crown hot water apparatus.

John D. Eldridge, plumbing inspector of New Haven, Conn., showed at the Hartford convention a valentine prepared by a quite young grandson, showing a plumber calking a joint in a soil pipe.

The local association of Master Plumbers of Boston entertained the Executive Committee of the National Association of Master Plumbers on Wednesday night. Among those present were President J. A. French of the Boston local, Daniel G. Finnerty, Jeremiah Sheehan, W. T. Goodman, M. J. Duffy, J. G. Weldon, David Smith, John Mitchell, John Trainor, Chas. T. Mensch, O. S. Kendall, John C. Brown, M. C. Hutchinson. An elaborate *menu* was disposed of and speeches were made by all, the orator of the assembly being James Davlin.

Henry Dunker & Co. are a new plumbing firm established at 325 Harrison street, Davenport, Iowa.

Connecticut State Plumbers.

The fourth annual convention of the Connecticut Master Plumbers' Association at Hartford, February 15, was the largest and most enthusiastic in its history. President Dibble of New Haven called the meeting to order and First Vice-President James Ahern of Hartford made an address of welcome to more than 100 delegates who were present. Routine business was then the order, a feature being the enrollment of 38 new members. During the session the Executive Committee of the National Association of Master Plumbers were announced and President Daniel G. Finnerty, Ex President Jeremiah Sheehan, Treasurer W. T. Goodman, James G. Weldon and M. J. Duffy entered and made brief addresses. At 2 p. m. the convention adjourned to the United States Hotel, where an elaborate dinner was elegantly served, accompanied by excellent music. James Ahern was toastmaster and introduced the speakers with grace and brilliancy. President Finnerty expressed his agreeable surprise at the success of the Connecticut association, and said the National Association was represented in every State, with a membership of over 3000, who did 90 per cent. of the plumbing in the country and were organized to promote sociability, sanitary legislation and trade protection. J. J. Wade of Chicago made the taking speech, and after making allusions, which created much laughter, to what he learned from James Ahern, he spoke of the good work of the association in elevating the craft. Other speakers followed, and it was 5 o'clock before the body adjourned to the hall to resume business. The following officers were elected: President, James Ahern, Hartford; first vice-president, J. B. Weiant, New Britain; second vice-president, C. S. Eames, Bridgeport; recording secretary, J. S. Craig, Hartford; financial secretary, R. H. Stohlhart, Middletown; treasurer, A. J. Clerkin, Hartford.

Builders' Tribute to Col. Auchmuty.

The National Association of Master Builders, in convention at Boston, Mass., on Wednesday last, adopted by a rising vote the following resolution in memory of the late Col. Richard T. Auchmuty of New York:

Whereas, The National Association of Builders mourns the death of Richard T. Auchmuty with a depth and sincerity which no words could hope to express; and

Whereas, In the founding and maintaining of the New York Trade Schools and in endowing others, Richard T. Auchmuty has conferred upon all young men who desire to follow mechanical pursuits incalculable benefits of precept and example, pointing out the way for others who may follow; and

Whereas, It is the earnest desire of every member of the filial bodies to offer some tribute to his life and work; to make some sign which shall indicate the deep sense of appreciation of his lifelong, self sacrificing and fruitful effort in the cause of education for the "American boy;" to extol, with earnestness, the true and consistent greatness of the man, the gentle simplicity of his nature, the tenderness and magnitude of his love for the boys of our country, which knew no limitations, and which gathered all to its shelter and encouragement, to share with his life and his possessions; and

Whereas, He had conferred distinction upon us by accepting an honorary membership in this association; therefore

Resolved, That the National Association of Builders, assembled in the eighth convention, offer this preamble and resolutions, inadequate though they may be, as a tribute to Richard T. Auchmuty and as an expression of the great and enduring sense of loss which his death has inflicted, and as a mark of fervent gratitude to his memory, to his character and to his work; and be it further

Resolved, That these resolutions become a part of the records of this convention; that a memorial page in the official report be set apart in his honor, and that they be sent to his family as expressing respectful sympathy at their irreparable loss.

Mica Gauge Glass.

The McClary Mfg. Company, London, Ontario, have applied for patents in Canada and the United States on an

Mica Gauge Glass.

improved gauge glass for creamer cans or liquid or dry measures, which they are putting on the market. The accompanying illustration shows a broken view of this new gauge glass, and the small cut at the side is a sectional view, illustrating the way the gauge is constructed. The special feature of it is the substitution of mica for glass as heretofore employed. The mica is held firmly in a tin frame, closely pressed together, so as to prevent all leakage, and enables the interior of the can to be seen as plainly as with glass. It is furthermore referred to as an improvement on glass, since it is not affected by heat, and will stand compression so as to make a perfect fit at the joint.

The rapid transit problem in Boston is about to be solved by the construction of subways for the electric cars. This plan is found to be the only one by which the obstacles to rapid transit presented by the narrow and tortuous streets of the city can be overcome. A bill has been prepared for presentation to the State Legislature, asking permission to make a tunnel 10,000 feet long, at an estimated expense, including land damages, of $5,000,000.

An ocean race of 14,000 miles came to an extraordinarily close finish last week in New York harbor. The race was between a Boston bark and a Nova Scotia ship, both of which left Hong Kong in October last. The Boston vessel had been anchored but one hour when her rival appeared in port.

TIN PLATES.

A Notable Wedding.

We have from F. H. Taylor, Philadelphia, the following account of a recent social event:

A very notable wedding was solemnized at noon yesterday, when Miss Guarantee Stamped, of Philadelphia, daughter of Heavily Coated Stamped, was united in marriage to Sir M. R. Terne-Plate, a son of the famous Lord Siemens Martin Steel Plate. The ceremony took plate at the Protestant Episcopal Church of St. High Grade, which was profusely decorated with ventilators, copper kettles and soldering irons, and was performed by the Rev. Fine Solder, rector of the church, assisted by Rev. Antimony Zinc and Rev. Bismuth Lead. The best man was Ensign Pure Tin. The ushers were William Wire, John Babbitt Metal, Robert Zinc, Clarence Iron Sheets and Joseph Continuous Ternes. The maid of honor was Miss Roofing Paint. The bridesmaids were Miss Emma Tongs, Miss Standing Seam, Miss Louisa Cleats, Miss Double Seamer, Miss Clara Side Flashing and Miss X. Terne Gutter. The bride was beautifully attired in a costume of agricultural brass spring wire, trimmed with tin shingles, wore a wreath of escutcheon pins with veil, had mica ornaments and carried a prayer book. The maid of honor wore a metallic brown costume and the bridesmaids wore seamless copper tubing, with old fashioned kerchiefs of stove boards reaching to the foot of the skirt, and carried bouquets of barbed wire nails. The bridesmaids entered the church upon each side of the chancel, and met the bridal party at the church door, escorting them to the chancel; the bride leaning on her father's arm, who gave her away. After the ceremony a largely attended reception was held at the residence of the bride's parents, 224 Full Weight street. The presents were many and costly. Late in the evening the happy couple left for an extended tour through the States and will be at home after March 31, at their new residence, 1894 Large Sale street, Chicago.

SCRAP.

THE TAIBACH TIN PLATE WORKS, Port Talbot, Wales, were recently sold at auction to D. R. David of that town for $72,000. The Yapitty Tin Plate Works, Loughor, South Wales, were also sold for $24,500 to a purchaser whose name has not transpired. In both cases the prices obtained were considered to be very low.

J. M. & L. A. OSBORN, Cleveland, Ohio, are distributing circulars calling attention to the terne plates which they carry in stock: Gilbertson's Old Method, Scott's Extra Coated, Hamilton's Best, N. & G. Taylor's Old Style, the Taylor Roofing, Merchant's Old Method and Roofing, also M. F. Old Style, Pontymister, Leominster, Alderly, Monongahela, as well as a number of their private brands, including Golden Star Old Style.

THE EXPORTS OF TIN PLATES from Great Britain during January show a small increase as compared with those of January, 1893, although the United States took 5000 tons less last month than in the corresponding period of 1893. The latter decrease was, however, more than offset by the increase in shipments to Russia, where the demand for tin plates for the Batoum petroleum trade is fast increasing. The total British tin plate exports last month were 31,969 tons, as against 31,377 tons in January, 1893. Of these amounts shipments to the United States were, in January, 1894, 18,000 tons, and in January, 1893, 23,000 tons.

A BALTIMORE DISPATCH states that the Baltimore Iron, Steel & Tin Plate Company of that city have secured control of the rolling mill and tin plate works of Coates & Co., at Locust Point, and will reopen them next week. Instead of simply dipping the plates, as has been done heretofore, the company will roll black sheets, and use these in the manufacture of their tin plates.

THE TOTTEN & HOGG IRON & STEEL FOUNDRY COMPANY, Pittsburgh, Pa., have just closed a contract with the Emlyn Steel & Tin Plate Company of Summitville, Ind., with main offices in Chicago, for a complete tin plate plant. It will consist of two 24-inch hot rolling mills, three 20 inch cold rolling mills and 600 horse-power Etna engine, with countershaft and gear wheels, four large steel tubular boilers, 150 horse-power engine, two doubling shears, one trimming shear and additional rolls for the hot and cold rolling mills. Work on this contract will be commenced at once and the machinery will be shipped as fast as possible. The Emlyn Steel & Tin Plate Company for some time past have been operating a tinning plant in Chicago, buying their black sheets in the open market; but on the completion of the new works the entire plant will be concentrated in Summitville, Ind.

VERY GREAT DISTRESS EXISTS, says the London *Iron and Steel Trades Journal*, in the Welsh tin plate districts. In addition to a large number of works totally idle, there are several in which less than half the mills are working, and where the men are only employed two or three shifts of six hours each. It is declared that numbers of people are literally starving, and that at least $5000 weekly is required for their relief. Some of the men are working on the roads as common laborers at from 50 to 60 cents a day.

THE NEW CASTLE STEEL & TIN PLATE COMPANY, New Castle, Pa., issue a circular describing the various tin plates they manufacture. The list includes the following brands: New Castle Best Coke, New Castle Coke, New Castle Russia Charcoal and New Castle Juniata Charcoal. The following terne plates are also referred to: New Castle Real Old Method, New Caatle Genuine Extra Coated and Shenango.

THE FOLLOWING WELSH TIN PLATE WORKS, some of which are ordinarily among the largest producers, are at present idle: Caldicot, Panteg, Pontypool, Ponthydyrun, Maesteg, Jersey, Foxhole, Landore, Penclawdd, Midland, Clyne, Cilfrew, Melyn, Burry, Ysnitty, Llangennech, Morfa Old Works, Morlais, Hendy, Glanamman, Ystelyfera, Nantlyglo, Villiers (Briton Ferry), Llantrissant, Blaina, Abertillery, Gurnos, Abercarn, Pontymister and Waterloo.

N. & G. TAYLOR COMPANY, Philadelphia, Pa., have secured the contract for the tin for the Fourteenth Regiment Armory, Brooklyn, N. Y., the brand to be used being Genuine Taylor Old Style Heavily Coated roofing tin. The first shipment will amount to over a carload. The same plate is being used on the Inman Steamship Company's pier on the North River and calls for over 200 boxes of the brand. The Grocers' Exchange Building has just been covered with it, as well as several other buildings in and about New York City.

THE GLOBE TIN PLATE COMPANY, who were recently incorporated in Illinois, are to erect works in Grant County, Ind., for which contracts have been let. For private reasons the exact location of the plant has not yet been made public. The main building will be 40 x 150 feet, with a wing 40 x 50 feet at each end, and be fitted up with modern appliances at a cost of $30,000. The engine room will adjoin the center of the main building on the opposite side from the wings, and be 30 x 40 feet. An office building, 35 x 45 feet, is also to be erected and furnished with all conveniences. The company's headquarters will be in Chicago.

THE OUTPUT OF TIN from the mines of Cornwall in 1893 was 7288 tons, against 8000 tons in the previous year, the average price for the year being $229.40, against $230.50 per ton in 1892. The *British Trade Journal* reports that the past year was far from being an encouraging one as regards the position of Cornish tin mining. Although the output of the mineral was fully up to the average of past years, so far as the larger mines are concerned, the downward movement in prices caused the existence of several of the smaller undertakings to cease.

THE works of the New Castle Steel & Tin Plate Company New Castle, Pa., are in full operation, turning out about 30 tons of black sheets per day, about one-half of this product being finished into tin and terne plates. Some extensive improvements are now under way by this concern, and when completed will materially increase their output.

A statement issued by the Chief of the Bureau of Statistics, at Washington, shows that 13,126 immigrants arrived in the United States during December, 1893, as compared with 22,719 in the same month of 1892. During the entire year the number of immigrants entered was 488,775. In 1892 it was 543,487.

THE LETTER BOX.

Reading Gas Meters.

From H. J. Davis, *Friendship, N. Y.*—I notice in *The Metal Worker* of February 10 that a correspondent sends a clipping from a New York paper relative to housekeepers' gas bills. Being a gas fitter and engaged in setting meters for a gas company, I am familiar with this class of work, and I submit the following for the housekeeper's benefit. Gas meters are looked upon by some people as a bugaboo—something that the collector of the bills looks at and makes out his bill to suit himself. This is a mistaken idea. No two families will burn gas alike; one family's monthly gas bill will be $4, and another's will be $6, showing the latter family burned more gas than the former. Different makes of stoves with different sized burners and mixers will make the difference. The reading of gas meters is a very simple matter, and if the gas company's collector is an honest man he ought to instruct the housekeeper how to read the meter whereby she as well as the gas company can know her monthly and daily consumption. In the gas meters which I set and are used here, the registering face has six dials; the upper one registers 2 cubic feet at one revolution; underneath to the right is the dial registering the hundreds, next dial the thousands, next the tens of thousands, next the hundreds of thousands, and the last dial to the left the millions. Note the position of the arrows on the dials, beginning at the left and reading to the right, and add up the amount registered by the dials. Making a record at the end of the month where the meter stood, and beginning there to read for the next month's amount, housekeepers will not be beaten by the gas company.

Cleaning Solder.

From H. I. T., *Scranton, Pa.*—Will you kindly give some method for cleaning wiping metal that has been made out of old joints?

Answer.—The usual method for cleaning solder that contains zinc or impurities is to burn sulphur on the surface of the metal, stirring it constantly so that the impurities in the solder may be brought in contact with the burning sulphur. The resulting dross can be skimmed off. A former correspondent of *The Metal Worker* recommend the use of common salt for the same purpose, which, he said, gave just as good results as sulphur and was much more pleasant to use.

Natural Wool Filters.

From I. C., *New London, Conn.*—In reading a foreign journal I saw where an English authority makes the following statement in describing the material used for filtering air for a heating plant, which no doubt will interest the Letter Box readers: "The air filtering material is natural wool, which is found to be far superior to cotton wool, as on account of its greasy nature it does not mat together when the incoming air is heavily charged with moisture. An example of such a filter may be seen in this town at the Shire Hall, where it has given great satisfaction."

Freezing Boiled Water.

From H. V. T., *Scranton, Pa.*—Please inform me through *The Metal Worker* why it is that water once heated will freeze quicker than cold water.

Answer.—In its normal state, or rather as it is ordinarily found, water contains a considerable quantity of air, held, we may say, in solution. The first effect of heating water is to expel this air, after which the formation of steam takes place. Water that has been boiled, therefore, is water devoid of air, and it is on this account that it freezes more readily than ordinary water which contains air. The reason is due to the fact that in the formation of ice it is necessary first to expel the air, the same as in the formation of steam. The crystallization, therefore, is retarded by the work of getting rid of the air that is dissolved in the water. This air is thrown off at the surface of the water and is also imbedded in the ice, as is seen in the air bubbles scattered through the frozen surface.

Plans for Heating Water.

From E. A. C., *Minneapolis, Minn.*—I inclose you sketch of a plan which I have used for heating water that has proved very successful and needs no further description than is given in the sketch.

Note.—We acknowledge the receipt of the above letter and do not reproduce the sketch, as it is practically the same as that which appeared in *The Metal Worker* of December 30, 1893, under the head of "Reverse Circulation," and only corroborates the information given by the former correspondent.

Difficulty with Driven Well.

From M. W., *Little Falls, N. J.*—I connected a pump some time ago to a driven well, which is about 35 feet deep. The well was driven by means of a 1¼-inch galvanized iron pipe with a point on it. The pump does not work very well; it is very hard to operate and the handle flies up every time it is lowered, acting as if there was something on the lower end of the pipe. I think that if air could get down to the water the pump would work all right. Can *The Metal Worker* or any of its readers give me some idea of the cause of the trouble so I can remove it?

Answer.—If the water level is 35 feet below the pump the trouble is due to attempting to lift water by suction beyond the greatest possible limit, and can be overcome by placing the valve chamber connected with the piston of the pump several feet below the point at which it is at present located. We do not believe, however, that our correspondent could have overlooked this important point. We would be glad to hear from our readers who are familiar with driven well work.

Water Backs Bursting Repeatedly.

From F. K., *Bound Brook, N. J.*—Having read in *The Metal Worker* of February 3 about the bursting of water backs in Brooklyn, I would like to ask if it was not partly due to the check valve in the cold supply of the boiler, and should not the supply pipe always be open to act as a safety valve?

Answer.—Without the check valve, in case of steam forming in the water back, the pressure would work against the street pressure and take care of the expansion of the water. With the check valve preventing relief from the back pressure, due to the expansion of the water, the strength of the fixtures would be tested. In this expansion of the water on being heated might be found another cause for the bursting of the water back. In case of the fire having gone out and all the fixtures being filled with cold water and a fire then started, any back pressure due to the expansion of the water would close the check valve, and the expansion might be sufficient to burst the water back as reported if it chanced to be the weakest part of the system.

Bad Stove Mounting.

From M. S. L., *Richmond, Va.*—I have read the different articles in *The Metal Worker* on failure to bake. A pernicious practice of the stove manufacturers at present is not puttying the stoves in all the joints. My experience in the last two years has cost me $200 in taking stoves apart and reputtying the joints and putting together afterward. I have now some stoves with no putty on any of the joints that I will return to the manufacturers. I sell about 800 stoves a year and now demand of the manufacturers that the stoves shall be thoroughly puttied at all joints, or they will be returned. I think that this is a growing evil and I have had a great deal of trouble with it.

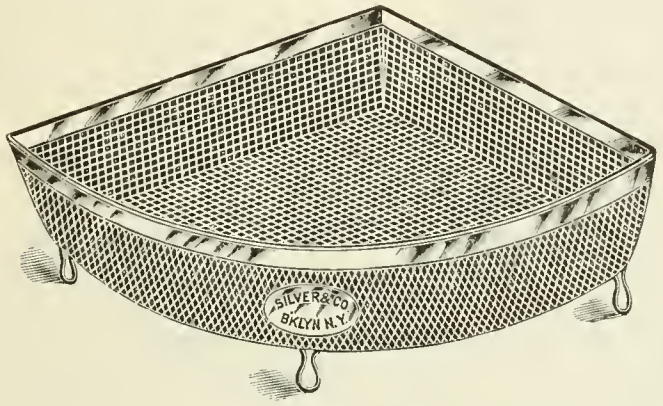
Buckeye Parlor Grate.

From W. H. B., *Burlington, Vt.*—Will some reader of *The Metal Worker* kindly inform me, through the Letter Box, where and by whom the Buckeye parlor grate is manufactured?

THE RETAIL STORE.

Sanitary Sink Basket.

Silver & Co., 304-310 Hewes street, Brooklyn, with New York office 20 Warren street, are introducing a sink basket, as illustrated herewith. This is made of tinned wire, measuring 8½ inches along the straight edges and 10 inches from the center of the curve to the corner at the back. It is designed to be placed in the corner of the sink, into which all water is thrown, so that the basket may retain all the solid matter from the dirty water. The water thus passes through, leaving behind refuse matter, such as tea leaves, coffee grounds, &c., preventing flooding and insuring a clean waste pipe. The solid matter may afterward be burned or otherwise disposed of.



Sanitary Sink Basket.

Flour Bin and Sifter.

The illustration herewith given represents a flour bin and sifter, offered by Silver & Co., 304-310 Hewes street, Brooklyn, and 20 Warren street, New York. The bin combines a receptacle, aërator and sifter, made of heavy tin, without seams, japanned and painted on the outside. The handled cup underneath the sifter is graduated, holding 3 quarts, and six turns of the crank gives a quart of sifted flour. The manufacturers claim that the bin keeps the flour or meal sweet and clean any length of time, that it is a safeguard against mice and insects; that the revolving flanges inside the bin thoroughly aërate the flour, keeping it fresh and free from mold or mustiness, and that its use avoids labor, waste and untidiness of reaching into barrels or sacks. The bins are made in three sizes, to hold 25, 50 and 100 pounds, and are designed to be placed on a table or shelf.

Flour Bin and Sifter.

The Columbian Faucet Can.

Hart Mfg. Company, Troy, N. Y., are putting on the market the can herewith shown, designed for oil and gasoline. The spout is hung on a swivel so that the stream can be stopped at once by raising the spout. It is claimed that the cut-off is so perfect that there is no possibility of drip or of waste. The spout, when not in use, is turned up within a hood, making it safe from breakage in shipping or loss of oil when not in use. The manufacturers state that the faucet is of brass and may be safely guaranteed not to leak, drip or break with proper handling, as it has no packing and is ground in such a manner that all wear is taken up at the end by a set screw, which can be adjusted by any one. The can is made of galvanized iron with tin top and has a perforated drip cup to prevent the escape of gasoline during transportation. It is stated that the can is safe and convenient, and that it may be closed up perfectly tight. In Fig. 2 is shown a top with hasp, which is designed exclusively for oil men, so that they only can fill the can, as the person having the key alone has access to the can for filling. The can is made in 5 and 10 gallon sizes.

Fig. 1.—The Columbian Faucet Can.

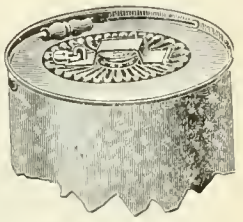


Fig. 2.—Top with Hasp for Lock.

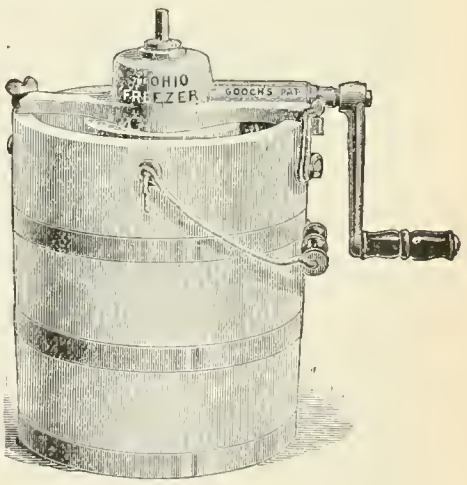
The Ohio Freezer.

The cut herewith represents a freezer offered by the Sam'l C. Tatum Company, Cincinnati, Ohio. The manufacturers state that the principal feature is the thorough way in which the cream is stirred up from the bottom; that there are no pockets left undisturbed, nor are there any places in the dasher to become clogged and difficult to clean, and that the dasher works clear out against the sides of the can. The dasher may be operated either from the side, as illustrated, or the handle may be placed upon the projecting end of the dasher itself. The can and the dasher are always given opposite motions and, the manufacturers claim, just

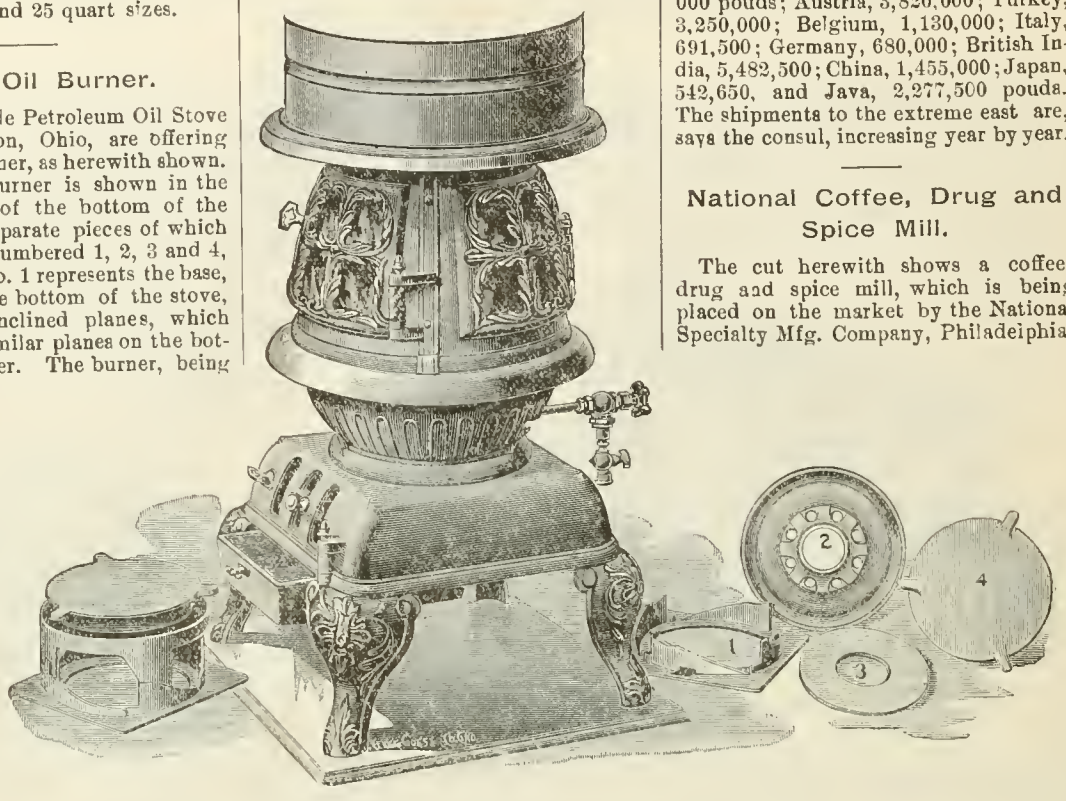


The Ohio Freezer.

as many motions as are necessary and no more; also that while the dasher goes through the top of the housing there is no chance for oil or dirt to drop through into the can. Freezers with crank are made in 2, 3, 4, 6, 8, 10, 12, 16, 20 and 25 quart sizes and with fly wheel in 16, 20 and 25 quart sizes.

Crude Oil Burner.

The Ohio Crude Petroleum Oil Stove Company, Ironton, Ohio, are offering the crude oil burner, as herewith shown. The complete burner is shown in the cut at the left of the bottom of the stove, and the separate pieces of which it is composed, numbered 1, 2, 3 and 4, on the right. No. 1 represents the base, which fits on the bottom of the stove, and has four inclined planes, which correspond to similar planes on the bottom of the burner. The burner, being



Crude Oil Burner

placed on the base and slipped into the lower part of the stove through the ash pit door, is rotated one-fourth revolution to the left; the planes acting on each other raise the burner to its place. The oil trough extends the entire distance around the burner, while the line of small holes surrounding the central opening in the burner is covered by plate No. 3, which partially covers the oil gutter. The small holes are cut away a little on the side next to the oil gutter, the object of the holes being to admit a sufficient quantity of air under plate No. 3 to support combustion, which it does, it is explained, by passing over the surface of the burning oil, and, mingling with it, causes a highly inflammable mixture, which passes out under the outer edge of plate No. 3. It is further explained that there it comes in contact with a volume of fresh air, which passes up through the central opening, and, striking against the bottom of plate No. 4, is deflected so as to come in contact with the vapor of the burning oil, supplying it with oxygen and making a mixture which burns with a bright blaze and intense heat. Testimonials attest to the efficiency of the burner and the satisfaction it gives, and the local Board of Insurance Underwriters are issuing policies permitting the use of the device. We are advised that the burner for heating stoves is at present only adapted for adjusting to the cook stoves made by the Foster Stove Company, Irontou, Ohio. Later, however, they will be made to adjust to any cook stove.

HENRY LEITCH is a Hartford, Conn., plumber who makes a specialty of hot air heating. He used 16 Barstow's Bay State furnaces last year.

The Handy Holder.

The accompanying illustrations, Figs. 1 and 2, show a handy holder which H. C. Weidenmann, 3517 Wallace street, Philadelphia, is putting on the market. The holder is made of sheet steel, and nickel plated. The shape of the clamp allows of adjustment to bars of any shape, round, square or oval. A tongue on one side of the clamp engages, upon pressure, with lips on the other side,

Fig. 1.—For Horizontal Bars.

thus when in service locking the holder securely to the bar. A strip of rubber on the inside of the clamp prevents scratching or rattling. The holder was designed chiefly for the purpose of holding or carrying decorations, coats, umbrellas or packages of any kind on

Fig. 2.—For Vertical Bars.

bicycles, although it is adapted equally as well for use on wagons or carriages as a rein or rug holder. It may also be used for a store window clip and for a variety of other purposes.

The Belgian Consul at Odessa, Russia, has recently forwarded to his Government a report of the petroleum trade of the Caucasus, from which it appears that 24,921,340 pouds (pouds = 36 pounds avoirdupois) of petroleum were shipped from Batoum during the first half of 1893, in addition to several million pouds of naphtha, lubricating grease and naphtha residue. Of the petroleum the principal recipient countries were as follows: England, 4,325,000 pouds; Austria, 3,820,000; Turkey, 3,250,000; Belgium, 1,130,000; Italy, 691,500; Germany, 680,000; British India, 5,482,500; China, 1,455,000; Japan, 542,650, and Java, 2,277,500 pouds. The shipments to the extreme east are, says the consul, increasing year by year.

National Coffee, Drug and Spice Mill.

The cut herewith shows a coffee, drug and spice mill, which is being placed on the market by the National Specialty Mfg. Company, Philadelphia. The mill is constructed of iron, the hopper and body being octagonal in shape, with round base. The novel feature in the mill is in the grinding adjustment. Coarse or fine grinding may be done by screwing or unscrewing the corrugated nut seen on the shaft. The nut is fitted with a brass

National Coffee, Drug and Spice Mill.

washer keyed to the shaft in such a way as to form a dead stop and thus cause the nut to revolve with the shaft. Loosening of the nut is, it is claimed, in this way entirely obviated. The mill is handsomely finished and ornamented and is pleasing in appearance. It is made in two sizes, Nos. 1 and 2, the latter having wheels instead of crank.

STOVE TRADE NOTES.

Cupola Management.*—IV.

BY DR. EDWARD KIRK.

Front.

The front opening of the modern drop bottom cupola is made so small that it is not necessary to place an apron or breast plate over it to hold the front or breast in place, as is done with the draw front cupola. The material used for putting in the front is generally the same as is used in making up the spout. The front is generally put in after the fire has burned up, but some melters put in the front before lighting and light from the tuyeres. Others make up the tap hole and half the front with a stiff mixture of fire clay and sharp sand before lighting up and fill in the other half after the fire has burned up. But as a general rule the entire front is left open to give draft for lighting, and the front is put in after the fire is burned up and about ready for charging. This gives sufficient time for drying it before the blast is put on.

When about to put in the front the ashes and dust are carefully brushed from the spout where the front is to be made, and the spout and front opening are wet all around with water or clay wash to make the front material adhere and insure a good joint. A breast of small pieces of coke is built in front of the fire, or a small board cut to fit the front with a notch in the bottom for the tap hole is placed in front of the fire to prevent the front material being rammed or pressed too far back into the cupola. A small iron bar or a round wooden stick is then laid in the bottom of the spout to form the tap hole.

If the front is made of molding sand or other material that is likely to crumble at the tap hole and be cut away by the stream of iron or be broken away by the tap bar, a little fire clay and sharp sand, or other refractory material, is placed around the bar or stick to form the tap hole. The front material of molding sand or loam is then thrown in and rammed solid against the board, sides, top and bottom of the opening. If the front is made of clay or sand, and worked wet, it is made into balls and pressed into place with the hands. When the opening has been filled the front is cut away downward and inward from the top and sides of the opening to the bar forming the tap hole, until the tap hole is not more than 1½ inches long. The surplus material from the front is then removed from the spout, the bar drawn from tap hole and the front and spout carefully trimmed up.

If the spout lining and front have been made up with clay and sand, or other wet material, a wood fire is built on the spout to dry it and the front. When the spout and front are made up with molding sand or loam they are generally dried by the flame from the tap hole before stopping in, and an iron plate is sometimes laid on top of the spout to concentrate the heat upon it.

Size of Tap Holes.

The size the tap hole is made depends upon how the iron is to be drawn from the cupola. If it is desired to run a continuous stream from the cupola the tap hole is made small to suit the melting capacity of the cupola. If it is desired to accumulate a large body of iron in the cupola and fill a large ladle rapidly when the cupola is tapped the hole is made large. The tap holes are made of various sizes from ⅝ inch to 1¼ inches diameter, to suit the different kinds of work. When it is desired to run a continuous stream it is very desirable that the tap hole should not be cut and enlarged by the stream. This is generally prevented by placing a very refractory material around the rod forming the tap hole. But some melters have a form in which they mold a tap hole from a carefully prepared material that will not cut and dry it in an oven or on a stove. This tap hole form, when thoroughly dried, is placed in position on a split fire brick and the front made up around it, which always insures a regular sized hole throughout the heat.

The front is generally made the full thickness of the lining and cannot be forced out by the pressure of molten iron if properly put in. When the front material is worked too wet it falls away from the opening at the top when drying, and the opening must be closed to prevent the escape of the blast. If the tap hole is made too long the iron may chill in it and the cupola cannot be tapped without cutting a new hole. This makes very bad work, for the iron is generally melted from the old tap hole by the stream passing through the new one, and the two holes become one. It is then very difficult to stop in or control the flow of iron.

When the front material is poor it melts into a semi-fluid slag that settles down and closes up the tap hole with a tough adherent slag that is difficult to remove. When this occurs the tap hole can only be kept open by continually opening it up with a tap bar. The only way to overcome this difficulty is to use a more refractory front material. Mineral fluxes sometimes make a front material fusible that is not otherwise fusible. When trouble is experienced in keeping the tap hole open when using a flux, or after one flux has been substituted for another, the composition of the front material must be changed or another material used.

When no board is used and the front material is rammed back into the fire until it becomes solid in the front, the front is ragged and soft on the inside and melts and makes a bad tap hole even when the material is good. A good front or spout lining can always be made from fire clay and sharp sand by mixing them in right proportions for the purpose for which they are to be used.

Locating Tap Holes.

I have already described the manner of putting in the front and forming the tap hole and shall here only consider the location and number of tap holes. The tap hole is placed in the side of the cupola from which it is most convenient to convey the iron to the work to be poured and it makes no difference in the working of the cupola upon which side it is placed if the bottom is sloped to throw the iron to the hole. One tap hole is sufficient to run the iron from any ordinary cupola, but two are frequently put in. In some cupolas two fronts and tap holes are put in side by side only a few inches apart and two spouts are made up so the tap hole can be kept in better order for drawing off the iron. They are tapped turn about, and in case too great a quantity of melted iron accumulates in the cupola they are both opened at one time. Two tap holes placed in this way can only be worked for hand ladle work at the same time and they cannot be worked to advantage even for that, for they are so close together the men are in each other's way. One tap hole if properly made and managed will run off all the iron a cupola will melt and it is poor cupola practice to put in two fronts and tap holes in this way.

Two tap holes are frequently placed in a cupola for convenience in carrying the iron from the cupola to the molding floors. They are generally placed on opposite sides of the cupola, to save carrying the iron around the cupola or from one molding room to another. Two tap holes are also placed in cupolas to facilitate the removal of the iron in hand ladles. Six 40-pound hand ladles are all that can be safely taken from a spout per minute. When more than this number of ladles are filled and removed per minute, the men have to move so rapidly there is danger of a clashing of ladles and spilling of iron, and when a heavy stream once gets away from the men and falls to the floor, it spatters and flies so that it is difficult to stop in or again catch it. When more than 8 tons are melted per hour in a cupola for hand ladle work, two tap holes are always put in. They are placed in the side of the cupola that is nearest the work to be poured, but always at a sufficient distance apart to admit of the men catching at one spout being out of the way of those catching at the other.

Slag Hole.

A slag hole for drawing off slag is sometimes placed in a cupola, but it is not used except when the cupola is run beyond the capacity to which it can be run successfully without slagging. The hole is placed below the level of the tuyeres, and when it is desired to accumulate a large body of molten iron in a cupola the slag hole is placed high. When the iron is drawn from a cupola as fast as melted the hole is placed low. The opening through the casing and lining is generally made oval and about 3 x 4 x 5 inches.

The slag hole front when the hole is placed high consists of a plug of the same material used for the tap hole front. The plug is placed in the outer end of the opening and is from 2 to 3 inches thick. A hole 1 inch diameter is

*Copyrighted, 1894, by Dr. Edward Kirk.

made through it for a tap hole, and the plug or front is cut away from the edges of the casing to the hole until the hole is not more than 1½ inches long. When the hole is placed low and the slag permitted to flow through the heat after it is opened the plug is made of loam or molding sand mixed with a little blacking to make it porous when heated, and the plug is placed in the hole on the inside flush with the lining. No tap hole is made through the plug when placed in this way, and when it is desired to tap slag a hole is cut through it with a sharp pointed tap bar. This material does not bake hard, and the entire plug may be cut out when necessary.

Slag chills more rapidly in a tap hole than iron, and is more difficult to tap or draw from a cupola, and when the slag hole is not properly arranged it cannot be drawn at all. If the tap hole is made small and long the slag chills in the hole and it is difficult to open the hole or keep it open. When the lining is very thick it must be cut away and the hole made large inside of the front, or the slag will chill in the lining the same as it might in the hole in the front. The hole in the lining can be made 6 or 8 inches diameter without injuring the lining, and a hole of this size will admit a sufficient quantity of slag to the tap hole to prevent it chilling. There is never any difficulty from the slag chilling when the front and tap hole are placed flush with the inside of the lining, for the slag is kept hot and fluid in the cupola, and may be drawn off whenever there is a sufficient quantity in the cupola to flow from it. It is therefore better to cut away the casing and lining, and place the front flush with the inside of the lining.

I shall have more to say about slag holes when considering the working of very small cupolas.

Slag Spout.

The slag spout is generally made with a round, flat bottom, and from 10 to 12 inches wide and 2 to 3 inches deep; but in many cases a flat plate is used in place of a spout, and it answers the purpose equally as well. The spout or plate extends from the slag hole to the bottom plate or a few inches below it, and is placed almost perpendicular. It is designed to carry the slag away from the cupola, so it will fall clear of the casing and bottom plate to the floor. The spout is placed at so great an angle that it is difficult to keep a lining or daubing upon it, and it is almost as economical to cast the spout of a good thickness, and when it is cracked by the heat and becomes worthless replace it by a new one, as it is to line it. When the spout is lined the same material is used for lining as is used for lining the iron spout, and it is made up in about the same way.

ODD PLATES.

"The New Process Cook Book and Catalogue" is the title of a volume of 250 pages, handsomely bound in white, which reaches us with the compliments of the Standard Lighting Company, Cleveland, Ohio,. As indicated by the name, it is made up of a large number of recipes for the housewife, arranged and classified in such a way as to facilitate reference and add not a little to the value of the publication. The volume may be said to consist of two parts, the first being devoted to illustrations and descriptions of the New Process goods made by the Standard Lighting Company. In connection therewith is also presented some reference to furnaces, torches, street lights, broilers, lamps, &c. There is a comprehensive index arranged alphebetically under the variety of food, and also alphabetically under each head. At the close of the volume attention is given to family ailments and simple remedies, table of measures and weights, interest rules, postal information, and a little more than a page of matter entitled "Law in Brief." There are also several blank pages for additional recipes. On the cover the price of the cook book is given as $1.50.

One of the most unique calendars for the new year which has reached us is that presented with the compliments of White, Warner & Co., Taunton, Mass. It is in the form of a pamphlet, made up of pages of heavy paper, the outer edges being cut in such a way as to conform to one side of the picture of a ship under full sail which adorns the front cover. According to the statements contained, the calendar was designed at the studios in England and printed by the Rafolith plates at the Fine Art Works in Saxony. A number of pages are adorned with colored designs of a varied nature, accompanied by extracts from well-known authors. The calendar for the year is divided into quarters, three months being given on a page. The covers are embellished with exquisitely colored marine views, while the binding is a golden cord stitched through the back and tied at the center.

The Union Foundry & Stove Works, at Frederick, Md., have been destroyed by fire. The loss is estimated at $15,000; insured for $3400.

The Bridge & Beach Mfg. Company of St. Louis, Mo., closed their works on the last day of January, preparatory to the erection of a new foundry, work on which is now under way. From a local paper we learn that the present four-story foundry building was erected by the late Hudson E. Bridge in the year 1848. On the levee front wall there is cut in one of the bricks a mark with the date 1858, giving the high water mark during the disastrous flood of 36 years ago and showing the water on the levee sidewalk to have been 4 feet deep. On another brick is the mark for 1892, showing a depth of 30 inches on the sidewalk. It is stated that these two bricks will be carefully removed and replaced in the wall of the new building at the exact hight they were in the original structure. In the reconstruction the levee molding floor will be raised 8 feet, making the entire block on a level with Main street. In making these changes the company probably regret most of all parting with their old walking beam engine, which has done such good service since it was erected by the old firm of Gaty & McCune in 1849. It is to be replaced by a modern 200 horse-power Corliss engine. According to the St. Louis *Republic* the new foundry building will be an immense affair, seven stories in hight, and extending from Main street to the levee. It will be equipped throughout with the latest improved machinery of the most approved design. The sixth and seventh floors will be used as mounting shops and other floors for starage. It is expected that the new plant will be in operation by May 1.

The Kohler Furnace & Steam Heating Company of 93 Union street, Boston, Mass., have issued a descriptive catalogue of the Kohler hot air furnace and combination heating apparatus patented and manufactured by them. In offering the volume to the trade the company state it is not their intention to dwell upon the necessity of heat for our comfortable existence, nor to discuss the question of the comparative merits of steam, hot water or hot air heating. The real question at issue is healthful comfort, and in an endeavor to define more clearly how such an end may be attained the company invite a careful perusal of the pages of the catalogue. Their apparatus is described at considerable length and illustrations presented showing the heaters in broken view, clearly indicating the interior arrangement of parts. A large portion of the pamphlet is taken up with testimonial letters from those who have used their furnaces and heating apparatus.

We are indebted to the Dippo Mfg. Company of Chagrin Falls, Ohio, for copies of pamphlets relating to the Ferrosteel ranges, which they manufacture. The first pamphlet presents a detailed description of these goods, together with illustrations of the several varieties in which the goods are made. There are also given tables showing various sizes, with dimensions of top and oven, as well as code words and list prices. The second pamphlet or catalogue calls attention to the Ferrosteel B ranges, which are the latest goods the company have placed upon the market. These are rich and attractive in their ornamental features, and are constructed in such a way as to give satisfactory results in operation. They are referred to as being of a high order of merit, and as proving popular with the trade wherever introduced. The company state that their plant is new and perfectly equipped.

The Evansville Stove Works filed articles of incorporation Tuesday, February 6, with the Recorder at Evansville, Ind. The capital stock is said to be $35,000 and the object of the corporation is to manufacture and sell stoves, hollow ware, tinware, &c. The directors for the first year are Henry S. Kahn, A. H. Kahn and Charles F. Meyerhoff.

The Richmond Stove Company, Norwich, Conn., distribute as a reminder to the trade a burnished peacock made of iron finished handsomely in nickel. This bird of gorgeous plumage is so disposed, with his tail feathers spread about him, as to form a shallow dish serviceable for an ash receiver or any similar purpose. It is a light and clean cut casting and is a worthy souvenir of these well known manufacturers of stoves and steam and hot water heaters.

Palermo Mica Company have forwarded to their New York office, 27 Peck slip, the cabinet, with specimens of mica it contained, which was on exhibition at the Columbian Fair, Chicago. All who are interested in a display of this character are invited to inspect it. There are three fine large slabs of mica in a perfectly natural state, just as they were taken from the company's mine in New Hampshire. One of these measures at the extremes 37 x 22 inches, weight 84 pounds. The company refer to it as the largest good piece ever mined. There are two or three other notable examples of mica in its natural state mounted in frames and hung on the walls. One unique piece of cleaned mica has been framed in oak as a pane of glass would be. It is exceptionally fine in quality and 20 x 12 inches in dimensions, rectangular in shape. There

are besides a number of packages, in various sizes, of cleaned mica in commercial shape for many purposes, including stove and electrical work, odd shapes for canopies and protectors for lamp shades, &c.; also ground mica for lubricating, for paint manufacturers and makers of wall papers, scene painting, &c. Among the minerals taken from the same mine are specimens of apatite, quartz, crystals, crystallized spar, crystallized quartz and beryls. The gem of the collection is a piece of dendrite, with a figure in it formed of some foreign substance which strongly resembles a fern.

The Kelsey Furnace Company of 339 West Fayette street, Syracuse, N. Y., report the outlook for the coming year as very encouraging, and state that their agents now on the road have secured a number of good orders with specifications for shipment in the near future. The company add that they are shipping a goodly number of sample orders at the present time. They are bringing out another size of their furnace, which is provided with a 21-inch fire pot. They have recently placed in the rooms of the Builders' Exchange, both at Brooklyn and Philadelphia, one of their corrugated furnaces, which was done for the benefit of those interested in and about the cities named, who have written asking the company for catalogues and where they can examine their goods.

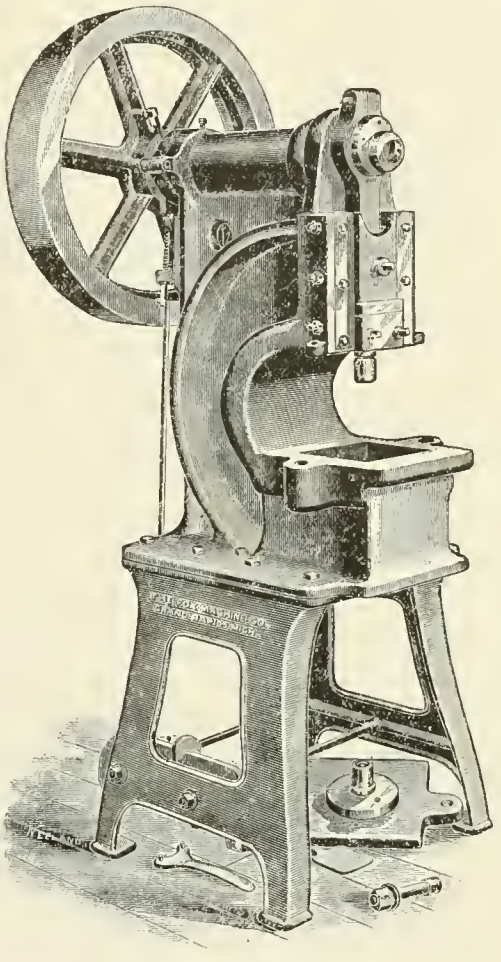
Advices from Ohio are to the effect that all the stove works in Wheeling, Bridgeport, Bellaire and Martin's Ferry are closed down. The men have been asked to accept a cut in wages amounting to about 10 per cent., which they have refused to do. Demand for stoves and hollow ware is very light, and the managers are not anxious to reaume even at a reduction.

At the annual meeting, in Keokuk, Iowa, of the stock holders of the Keokuk Stove Works, held recently, the following officers were elected: H. C. Huiskamp, president; Dr. L. C. Ingersoll, vice-president, and Charles Narrley, secretary and tressurer. The following Board of Directors was elected: H. C. Huiskamp, Dr. L. C. Ingersoll, I. M. Walters, Chas. Narrley, all of Keokuk, and C. H. Castle of Quincy, Ill.

The Grand Rapids Vapor Stove Company of Grand Rapids, Mich., are the assignees of a patent granted last month to Charles H. Child of that place for a vaporizer for use in connection with gasoline stoves. The object of the invention is to provide means whereby the vaporizing chamber will be maintained at a higher temperature and rendered more effective than usual, and consists of a hood or deflector so placed above the burner as to deflect the flame and throw the heat down upon the vaporizing plate. The burner employed has the form of a truncated cone, with radiated openings around the base and top for the escape of the combustible mixture. The annular hood or deflector is made in the same piece with the cap of the burner, and is connected thereto by means of radial bars, which leaves a space between the cap and hoods. The arrangement is such that the current of combustible mixture escaping from the upper openings of the burner comes in contact with the downwardly inclined inward surface of the hood and carries a current of air with it through the annular space between the cap and hood. The inventor states that as the hood is heated by the flame the mixture is also raised to a high temperature, giving a perfect combustion with a high proportion of air.

No. 3 Fox Punching Press.

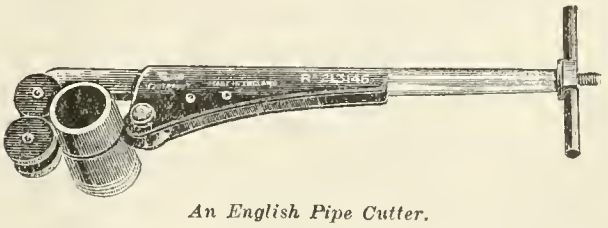
We show in the accompanying illustration a general view of the No. 3 Fox punching press, made by the Fox Machine Company, Grand Rapids, Mich. In building this tool the company aim at large space for adjustment between the slide and the bed and great depth from the center of the slide to the back of the throat, so as to make it capable of handling a large variety of work. They also point out that the metal has been disposed to the best advantage, giving strength with comparative lightness. In the present design they do not put on as large a fly wheel as ordinarily used, but compensate for the reduced weight by running it about twice as fast, thus getting more power and a quicker acting press. The opening in the bed is 8 x 9 inches, the distance from back to center of slide 8½ inches and the extreme distance from bed to bottom of slide 8½ inches. The stroke of the press, or motion of the slide, is $1\frac{3}{16}$ inches, or can be made any distance from 1 to 2 inches. The total weight of the machine is 2000 pounds and the floor space occupied 28 x 36 inches.



No. 3 Fox Punching Press.

An English Pipe Cutter.

In a recent number of the London *Ironmonger* there is illustrated an invention of Thomas R. Ellin of the Footprint Works, Sheffield, and which is known as the Footprint tube cutter. It is said to operate with a minimum of labor, as the material to be cut rests on anti-friction rollers set so that the burr thrown up by the cutter wheel does not touch them. All the working parts are of steel, interchangeable, and the cutter wheel is very large and set between steel sides, which can be tightened by a set screw to take up lost motion.



An English Pipe Cutter.

J. H. Shelly, with headquarters at Dallas, Texas, has taken entire charge of the affairs of the Peninsular Stove Company in that section. He advises the home office that the prospects in Texas are much better at this time than might be expected, and has received substantial encouragement in the way of several fine orders for immediate shipment. Stocks generally are said to be low, and stoves are needed right away. The better and more desirable trade are, as usual, looking for the best goods on the market.

TRADE REPORT.

The Iron Market.

Taken all together the news of the week may be summarized as being encouraging in a modest way. The volume of business is increasing, but the fact that prices in many lines are lower than ever shows conclusively that there are only too many mills desperately hungry for work.

Along the whole line of rolling mill products, with the exception of Wire, the tremendous competition continues and lower prices have been made than ever before. Rumors are being circulated that the most conspicuous of the Pittsburgh mills is withdrawing, but the happenings in the markets do not bear out that statement.

The situation in Foundry Pig is somewhat peculiar. Low Lake Ore and Connellsville Coke is enabling Western furnaces to crowd back the Southern producers from the Central Western markets and resales of Southern Pig from second hands at less than $6.50, Birmingham, for No. 4 Foundry (Gray Forge) are giving the primary markets for Southern Iron an appearance of weakness.

In New England, however, there have cropped up during the last week many evidences of a desire to contract far ahead. The majority of the largest transactions there have been captured at low prices by Virginia furnaces.

If something final were only done in Washington at once, the feeling would improve. Unfortunately, the low price of wheat, diminishing as it does the purchasing power of the farmers, is looming up as a new disturbing factor.

Pig Iron.—While agents of standard brands of Northern Iron have little new business to report, it is clear that Southern furnaces, and particularly those of Virginia, have succeeded in inducing a number of buyers in New England to cover their requirements for the current year. A radiator manufacturer in Connecticut has purchased 5000 tons to cover this year's requirements. A manufacturer of valves in Boston has covered his wants for half the year and is in the market for the other half. Two Boston stove foundries have purchased a total of 6000 to 8000 tons, all this business having been done on the basis of $12 @ $12.50 for No. 2 Foundry. The fact that these buyers have taken hold is regarded as a proof that some consumers at least are convinced that the bottom has been reached. Stocks in the hands of founders are notoriously lower than they have ever been, so that any spread of the buying movement is regarded as likely to bring about a recovery in values. The report from Louisville that Foundry Forge has sold at less than $6.50 is explained by the fact that during the panic when Southern furnace paper sold repeatedly at 24 % discount some of the companies paid their creditors with Pig Iron. It is this Iron which has been cropping up in the market from time to time and has sold at the record breaking prices. We quote standard brands $13 @ $13 50 for No. 1; $12.50 @ $13 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $13.50 for No. 1; $11.75 @ $12.50 for No. 2; $11.50 @ $12 for No. 3; $11.50 @ $11.75 for No. 2 Soft, and $12 @ $12.50 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $10.75 @ $11.25.

All that can be said in regard to the Philadelphia Pig Iron market is that sales are made with less difficulty, and that prices are maintained. Options that were given last month have nearly all been accepted, and while makers have not arrived at a point at which they refuse business at the old quotations, they are just as well satisfied to accept small orders for prompt delivery as large orders for long delivery. It is not easy to give exact quotations, but in general terms $11 @ $11.50, delivered, is about an average for good No. 3, $12.50 @ $12.75 for No. 2x, and $13 @ $13.50 for No. 1x. Some brands bring a little more, some can be had for a little less, all depends on the circumstances governing each particular transaction. At interior points, such as Harrisburg and York, lower figures prevail, the range for all deliveries at seaboard being about as follows:

No. 1 Foundry	$13.00 @ $13.50
No. 2 Foundry	12.50 @ 13.00

In Chicago the volume of business in local Coke is of good proportions, but no specially large transactions have taken place the past week. The market for such Iron, however, is widening, and inquiries are being received from localities in which Southern has for several years held undisputed sway. Our quotations on local Coke are based on small quantities, which at present constitute the great majority of transactions, but orders of some size are placed on an independent basis, on which the price is the subject of negotiations and consequently may be considerably lower. Only small orders are reported by sellers of Southern Coke. Lake Superior Charcoal continues quiet. Quotations are given as follows, for cash:

Lake Superior Charcoal	$15.30 @ $15.50
Local Coke Foundry, No. 1	12.50 @ 13.00
Local Coke Foundry, No. 2	12.00 @ 12.50
Local Coke Foundry, No. 3	11.75 @ 12.00
Local Scotch	13.00 @ 13.50
Ohio Strong Softeners No. 1	15.00 @ 15.50
Southern Silvery, No. 1	..... @ 13.75
Southern Silvery, No. 2	..... @ 13.25
Southern Coke, No. 2	11.50 @ 11.65
Southern Coke, No. 3	11.00 @ 11.50
Southern, No. 1, Soft	11.50 @ 11.65
Southern, No. 2, Soft	11.00 @ 11.50
Tennessee Charcoal, No. 1	16.00 @ 16.50
Tennessee Charcoal, No. 2	..... @ 15.00
Alabama Car Wheel	18.00 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

The demand for Foundry Iron in the Pittsburgh district is light, and prices show no inclination to improve. We note a sale of 200 tons of No. 2 Foundry at a price equal to about $11, delivered. Taken as a whole, the Pig Iron market is better than it was a month ago, but there remains plenty of room for further improvement. We repeat former quotations, as follows:

No. 1 Foundry	$11.75 @ $12.00, cash.
No. 2 Foundry	10.75 @ 11.00 "

While the volume of business in Pig Iron has been small in some of the Southern markets during the week, yet there have been some moderate lots sold in others, and at a lower price for Foundry Iron, which sets the pace for the trade, although it is claimed that the low prices that were made were exceptional and would not again be accepted. Southern Irons are about 25¢ ℔ ton lower than they have before been quoted. We give revised quotations for some grades of Northern Iron, but there is not much doing on them, and Charcoal Iron is very quiet. Quotations are merely nominal, as follows:

Southern Coke, No. 1	$11.25 @ $11.50
Southern Coke, No. 2	10.25 @ 10.50
Southern Coke, No. 3	9.75 @ 10.00
Ohio Soft Stone Coal, No. 1	14.50 @ 15.50
Ohio Soft Stone Coal, No. 2	14.25 @ 14.50
Lake Superior Coke, No. 1	13.00 @ 13.50
Lake Superior Coke, No. 2	12.00 @ 12.25
Hanging Rock Charcoal, No. 1	17.00 @ 17.50
Hanging Rock Charcoal, No. 2	16.50 @ 17.00
Tennessee Charcoal, No. 1	13.50 @ 14.00
Tennessee Charcoal, No. 2	12.50 @ 13.00
Standard Southern Car Wheel	16.75 @ 17.75
Lake Superior Car Wheel and Malleable	16.50 @ 17.00

Metal Market.

Pig Tin.—The level of prices has gone somewhat lower. Actual Tin has been offered and sold at 19.55¢ @ 19.60¢, net cash, prompt or near future delivery; offers to sell June delivery at a remarkably wide discount and other offers at as low as 17.75¢ @ 18¢ for deliveries toward the close of the year were quite as feebly responded to. Ordinarily there would seem to be something of incentive to speculative venture in this wide range of prices, but the inducements have thus far proven unattractive. The explanation is offered that consumers are extremely conservative, that outside speculators keep far on the outside in view of the compli-

cated condition of affairs and that the insiders are doing very little, for reasons best known to themselves. Hence a ragged sort of market and more than usual uncertainty pending solution of the problems that Tariff uncertainties make more than usually difficult to contend against. That there is enough Tin to meet current wants is plain. That there is a surplus seems to be quite probable, despite statistics tending to the contrary. Jobbers report a very moderate consumptive demand. Prices for small lots have been marked down to 21½¢ for Banca and 20½¢ @ 21¢ for Straits Pig.

Copper.—Not the least difficulty has been experienced in filling orders for Lake Superior Ingot at 9¾¢, prompt or near future delivery. Buyers, however, have been extremely few and far between. Well timed offers at 9⅝¢ for early deliveries were quite as ineffective in leading to business, and bids above 9½¢ have been exceedingly difficult to draw out. Other varieties have not fared quite as poorly, but they are slow of sale nevertheless, and 9½¢ for Electrolytic and 9¼¢ for ordinary casting stock are full rates where other than jobbing lots may be involved. A slightly improved demand has been noted during the past week from consumers, but sales comprise, as a rule, little beyond moderate quantities for immediate requirements. Jobbers are inclined to give concessions on small lots for spot cash, and prices rule generally from ¼¢ to ½¢ lower for all varieties.

Sheet Copper.—Sales of Cornice Copper continue very light. Cornice makers are by no means busy, in the best of times, at this season of the year. At the present time the general depression in the building trade, together with unfavorable weather, combine to reduce their work and consequent requirements in this line to a minimum. Prices on Sheet Copper incline to weakness, though nominally unchanged.

Pig Lead.—The market is weaker. It is easier to buy at 3.30¢ here and very difficult to secure bids above 3.20¢ here for prompt or future deliveries. The speculative interest seems to have enough, and consumers in this quarter are doing nothing to speak of beyond merely routine buying. Hence a dull condition of affairs and general hesitancy that effectually operates to check the intended influence of restricted production reported from some quarters of late. The current demand for retail quantities of Pig Lead continues to be of the slowest, and jobbers are apt to take orders at prices materially lower than the quoted rates. For jobbing quantities of American Pig 3⅞¢ @ 4¢ is quoted as the outside price. Little or nothing beyond a feeble routine business is being done in Manufactured Lead, notwithstanding the recent decline in prices.

Spelter.—Prices were carried up to as high as 4¢. There was no business. The maneuver seemed to have been purely speculative, with the backing of advices to the effect that an agreement has been made to restrict production with a view to turning prices for the better. In other words, it was a speculative move that is distrusted at present, since offers have very recently been made to sell at 3.85¢ @ 3.90¢ for carload lots, delivered here or at common points, while quotations from the West were relatively a great deal higher. It is still possible to obtain lots of a ton or so at 4¢ from store, even while carload lots are selling at that figure.

Nickel.—The range of quotations is 45¢ @ 50¢ Sales have been made latterly at 45¢, and that is doubtless the truest representation of actual market value.

Tin Plate.—No improvement has taken place in sales of any large amount for either prompt or future deliveries. Yet the retail market shows a more active movement to have developed during the week. Inquiries are more numerous and so are orders. Although the latter are generally confined to small quantities for prompt delivery, yet they are more frequently duplicated than has been the case of late, and make in the aggregate a fairly lively business for jobbers. The little spurt is attributed to the fact that consumers, as a rule, allowed their supplies to run out before replenishing them, and this they are only doing to the extent of their immediate requirements. Canners and can makers are rather more in evidence as purchasers, and this class of consumers are the most active customers. Business is, however, decidedly slower than usual, even at the present season, and nothing more than a hand to mouth trade is looked for until such time as the tariff question is settled. Stocks in the hands of importers are unusually low, but a good stock of imported Plates is kept in bond by many houses and drawn on piecemeal as required. Jobbers say that it was never more difficult to fill an order for any assortment of Plates, or for special kinds. Much "hunting around" among the trade is found necessary to make up such orders. There is little doing in Roofing Plates at present. Prices are soft, except for certain lines of light Cokes, and a reduction of 2½¢ @ 5¢ a box is not infrequently conceded.

A London cable to *The Iron Age* of February 14 reports the position of Tin Plates in the English market as unchanged. There is more inquiry, but prices are invariably low. The course of the Tariff bill in the United States has given a more hopeful feeling to British manufacturers. Fair orders have been placed for all sizes for both American and Russian account, but purchases are still below the average for the season, and there is no improvement in prices. Liverpool prices are quoted as follows:

IC Charcoal, Alloway grade	12/3 @ 12/9
IC Bessemer Steel, Coke finish	11/ @ ....
IC Siemens " " "	11/3 @ ....
IC Coke, B. V. grade, 14 x 20	11/ @ ....
Charcoal Terne, Dean grade	10/6 @ ....

Sheet Iron.—Black Sheets, except those of light gauge for tinning purposes, are little more than a drug in the market, the requirements of consumers appearing to be filled for the moment. Prices are demoralized and decidedly in buyers' favor. The demand for Galvanized Iron is a little better, although little is doing in cornice work, and the recent severe weather has set back construction work. The recent rise in the price of Spelter may, it is thought, strengthen the market for Galvanized Iron. Stocks of both Black and Galvanized Iron are fairly abundant.

Chicago Report.

Scrap.—There is no change in the market, which continues dull. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	7.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—The demand has not improved. Efforts are being made to maintain the regular schedule rates. Carload lots of 12 net tons or over are nominally quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

A. O. SCHOONMAKER, 158 William street, New York, issues a four-page circular directing attention to solid Sheet Mica for electrical purposes.

CONDITION OF THE

Hardware Trade.

TRADE IN JANUARY was undoubtedly much more satisfactory than for a number of months, and was, perhaps, on the whole, nearly up to the usual average for that month. It was, however, somewhat uneven, and with some houses the volume of business was much more satisfactory than with others. There is still a continued improvement to be noted, and the volume of business is growing. While trade is gradually assuming a more normal type it still, however, unquestionably feels the effect of the contraction and distrust of the past, and merchants are still placing their orders with caution and care. Orders from the small trade are referred to as covering a varied line of goods, in which seasonable specialties have a prominent place. Such orders indicate from their make up that stocks in nearly all lines are somewhat depleted. There is a disposition on the part of buyers, especially in the larger houses, to place orders for future rather than immediate delivery. Prices are without important change, though it is to be noted that on some staple goods the market is decidedly firmer than a few weeks ago. As a result of the business conditions which have existed for some time manufacturers in many lines have much less than the usual quantity of goods on hand, and it is not unlikely than if an active demand should set in more or less of scarcity would be developed. This is thought not unlikely to occur in Wire Cloth and Poultry Netting, lines in which there has of late been a good deal of active competition between the manufacturers. The prices on general Hardware continue on the whole fairly well maintained, but concessions are made somewhat more freely than heretofore, with a view to obtainiug orders. The financial condition is on the whole fairly satisfactory, and there is comparatively little complaint in regard to collections. There is also evidence that capital is beginning to seek investment in new enterprises, and this, with a more general resumption of work in mills and factories, cannot help having a good effect upon trade in general.

Advices from Chicago.—The volume of business steadily grows. In fact, there is more of a disposition to buy than jobbers generally feel willing to gratify. They are tightening the reins on those who have old bills hanging, and insist that such accounts should be settled before new obligations of any considerable amount are incurred. Although collections are good when everything is considered, yet there are an unusual number of merchants in arrears on last year who were grauted time during the financial stringency, and who now think still more time can be taken. Buyers whose credit is good are treated very differently. They are urged to load up and are advised that this is a good time to lay in stocks, especially of any articles in which the material constitutes the greater part of its value. Much stress is laid on the recent advance in Steel Billets, which is expected by the shrewdest jobbers to have a decided effect before long on a wide range of products. A recent interesting feature of this market has been the number of new stocks bought by parties in numerous places in the Northwest who believe that this is a good time to start in business. The heavy demand continues for all kinds of staple goods and gives no sign of an early abatement. Jobbers of heavy Hardware are not doing as much business as they would like and considerable complaint is heard among them of the backwardness of the trade. Orders are fairly numerous, but they are small, and the very low prices now prevailing make daily sales in dollars and cents seem discouragingly light.

Notes on Prices.

Wire Nails.—In sympathy with the advance noted below in Barb Wire, the prices of Wire Nails are higher, and the market is now represented by the quotation of $1.10 for carload lots at factory, with the usual advance for small lots. The manufacturers are full of orders, the trade both large and small having been purchasing freely since the opening of the year, and the tone of the market is firm, with some prospect of a further advance in price.

Advices from Chicago.—The change which has recently occurred in the Wire Nail trade is one of the most extraordinary events in the history of the business. It is but a few days since manufacturers were urgently soliciting orders and offering very low prices, which buyers seemed afraid to take up. Now the buyers are soliciting manufacturers to accept more business and are urgently calling for earlier shipments on orders they have placed. The factories are overflowing with work, some being well sold up to May, and yet plenty of buyers are turning up who have not covered their wants. Manufacturers' prices are about $1.20, Chicago, but higher rates are imminent because raw material is scarce and dearer. Wire Rods are hard to get, the mills being well sold up far into the future. The last cloud was lifted from the market a few days since, when all quotations were withdrawn by the then cheapest Wire Nail concern. What has happened in this trade is taken as an indication of what may be expected when buyers begin to stock up in other lines. Jobbers quote carloads and mixed carloads at $1.20 and small lots at $1.25

Cut Nails.—There is little change to note in the Cut Nail market and prices continue as before. The market in the East is represented by the manufacturers' quotation of $1.05 for carload lots on dock, New York; and the Western market by the quotation of $1 to $1.05 at mill. In sympathy with the improved condition of Wire Nails the Cut Nail market has, however, a somewhat better tone.

Advices from Chicago.—Manufacturers of Cut Steel Nails have not enjoyed as heavy an increase in trade as the Wire Nail people, but report a considerably larger movement, with prices still quoted on the basis of $1.05, Chicago, for 60-cent average. Jobbers sell small lots from stock at $1.15 to $1.20.

Barb Wire.—The improved condition of the Barb Wire market referred to in our last issue still continues and higher prices are now quoted by all the manufacturers. The market is now represented by the quotation of $2.15 for carload lots of Galvanized Four Point at Pittsburgh, $2.20 at Cleveland, $2.25 at Cincinnati or Allentown, and $2.35 at New York. The understanding between the manufacturers in regard to these advanced prices was reached in view of the fact that the demand has been heavy and most of the mills are well filled with orders. The expectation of a continued heavy demand during the season and the advance in Billets also influenced their decision. In this condition of things the market is decidedly firmer and manufacturers intimate that a further advance is not unlikely.

Advices from Chicago.—The movement in Barb Wire parallels that in Wire Nails. Manufacturers are doing a heavy business and the recent advance to $2.25, Chicago, for Galvanized has stimulated trade rather than checked it. Special brands of Wire are now firm at $2.40 and moving freely at that price. Jobbers report a much better business in this line and have advanced their quotations on carloads and mixed carloads to $2 for Painted and $2.40 for Galvanized, with 5 cents advance for small lots.

Rope.—There has been within the past few weeks no change in the current prices for Rope and the market is firmer than for some time. The manufacturers refer to the decline in prices as having been checked. The demand is, however, light.

Sample Holder.—Thompson's Sample Holder, manufactured by Massey & Thompson, Monroe City, Mo., is now sold at the following reduced prices: $7 per gross, assorted, four sizes; 65 cents per dozen in quantities less than half gross.

Cash Register.—The Improved Sun No. 10 Cash Register, manufactured by the Sun Mfg. Company, Greenfield, Ohio, is sold at $60, f.o.b. factory.

Climax Ratchet Stock.—Clarence M. Kemp is putting this device on the market. It is sold from the following list, which is subject to a discount of 25 per cent. to the trade:

No. 1, threads ¼ to 1 inch pipe. takes die 2 or 2½ inches square.....$10.00
No. 2, threads 1¼ to 2 inch pipe, takes die 2 or 2½ inches square..... 17.00

Shot.—The active competition between the manufacturers of Shot to which we referred in our last issue is evidenced by the reduced prices given below, which are announced under date February 12. Terms 30 days, or 2 per cent. discount for cash in ten days from date of invoice :

	Per bag.
Drop Shot, sizes smaller than B, 25 pound bags	$1.15
Drop Shot, sizes smaller than B, 5-pound bags	.35
Drop Shot, B and larger sizes, 25-pound bags	1.40
Drop Shot, B and larger sizes, 5-pound bags	.40
Buck and Chilled Shot, 25 pound bags	1.40
" " " " 5-pound "	.40
Dust Shot, 25-pound bags	2.00
" " 5-pound "	.45

In lots of 2000 pounds and upward taken at one time a discount of 5 cents per bag (25 pounds) will be allowed, together with a special discount of 2½ per cent.

The Bernard Pliers.—The following are the list prices of the Bernard Pliers, which are manufactured by Julius Berbecker & Co., 65 Duane street, New York. The list is subject to a discount of 30 per cent.:

Electric Plier.....$30 per dozen.

Flat Nose Plier.

	4½	5½	6½	Extra heavy. 7½ inch.
	$7.00	9.00	11.50	15.00 per dozen.
Extra Jaws	2.25	2.50	2.75	4.25 "

Round Nose Plier.

	4½	5½	6½ inch.
	$7.00	9.00	11.50 per dozen.
Extra Jaws.....	2.25	2.50	2.75 "

Cutting Plier.

	4½	5½	6½	Extra heavy. 7½ inch.
Per dozen....	$11.50	14.50	17.50	24.00

Sewing Machine Plier.....	$12.00
Extra Jaws..	3.00
" Knives.....	1 50
" Bolts and Nuts.....	.45
" Knife Screws.....	.25
" Punches.....	.50

Step and Extension Ladder.—The combined Step and Extension Ladder manufactured by Priestly Express Wagon & Sleigh Company, Grand Rapids, Mich., for whom Horace F. Sise, 114 Chambers street, New York, is agent, an illustration of which appeared in *The Iron Age* February 8, 1894, is sold at a discount of 35 per cent. from the following list:

Length.	Extending to	Each.
4 foot	7 feet	$1.75
5 "	9 "	2.00
6 "	11 "	2.25
7 "	13 "	2.75
8 "	15 "	3.00
9 "	17 "	3.50
10 "	19 "	4.00
12 "	23 "	4.50

Old Metals.—The market for Old Metals shows as yet no decided improvement. For some kinds of Scrap Iron, however, there is said to be a rather livelier demand, but prices continue low. The following quotations are about dealers' prices for New York delivery:

Heavy Copper	℔ lb		7¢
Light and Tinned Copper	℔ lb		6¢
Heavy Brass	℔ lb		5¢
Light Brass	℔ lb		4¢
Lead	℔ lb		3¢
Tea Lead	℔ lb		2½¢
Zinc	℔ lb		2¼¢
No. 1 Pewter	℔ lb		13¢
No. 2 Pewter	℔ lb		6¢
Wrought Scrap Iron....℔ gross ton		$7.00 @	$8.00
Heavy Cast Scrap.....℔ gross ton		7.00 @	8.00
Stove Plate Scrap.....℔ gross ton		4.00 @	5.00
Burnt Iron, ℔ gross ton...		2.50 @	3.00

Old Rags, Paper, &c.—The market for these materials gives a little indication of improvement, and prices continue weak. Quotations for New York delivery are nominally as follows:

No. 1 White Rags	℔ lb	3¼ @	3½¢
No. 2 White Rags	℔ lb	2¼ @	2½¢
Mixed Rags	℔ lb		¾¢
Blues and 3ds	℔ lb	1 @	1¼¢
Hard Sized White Shavings	℔ lb	2¼ @	2½¢
No.1 White Book Shavings	℔ lb	2 @	2⅛¢
No.2 White Book Shavings	℔ lb	1 @	1½¢
Light Book Shavings	℔ lb		¾¢
No. 1 Mixed Shavings	℔ lb	¾ @	1¢
No. 2 Mixed Shavings	℔ lb	½ @	¾¢
No. 1 Printed Books	℔ lb	1 @	1¼¢
Ordinary Mixed Books	℔ lb	½ @	¾¢
Newspapers	℔ lb	2-5 @	½¢
No. 1 Manila Paper	℔ lb	@	1½¢
No. 2 Manila Paper	℔ lb	⅝ @	¾¢
Bogus Paper	℔ lb		½¢
Common Paper	℔ lb		⅝¢
Straw Chips	℔ lb		½¢
Binders' Clippings	℔ lb	½ @	⅝¢
Jute Butts	℔ lb	1⅞ @	2 ¢
No. 1 Jute Bagging	℔ lb	1 @	1¼¢
Mixed Bagging	℔ lb	¾ @	1 ¢
No. 2 Bagging	℔ lb	½ @	¾¢
Hemp Twine	℔ lb	2 @	2½¢
Manila Rope	℔ lb	2¼ @	2⅝¢
Jute Rope	℔ lb	1½ @	1¾¢
Mixed Rope	℔ lb	¾ @	⅞¢

Old Rubber.—The market for this material remains very quiet. New York dealers' prices are nominally as follows:

Car Springs, ton lots, ℔ lb.	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb..	@	.03
Rubber shoes, less than carloads, ℔ lb.....0.02¼	@	.03⅛
Large Hose, ℔ ton.....	@	9.00
White Wringer Rolls, ℔ lb.	@	.04¼
White Syringes, ℔ lb.....	@	.05

On January 1, 1894, the copartnership composed of Albert R. Pritchard, John M. Milne (Charles D. Milne) and Millard F. Robeson, doing business under the style of the Rochester Stamping Works, Rochester, N. Y., was dissolved by mutual consent, the interest of John M. Milne (Charles D. Milne) being purchased by Millard F. Robeson. On the same date a new partnership was formed between Albert R. Pritchard, Millard F. Robeson and George W. Robeson, who will continue the business under the former style. They will pay all debts and collect all bills incurred by or owing to the Rochester Stamping Works.

Trade Notes.

The Aluminum Tea Kettles to which we made reference in a recent issue as being put on the market by the Griswold Mfg. Company of Erie, Pa., are at present made in size No. 8, which holds 6 quarts. The firm, however, are at work upon size No. 7, having a capacity of 5 quarts, and will soon have it ready.

"The History of a Lead Pencil," by Walton Day, is the title of an entertaining little pamphlet published by the Joseph Dixon Crucible Company, Jersey City, N. J. Of course the text refers very largely to the extensive line of Pencils manufactured by this well-known concern, but incidentally there is some interesting information given on the general subject. The inside covers, front and back, present companion pictures showing the countries from which the Lead Pencil materials are drawn. The former shows the graphite mills of the Joseph Dixon Crucible Company, at Ticonderoga, and the second is a scene in Florida, where they are rafting cedar logs to the Dixon mill at Crystal River. The back cover shows a view of the works in Jersey City.

The New Castle Steel & Tin Plate Company, New Castle, Pa., are manufacturers of the New Castle brands of guaranteed Tin and Terne Plates. In their advertisement elsewhere they direct attention to the fact that Lake Superior ores alone are used in making their steel, from which they roll their own black plate.

It is now reported that the Sheet mills of the Ellwood Steel Company, Ellwood, Pa., will not be moved to Cambridge, Ohio, to be added to the plant of the Cambridge Iron & Steel Company. The citizens of Cambridge made an effort to raise a bonus for the purpose, but the proceedings came to a sudden stop when it was announced that Ellwood parties had threatened to institute proceedings to enjoin the proprietors from moving the plant away from Ellwood. As a compensation for the disappointment, Cambridge is promised a tin plate plant in the near future. The Cambridge mills have been operated steadily during the crisis in trade and finance.

An advertisement on another page of Mortimer H. Cort, agent, formerly N. L. Cort & Co., 9 Burling Slip, New York, directs attention to Tin and Terne Plates, as well as Galvanized and Black Sheet Iron, Sheet Metals, &c.

R. M. Clough, Tolland, Conn., distributes circulars illustrating and describing some of his specialties. One circular relates to Clough's Hand Lever Punch. It is adapted to do any ordinary punching of sheet metal 3-16 inch and under, while iron ⅛ inch thick can be punched up to ½ inch diameter. Another tool is Clough's Improved Foot Press for sheet metal workers, which has a capacity for punching iron in the center of a sheet 36 inches square, and will take on a 5-inch pipe to punch holes 15 inches from the end.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

James Ahern, 280 Asylum street, Hartford, Conn., has the contract for the plumbing in the building of the Hartford City Gas Light Company. He will use 22 lavatories, 9 syphon jet water closets, 5 urinals, 2 slop sinks and a bathtub.

T. H. Langdon, Hartford, Conn., is remodeling the plumbing in the Cheney Building, using 54 Boston closets, and is doing the plumbing work in the residence of Mrs. H. W. Bowes, at Saybrook, Conn., where he will use a hot air engine, Boston closets, Mott's enameled baths, and a high grade of goods and work all through.

Thomas Oakes, 11 Haynes street, Hartford, Conn., erected the plumbing fixtures in the new Y. M. C. A. building, using 11 Nautilus water closets, and in the Free Library, using 7 Inodoro closets.

The Pequot boilers made by the Hopson & Chapin Mfg. Company, New London, Conn., have been used by James Ahern of Hartford, Conn., for heating the building of the Travelers' Insurance Company, the Hartford Hospital, the store of Henry Kohn, also his own residence and the residences of E. S. Goodrich, James A. Smith and Gen. L. A. Barber.

The Bosworth Heating Supply Company, Hartford, Conn., have installed hot water heating plants, using the American House Heater, in the residences of Chas. Herger, C. M. Holbrook and G. W. Richardson, and used the Plummer steam heater in the residences of A. P. Hyde and Mrs. T. W. Plympton and the Allen steam heater in the residences of F. W. Bakea and Dr. Howe.

At a recent meeting of the School Board of Northfield, Vt., it was voted to heat the High School building with steam, the apparatus to cost in the neighborhood of $1500.

T. P. Aitkin, Hartford, Conn., has the contract to do the plumbing in Goldschmidt & Hartman's new block in that city.

Trimble & Lutz, Wheeling, W. Va., completed a steam heating and plumbing job at the Spencer (W. Va.) Asylum. The work has just been inspected by B. H. Prather, Buffalo, N. Y., who reports that the air in all the buildings is changed by the apparatus every 15 minutes. The steam plant comprises six boilers, four pumps and three large fans, driven by separate engines. The steam plant is 400 feet away from the main buildings, the pipes being carried through a tunnel 6 x 8 feet in size.

The city of Houston, Texas, will receive bids up to March 6 for the erection of a High School building, in which the heating and ventilation, the plumbing and the gas fitting will be given as separate contracts.

A. F. Hussander is about completing a three story apartment house on Orchard street, near Wrightwood avenue, Chicago, Ill., which is to be heated by steam.

Lamson & Newman have designed a three-atory apartment house for George R. Allen, 746–748 Washington Boulevard, Chicago, which will be heated by steam.

The Board of Education of Detroit, Mich., will receive bids up to February 20 for the heating and ventilating apparatus, automatic flushing closets and urinals for two school buildings to be erected.

Hotel Champlain, at Sixty-sixth street and Champlain avenue, Chicago, will be remodeled, and will have a steam heating plant, gas fixtures and sanitary improvements.

Henry C. Wellington will erect at a cost of $30,000 a four-story apartment building at Thirty-fifth street and Wabash avenue, Chicago, that will be heated by steam.

Thirty thousand dollars will be invested by Thomas Coghlan in a three-story apartment house to be built at Macalister place and Vernon Park, Chicago, to be heated by steam.

Coones & Maher, Winona, Minn., have been awarded the contract for the plumbing, steam fitting and work of connecting the boilers at the power plant of the Rochester Electric Light Company.

At the official test recently made of the system of heating and ventilation installed by the Jennison Plumbing Company in the new Clarendon street school house, Fitchburg, Mass., the results obtained were unusually satisfactory. The tests showed that there was taken from outside the building, warmed and delivered without perceptible draft, an average amount of 51 cubic feet of fresh air per pupil each minute, whereas the State requirements only demand 30 feet. The system is so constructed that in mild weather the heating power can be reduced, with a corresponding saving in expense of fuel, while in the summer the same results in ventilation will be secured by running only a small fire in a heater separate from the main boiler.

The Walcott Hurlbut Company, 175–177 Lake street, Chicago, have received orders for the Eduction closet range for school buildings at Omaha, Neb., La Crosse, Sheboygan and Oshkosh, Wis.

The Kewanee Boiler Company, 96 Lake street, Chicago, have just furnished four No. 6½ Haxtun boilers for the flat building of Corse & Jeffery, Vincennes avenue, between Forty-sixth and Forty-seventh streets.

F. W. Lamb & Co., 258 Michigan street, Chicago, are to furnish the steam heating plant for the Equitable Building, Dearborn and Washington streets. Steam for heating will be taken from the Illinois National Bank Building, on the opposite side of the street.

The Model Heating Company of Philadelphia, New York and Chicago have been awarded contracts for heating by hot water two engine houses at Easton, Pa. The work will be installed by their Philadelphia office.

The Kelly & Jones Company, 141–143 First avenue, Pittsburgh, are to furnish the steam heating and power plant for the Westinghouse Company's shops, at Brinton Station, Pa. All of the buildings are of large size, the machine shop being 1000 feet in length.

The Baker & Smith Company, 193–197 Van Buren street, Chicago, are to supply a 54-inch tubular boiler and necessary radiation for the steam heating in St. Catharine's Academy, St. Catharine, Ky.

George Beaumont has designed for Parsons & Meyer a three-story apartment building on Emerald and Forty-fifth streets, Chicago, which will be heated by steam.

H. M. Hanson has completed plans for four three-story and basement apartment houses at Barry and Evanston avenues, Chicago, which are to be heated by steam.

It Is Reported—

That on January 29 the Hardware store of H. Lawrence, Rosamond, Ill., was destroyed by fire.

That the firm of Arnold, Thayer & Co., dealers in Hardware, Implements, &c., Chenoa, Ill., have been dissolved. William and Oscar Arnold have succeeded to the Implement part of the business, while C. E. Thayer will continue the Hardware department under his own name.

That Teel Bros.' Hardware store at Terre Haute, Ind., was robbed on January 27. A large quantity of Knives and Revolvers were carried away.

That E. J. Soper of the late firm of Alberty & Soper, Hardware dealers, Perry, N. Y., will after April 1 be connected with the Deering Harvester Company as traveling man.

That the Mansfield Hardware & Furniture Company have been incorporated at Mansfield, Ill., with a capital stock of $10,000. The incorporators are C. F. Mansfield, M. B. Mansfield and William Clemens.

That the Hardware firm of Hanke & Scharf, Newton, Iowa, have been dissolved by mutual consent. Philip Scharf will continue the business, Mr. Hanke retiring. The latter will take to the road for a wholesale house.

That Albert Bauman has bought a half interest in Henry Ammon's Hardware store at Peotone, Ill.

That Gus Haegg and Emil Kuhlen have bought out the Hardware firm of Clark & McKinney, Rockford, Ill., and will take possession of the business on March 1. Mr. Haegg has been in the employ of the firm and is well posted in the business.

That Klove & Mosey have bought out Hanson's Hardware store, at Ottawa, Ill., and will remove the stock to their own establishment.

That Charles J. Boesel of New Bremen, Ohio, has purchased E. P. Bennington's Hardware store at Galveston, Cass County, Ind.

That the Stoddard Hardware Company, Minneapolis, Minn., have been incorporated. The capital stock has been fixed at $50,000. Fred. L. Stoddard, Geo. P. Derickson and William B. Millar are the incorporators of the company.

That Samuel M. Wilkinson, formerly of Mansfield, Ohio, and later engaged in silver mining in Mexico, and Miles J. Watson, late of the firm of Godley & Watson of Mansfield, have entered into partnership under the firm name of Wilkinson & Watson, and will soon open a new Hardware store in Mansfield.

That J. A. Gleason has disposed of his Hardware stock at Tipton, Ind., to George Shortle.

That Andrew Mueller, North Milwaukee, Wis., opened his new Hardware and Stove store on February 1.

That the explosion of a tank of naphtha in the Hardware store of Durham Brothers, Maxwell, Cal., on the 26th ult., entailed considerable damage to the stock.

That M. L. Stringer has disposed of his Hardware business at Otisville, Mich., to Pettit & Craig.

That Col. J. F. Drish has sold his Hardware store at Mattoon, Ill., to Mr. Swickerd of Greenup, securing some farm property in exchange. Colonel Drish has been identified with the Hardware business of Mattoon since the close of the Civil War.

That Klavido & Stepanek is the style of a new Hardware firm organized at Traer, Iowa.

That the Hardware firm of Rood & Greenwood, Erwin, S. D., have dissolved partnership, Mr. Greenwood having disposed of his interest to A. W. Stone.

That Steinman & Smith have sold their Hardware store at Jenera, Ohio, to L. D. Reddick of Arlington, Ohio.

That the Hardware firm of Giddings & Patterson, Danville, Ill., have been dissolved. James A. Patterson retiring. The business will be continued by J. W. Giddings and his son, Frank A. Giddings, under the firm name of J. W. Giddings & Son.

That H. W. Crane & Co., Mt. Pleasant, Iowa, have sold out their stock of Hardware.

That the Falley-Patton Hardware Company, Lafayette, Ind., have been incorporated with a capital of $10,000. Susanna B. Falley, James B. Falley and Jacob Patton are named as directors for the first year.

That Auguste Couillard, Hardware merchant of Montreal, Que., has sold out his stock to Dumont Laviolette. The business will be continued under the old style by D. Laviolette and O. W. Lauriault.

That the Anderson Hardware and Furniture Company, St. Mary's, Kan., have been incorporated, with a capital stock of $5,000.

A Too Common Fault in Ventilation.

In many cases wherein a sufficient volume of air for ventilation has been provided for by mechanical aids, a noticeable fault in the system is the employment of ducts of too contracted area and the generation of too high velocity in the currents of pure air supplied. The evil effects are two-fold. In the first place, it is very disagreeable to sit in a room where the air is moved with undue velocity, and in the second place, the pure air supplied instead of remaining a comparatively distinct layer and pushing the impure air bodily out before it, thus removing the foul air from the vicinity of the occupants, is, by the violence of the currents, compelled to intermix with the impure air, thus greatly impairing the useful effect of the air admitted. Replacement rather than mere dilution or admixture is the main thing to seek in ventilation, and although some admixture is unavoidable, only a large volume moving at low velocity will secure the desired result in such measure as is attainable.

To Refresh the Cities.

The much talked of experiments of Professor Dewar, the British scientist, in the production of solidified air, appear to have stimulated the imaginative faculties of a correspondent of an English trade journal to an extent which must give his friends some anxiety. He proposes, in case these experiments are developed to a practical issue, the establishment of a new industry, which is nothing more nor less than the commercial preparation of solid mountain air for use in cities. Works, he suggests, might be started in Switzerland, New Zealand and other salubrious hill countries for the production of solidified Alpine air, which, sufficiently compressed and stored in seamless steel tubes, could be exported to London—for example—and let loose on the underground railway and other parts of the British metropolis, where such a "refresher" would be most appreciated. The idea is a seductive one.

A Mechanic's Eye.

BY FOSSIL.

It may be a question whether the possession of that talent or faculty which the title indicates is an unalloyed blessing, for the reason that oculars of that description are somewhat sparsely distributed and the deficient are constantly placing the evidences of their having "eyes which see not" in the way of the proficient, by a disregard of lines and levels. The mechanic's eye sees that the pictures and curtains don't hang plumb, the stove is not parallel with the wall, or its upright pipe perpendicular, and the same vexation is found in the street, where careening posts and oblique sign boards beget a desire to square things up. Although these mechanical irregularities are to educated eyes a so-called "eyesore," yet there is a fascination in their angles which compels regard and the acute gazer looks and loathes, while he who is obtuse can discover no fault. "Where ignorance is bliss, 'tis folly to be wise." When one of the "rectangulars" saw the celebrated leaning tower of Pisa he remarked: "I don't believe the man who built that ever got another job around here."

We read that "Poets are born, not made," and the saying would seem to apply to mechanics when their difference of efficiency is noted, and it is undisputed that men of equal technical training vary widely in its practical application. There is an old adage which reads: "'Tis education forms the common mind; just as the twig is bent the tree's inclined," but the statement is open to criticism, for although education or bending the twig may incline the shape of the tree it will not change its nature. For off thorns men do not gather figs, neither off a bramble bush gather they grapes, even if the said thorn and bramble are carefully bent in the time of twigdom. Circumstances have placed many a square man in a round hole which he may endeavor to fill but can never fit. There are infallible symptoms by which we may know the embryo mechanic, but these are commonly unnoticed or ignored by the guardians of our nonage, especially if they conflict with the optimism of ambitious parents, who see a possible President in every male child they are blessed with, and if circumstances will permit put it upon a life track of misfit gauge, which involves almost a rebuild. A young hickory tree may be bent and secured with its top reversed and growing earthward until a permanent crook is formed, which is desirable in a walking stick, but destructive of other and better uses of the tree. In like manner are young people forced or allowed to drift into foreign and abnormal means of livelihood.

How, then, may these evident mistakes be avoided—not cured—and of what profit would the improvement be? Phrenology claims to find the leading influences of the brain manifested by protruberances of the skull, but it requires an expert to read them; also in childhood they are liable to be complicated with accidental bumps. It is said that the Yankee baby—and the term means a trait rather than nativity—will develop the mechanic's eye very early, and apparently criticise the construction of its own cradle, which saying has a germ of truth in it and teaches the propriety of carefully observing the natural tendency of the youthful mind. There are college alumni whose educational veneer soon wears through, and graduates from the workman's bench who have attained to intellectual superiority. There is a lesson in the climbing beans which some of us have cultivated. When their tendrils begin to reach after a support, it is in vain that we offer them an unsuitable stick, or endeavor to train them away from the natural spiral. Wherefore let those who would train humanty consider the beans.

It is a grand thing that we have in these days the various branches of specific education, in which the youth, if circumstances allow a choice, may follow his natural bent. If the State for its own good assists in mental culture with measured success, would it not be wise and consistent to advance to more extended usefulness by a public support of technical schools, so that the advantage of being born with a mechanic's eye may not be lost through lack of pecuniary means? The country needs its army and navy, and provides the same at considerable national expense; also it requires artisans, whose right to free education in trade schools may be assumed for equal reasons. If when our boys advance from the destructive to the constructive age they are put—having the predilection—in (to be) State endowed technical schools the prediction may be hazarded that a less number of misfits will result than now appear among university graduates. We may not expect—should our wishes be gratified—an immediate mechanical millenium, but if the survival of the fittest is desired, we may earlier find out who they are. Botches, like the poor, will be always with us, yet it is possible to decrease their numbers by the sifting process of trade schools, for the inclination that leads the youth to enter will probably carry him more or less successfully to the goal he seeks. The term "Jack of all Trades" has been applied in derision to those workmen who are "everything by turns, and nothing long," a result of versatility of purpose rather than of talent. Yet may it not be given in honor to those who, having the mechanic's eye, can tell a straight stick from a crooked one, and are further qualified for handicraft by a self-chosen mechanical education.

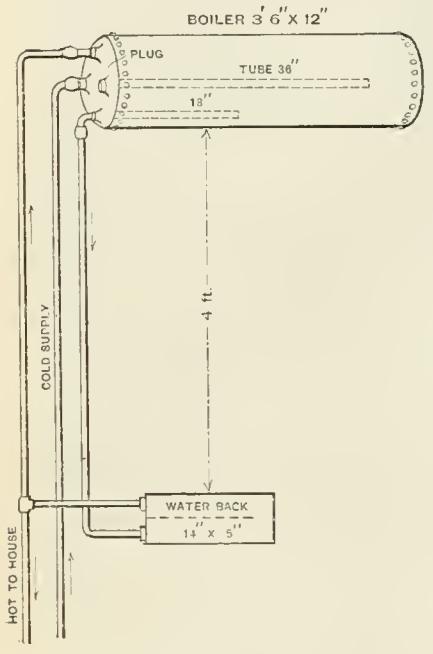
Such are the so-called "handy men," whose knowledge of the cardinal principles of any primary trade will enable them to see the possibility of their application to many others. In this age of labor saving machinery he who is merely the slave of the machine, and as easily discarded and reversed as a cog or bolt, will remain at a corresponding level, while those whose natural and acquired ability makes them its masters will advance in the attainments of head and hands. To this end let that quality known as the mechanic's eye be sought for, and when found carefully cultivated.

Efforts are being made toward an early reorganization of the Nicaragua Canal Construction Company.

THE LETTER BOX.

Cold Water from Boiler.

From H. and J., *Pennsylvania.*—The accompanying illustration is of a water back and range boiler that we have recently inspected that is giving but very little hot water. Two styles of water back and a coil of pipe have been used in fire chamber of range. The



Cold Water from Boiler.

boiler is located horizontally over the range, and it will be seen that the pipe for hot water to the house is also used as a circulating pipe from the water back to the boiler. There is a tube in the bottom connection of the boiler for carrying cool water from boiler to water back. The pipes are all ¾ inch galvanized, and seem to have plenty of elevation where required, but for some reason there seems to be but little circulation. The people who erected this work have put in a number of vertical boilers, which work well, in which they closed up the side or return opening in the boiler, and connected same with a T at the top of the boiler where the hot water supply is drawn for the house. Will you kindly give us your opinion in *The Metal Worker*, or refer us to a similar question previously answered.

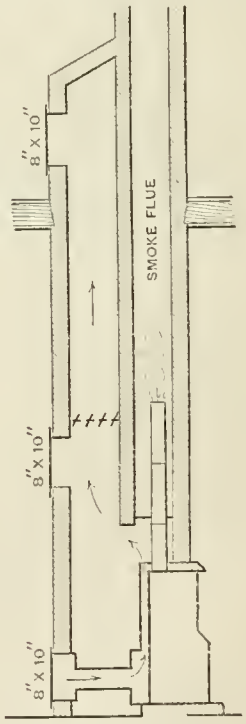
Answer.—The failure to secure hot water is due to the manner in which the connections are made. Cold water, being heavy, is the first to fall from the boiler. When hot water is drawn from a boiler cold water will enter and fall to the lowest point it can reach. Running the hot water service pipe down always interferes with the flow, and if connected as in this case, the hot water will not flow down because heavier and colder water can enter the pipe and prevent it. The movement of water through the piping shown, on the opening of a hot water faucet, would be, cold water would enter the boiler through the long tube and pass out through the short tube below to the water back and out of it through the usual hot water outlet and into the hot service pipe; the water flowing through the back so quickly that it is not much heated. This would not occur if the return pipe from the water back was connected at the plugged opening in the boiler and the hot water service kept separate. It is probable that no trouble would be experienced with the present connection if the hot water service ran up from the top of the boiler instead of down from the top of the water back. That some hot water can be drawn is probably due to the boiler being full of hot water at the start, but which is soon replaced to the level of the short tube by the cold water that enters. When the return from the water back is connected at the top of a vertical boiler a very different condition exists.

Pipes from Tank.

From M. B. C., *Christiania, Pa.*—Referring to difficulty of securing flow of water from tank to cistern through overflow pipe, as stated in *The Metal Worker* of December 23, I suggest two plans to overcome the trouble: 1. Instead of reducing overflow pipe from 3 inches at tank to 2 inches at outlet, reverse it, making 2 inches at tank and 3 inches at outlet, and he will have no trouble. 2. Instead of passing overflow pipe through side of tank and turning down into elbow, put up inside of tank to the hight desired, so the course will be straight down, and if there are no traps there will be no trouble.

Fails to Heat First Floor.

From J. J. WILSON, *Baltimore, Md.*—I notice in *The Metal Worker* of January 20 an inquiry from "A. G. D," Marlton, N. J., in regard to fire place heater, and the illustration I send will explain itself. It is very evident that parlor cannot be heated without a positive exhaust from it. By making a box-shaped enlargement in the back of the stove casing, so the cold air can have an easy turn, and attaching a pipe collar to this and the pipe leading from box attached to exhaust register, the room can be easily heated. Another source of trouble, I think, comes from the space between top of register and cut off, or flue damper, which is 4 inches. This should be so arranged that it would line up on a level with the top of the register, and would be better if back of cut off was lowered, so air would be deflected into the register opening. If the hot air flue is directly over the stove and the smoke pipe is carried to a side flue, all space back of the stove should be walled up to the hight of stove, and in a great many cases this is the cause of stoves not heating the room in which they are placed, as this permits the air to pass outside the casing and become only partially heated, while by being bricked up close all air passing under the stove is forced up between the casing and stove and thoroughly heated. Last November I was called to look at a stove in Philadelphia, put in by a customer, which had been taken down twice and some changes made, but without deriving any benefit. The house was on the east side of the street, exposed to west and northwest winds. The room in which the stove was placed was 12 x 22 feet, with three large windows, and the long side of the room with exposed wall. The stove set in one end of room 22 feet from further wall. The trouble complained of was that the stove would give plenty of heat in the two rooms above, but would not heat the room



Fails to Heat First Floor.

in which it was placed. Upon examination I found a space at the back of the stove of 12 inches. I had a wall built up directly against the back of the stove, filled in the space and placed an 8 x 10 inch exhaust register at the floor line, and connected same by a 7-inch pipe with a flue adjoining stove flue. Results, this room is thoroughly heated during the coldest weather.

Heat Proof Black.

From L. B. N., *Chicago.*—In reply to your correspondent "A. J. T.," Boston, Mass., who wishes a black coating for a locomotive boiler, I would refer him to the Nubian iron enamel made by the Nubian Iron Enamel Company, Cragin, Ill.

Fails to Heat the Room.

From READER, *Pennsylvania.*—I have had some trouble with a furnace of late, on which I would like to have some help. The furnace is in the cellar of a modern hotel, and has five 10-inch pipes connected to it. On the north side of the building there is a small addition built, covering a space about 10 x 14 feet, which is heated by a 10 inch pipe 16 feet long, which has a rise of 18 inches. There is no cellar under this new part, and the wall is not very well pointed, but this pipe is wrapped with asbestos paper, while the rest are not. I do not see why it will not heat. I did not set up the furnace myself. It has been in use about four years, and an 8-inch pipe was used before, but as it would not heat I thought by changing it and putting on a 10-inch pipe it would be all right. The other pipes all have an equal share of heat, but the pipe next to the one that fails to heat is a very short one; it only has one length of pipe and runs to a floor register. Some of our men think by running the pipe so that the rise is made in the first 4 feet, and then running the other 12 feet level that it will heat better, but that does not seem right to me.

Answer.—The long pipe is more than likely robbed by the short one, and if a sheet of tin is bent into a half circle and put into the top of the long pipe at the furnace so as to extend in and collect a body of hot air this trouble may be overcome. Giving all of the elevation to the first 4 feet of the pipe will not overcome the trouble, as the air has to flow against the prevailing air currents. A room is heated by a continual current of hot air coming into it, consequently some air must continually go out. If a door is open between this room and another, the hottest air will leave and the room will not be heated. If the door is closed and no flue provided for the air that has come in and cooled to get out, the amount of air that can come from the furnace will not be sufficient to keep the room warm. Under such conditions some successful furnacemen put another register in the room and run a pipe from it back to the furnace, so as to exhaust the cold air and leave room for the hot air to enter.

Difficulty with Drive Well.

From E. C. W.—Let "M. W.," Little Falls, N. J., whose trouble is reported in *The Metal Worker*, February 17, attach his pump to a ¾-inch pipe and slide the pipe down inside of the 1¼ inch driven well. If there is water enough within 25 feet, it can be pumped out. After this is proven and a larger supply of water is wanted than will come through a ¾ inch pipe, let him drive down another pipe within 1 foot of the well pipe, to supply air to it, and put his pump on the well pipe again. His well is air bound and any method that will relieve it will make the pump work. When he makes his pump work let him tell in the Letter Box how it was done.

From W. M., *Ridgewood, N. J.*—Having read in *The Metal Worker* of February 17 the letter of "M. W.," Little Falls, N. J., asking for information in regard to a driven well, I notice that he forgot to mention what depth or hight of water he has in his pipe. He may have overlooked the important point of attempting to lift water beyond the limit of 28 to 30 feet by not digging down and placing the valve cylinder and extending plunger rod lower. If this is not the cause, he has driven the point too deep. I find in my experience with driven wells that one can drive past a vein of water and have water in pipe, but it will still be air bound. I find by using a little precaution in driving, by stopping as soon as I strike the water vein, that 2 or 3 feet of water is enough, or sufficient to cover the strainer. Then water comes in freer and the pump works better than driving the point far below and having the water down along the pipe with 8 or 10 feet of standing water. So I would advise the correspondent above to pull up to where he first struck the water vein.

Better Marked Stove Repairs.

From 6-23-21.—In answer to "J. F. T." in the Letter Box, February 10, if he will do as I do he will save himself a great deal of trouble. I take my goods when they come in and mark them then. Some men may not be able to do this, as they do not know one piece from another, but they should learn.

From SHURTER & BRIGGS, *Poughkeepsie, N. Y.*—In answer to "J. F. T.," Meadville, Pa., in *The Metal Worker*, February 10, in regard to trouble with stove repairs, here is a slip that we use which saves us considerable trouble:

Paste Stove Polish.

From YATES & Co., *Rockford, Ill.*—In answer to "C. K.," St. Louis, Mo., in *The Metal Worker*, January 27, would say that if he will send us his full address we will mail him a pamphlet telling how to make first class paste stove polish at 3 to 6 cents per pound, that will prove a rust proof application and an elegant durable jet black luster.

Fails to Bake on Bottom.

From J. B. O., *Baltimore, Md.*—Referring to your note on page 30 of *The Metal Worker* of February 3, the theory advanced is very true, but practical experience is much better, although it may conflict with our theoretical ideas and perhaps put them to flight. In the mouths of two or three witnesses the thing is established, and we have them on that same page. "Stove Dealer," Port Henry, N. Y., says he obviated the difficulty by extending the flue strip. In several instances I have done the same thing. That was to prevent the products of combustion from passing too rapidly through the flue. "D. H. B." Phœnix, Ariz., writes that the flues of the ranges are too deep. Try putting ashes or sand, 1 or 1½ inches in depth, on the bottom plate. Why do that? Simply to reduce the size of the flue and stop the gases and heat from passing so rapidly through the flue. I have also tried that experiment and found it to work. It is a nice thing to strike a proper medium in the size of the flues in the construction of either stoves or ranges.

Left Handed Tinners.

From RIGHT HAND, *Pennsylvania.*—I would like to inquire of the tinners if any of them ever heard of a left handed tinker or tinner; that is, a tinner who cannot conveniently use his right hand, but must always use his left, and if there are any tools made for such a left hander. I know there are left handed snips, but never heard of any bench tools. Did any of you mechanics ever have any experience with such a man; if so, state your experience in *The Metal Worker*? I once had a man in my employ who was a good helper on outside work and the only difficulty with him was that he was left handed. He once tried to put up some spouting alone, as he had freely expressed himself that he could do spouting as good as the "jour." whom he used to help. The "jour." at last became disgusted with hearing it so often, and one day he left him at a job that both had started, to see what he really could do. The "jour." told him that he must go away to measure another job and that he should go ahead and spout the house until he came back. The "jour." was gone probably one hour and a half, and as he came around the corner on his return he saw a large crowd of boys and girls from a neighboring school. At first the "jour." thought that the left handed man had fallen from the ladder, but as he came near he saw what the excitement was about. The children were watching him try to solder with his left hand, and such soldering! Why, he had nearly a half a bar of solder on the ground, and such a looking joint! Some one in the crowd said the man was turned around and mistook his left for his right hand. To say that he was mad is putting it mildly, but then it took the conceit out of him, and he has since quit the tin trade, saying it was no trade where one cannot use his left as well as others use their right hand to work.

PLUMBING and GAS FITTING.

Plumbing Instruction at the Pratt Institute.

The pressing need in the larger cities of the United States for better facilities for the efficient trade education of American boys, in order to equip them for entering the manual trades and meeting the competition of foreign labor under the most satisfactory conditions possible, is a subject which, we are glad to notice, is attracting an increased amount of interest and attention throughout the country. The establishment of trade schools for this object has of late years received considerable stimulus from the marked success attending enterprises of this character which have been initiated in some of the Eastern cities. Among them that founded by the late Colonel Auchmuty in New York has been the pioneer and exemplar. Each of these schools has been started more or less on the original lines embodied in the New York Trade School, and each by success has proved the wisdom of this plan as a substitute for the old and inadequate apprenticeship system.

Pratt Institute Trade School.

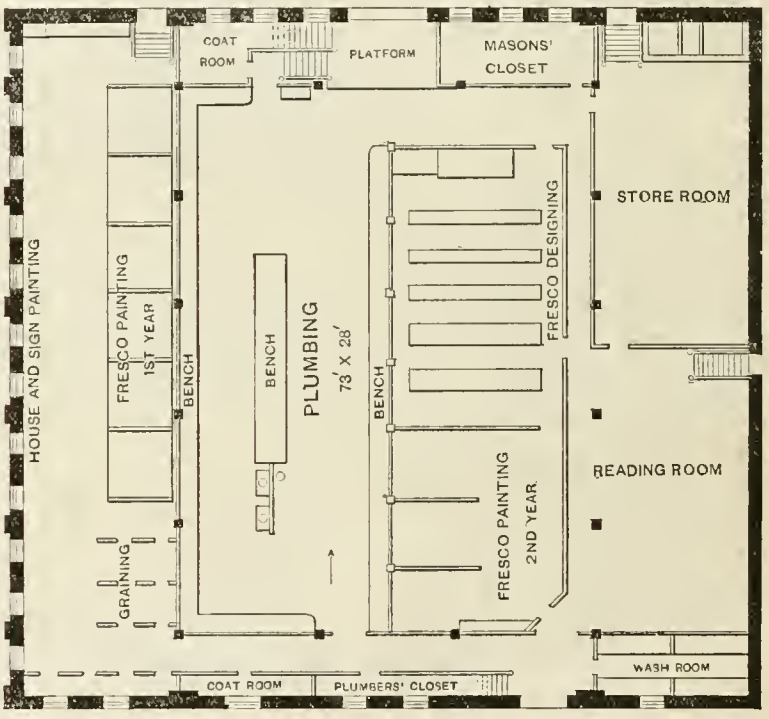
Among the best known and most complete of these institutions is the trade school attached to that successful center of manual and industrial training, the Pratt Institute of Brooklyn, to the good work of which reference has been made from time to time in these columns. In *The Metal Worker* of June 20, 1893, a notice was printed in regard to the plumbing class of the school, which appears to have drawn interested attention to the facilities for trade instruction there offered. We now take pleasure in presenting to our readers some further details respecting this flourishing and successful class, which, together with the accompanying illustrations, will furnish a good idea of a modern plumbing school, thoroughly equipped and in many respects a model of its kind.

The Trade School.

The Pratt Institute Trade School, of which the plumbing class constitutes the most important feature, in view of its size and the perfection of its arrangements, was inaugurated five years ago as an integral part of the Department of Science and Technology. This department occupies one of the largest of the imposing group of buildings forming the Pratt Institute, situated on Ryerson street and Grand avenue, in one of the most salubrious and accessible quarters of the "City of Churches." The structure occupied by the plumbing and painting classes is an annex to the Science and Technology Building. It is a substantially constructed fire proof edifice of one story, 103 x 85 feet, its internal arrangements being laid out in the manner indicated in the plan view, Fig. 1. The school is entered from the adjoining building by a flight of steps, shown on the plan, which lead into a reading room containing tables and chairs and furnished with trade and technical papers. This feature has been found to be much appreciated by the students, many of whom are in the habit of coming early in order to peruse the trade journals before class hours, thereby gaining much valuable information and assistance in the special line of their studies.

The Plumbing Class.

The room devoted to the plumbing class, shown in Fig. 2, is a lofty, light and well ventilated apartment 73 x 28 feet. It is equipped to accommodate 53 pupils at benches which surround the entire room. Each member of the class is provided with a gas furnace for melting solder and a drawer holding a complete kit of tools, consisting of the following articles, 23 in all: Knife, gas pliers, hammer, file, rasp, dresser, hook, wrench, copper bolt, soldering iron, ladle, pot, compasses, grease box, saw, large turn pin, small turn pin, rule, shave hook, soil cup, bending iron 1, bending iron 2, sand plug and tap borer. Every pupil is held responsible for the preservation of his own tools, and his kit is periodically mustered and checked by one of the instructors. In common with the evening classes the principal aim of the plumbing class is to broaden and extend the training of those already engaged in the trade. It is held on three evenings of the week, Monday, Wednesday and Friday, from 7.30 to 9 30, and is in charge of two instructors who are practical plumbers of reputation. A number of the pupils also attend the mechanical drawing classes of the institute on the alternate evenings, thus acquiring a competent knowledge of this accomplishment, which is becoming so valuable to the modern scientific tradesman.



Plumbing Instruction at the Pratt Institute.—Fig. 1.—Plan View of Trade School.

Attendance.

The class is primarily intended for the benefit of the apprentices and younger journeymen of the city of Brooklyn. It is not, however, confined to Brooklyn boys, for some or the present members hail from New York, Long Island City and Jersey City, and these latter are, it is said, among the most regular attendants. Regularity of attendance and punctuality are strongly insisted on. If a lad is absent on two consecutive school nights a communication is sent to him inquiring the reason. Should no satisfactory excuse be presented he is dropped from the course and cannot again join the class. However, we are told, it has very seldom been found necessary to resort to this extremity. The instructors state that the scholars, almost without exception, evince the most gratifying interest and delight in their work and the classes have been uniformly remarkable for their diligence and tractability.

Methods of Instruction.

The training is both practical and theoretical and calculated to thoroughly equip the learner for working at his trade in the shortest possible time. The courses of instruction are reduced to the most systematic form, and time is economized to the utmost. When the learner has mastered one thing thoroughly he is at once passed on to a new and more difficult operation. The reason for each step is carefully explained, and no operation is passed over before being thoroughly understood. The first exercises consist in making the pupil acquainted with the

names and uses of the various tools. In the manual course he is then instructed in regular order in preparing wiping cloths, making soil, tinning soldering irons, brass, iron, lead and tin, making solder, soldering seams, making cup joints, overcast joints, straight wiped joint, flanged joint and branch joint, working sheet lead into bends, traps, service boxes and safes, lining tanks, calking iron pipe joints and bending with sand and kinking irons. A study of the materials used and of the principles underlying practical methods and rules is made a prominent feature. In the plumbing class this instruction is given by means of talks and recitations. On each Wednesday evening of the course lectures are given dealing with the material used in the trade, the proper arrangement of drain, soil and waste pipe, drainage and ventilating the same, supply pipe, tanks, fixtures and boilers. Charts and diagrams are freely used in the instruction, and the examples of defective plumbing illustrated in the trade journals are frequently studied. Special pains are taken to make clear the principles underlying the plumbing rules of the City of Brooklyn. Those talks constitute a thorough analysis of the process of plumbing, and their substance is written down in note books arranged in the form of question and answer.

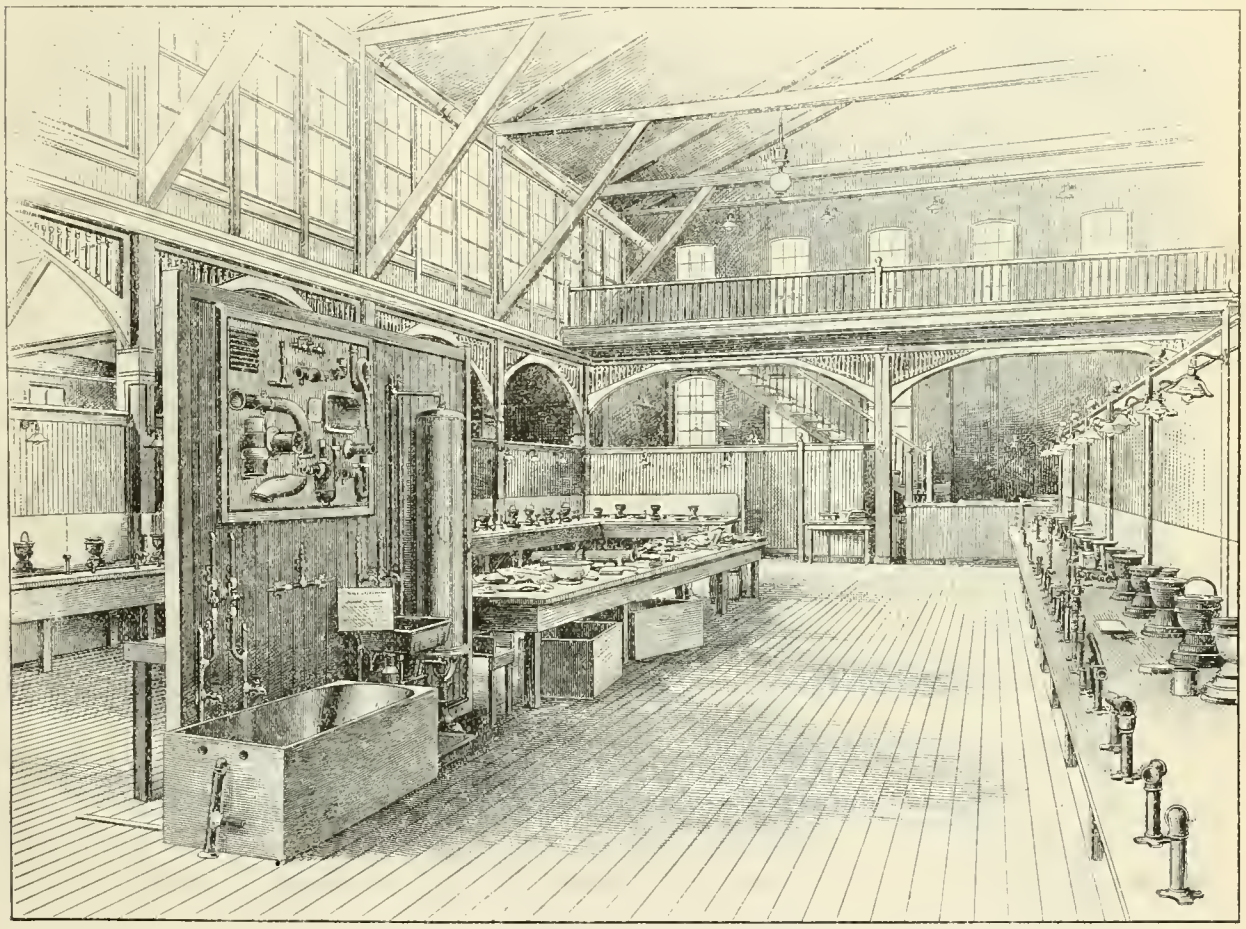


Fig. 2.—Plumbing Class Room.

Lectures and Question Books.

These books, which have been prepared for the use of the school by John Todd, one of the instructors, consist of eight separate courses, graded according to the progress of the learner. No. 1 treats of Drain, Soil and Waste Pipes; No. 2, Trapping and Ventilation of same; No. 3, Cold Water Supply Pipes; No. 4, Boilers; No. 5, Hot Water Pipes; No. 6, Trapping of Fixtures; No. 7, General Repairs; No. 8, Pumps and Miscellaneous Questions. These carry the pupil through every stage of theoretical education necessary to fit him for the duties of a modern, scientific sanitary plumber. The lectures are given in the lecture room of the institute by one of the instructors and last for one hour. He makes use of charts and the blackboard to illustrate and elucidate the subject. The various questions in the course book are taken up in turn and thoroughly explained. The first half dozen questions in Course No. 1 will give an idea of the general method. They are as follows :

1. Describe names and sizes of soil pipes used in buildings.
2. Describe their uses.
3. Of what material are they made ?
4. Why are iron pipes used ?
5. What are the objections to lead for soil pipes ?
6. Why are earthen pipes objectionable for house drains ?

Each pupil is provided with one of these books and also with a pencil and a pad of paper. On the latter he is expected to make notes of the lecture, copying them at his leisure into the blank spaces provided under each question in his course book. As each book is filled it is given in charge of the instructor, who keeps it until the end of the term. On the merits of the answers thus written, together with practical demonstration, depends the success or otherwise of the pupil when examined for his certificate at the end of the course.

Examination.

At the close of the course, which occupies two terms of six months each, an examination of the candidates recommended for certificates is held. A board, consisting of a committee from the Journeymen Plumbers' Association of Brooklyn, examines the members, due regard being had to both manual skill and the knowledge of trade methods, awarding certificates to those showing satisfactory proficiency. These certificates, in case of the holder afterward applying for admission to the association, are accepted in place of the examination of like character otherwise required. This arrangement, which has now been in operation the past two terms, is found to work admirably.

Prof. Charles R. Richards, director of the Department of Science and Technology, who is the manager of the trade school, in his last annual report speaks as follows in regard to this feature : "The result of the first year's cooperation with the Journeymen Plumbers' Association has been encouraging. The committee for the association have been regular in their attendance, and have displayed much interest in the progress of the class, and the students, on the other hand, have undoubtedly been considerably stimulated by their presence. The examination held by the committee in our company with our instructors at the end of the term resulted in the recommendation of three of the second year students as worthy of certificates." The number expected to graduate at the end of the current term will be much larger, as the three who were awarded certificates at the last examination happened to be the only pupils who

had been long enough under instruction to obtain the advantages offered under the new arrangements.

Instructors.

The two instructors at present in charge of the plumbing school have been with it since its inauguration. To them is mainly due the credit for bringing it to its present atate of efficiency. They are John Todd, an inspector under the Brooklyn Department of Health, and George Heath, both of whom are

John Todd, Instructor of Plumbing, Pratt Institute.

well-known and experienced Brooklyn plumbers. That their faithful efforts and personal influence have been felt and appreciated by the pupils is testified by a flattering presentation made to each at the close of the last term, when Mr. Todd was presented with a set of Dickens' works and Mr. Heath with a handsome chair. We are glad to be able to present herewith portraits of Messrs. Todd and Heath. The

George Heath, Instructor of Plumbing, Pratt Institute.

school, as we have intimated, is pre sided over by Professor Richards, who is a most enthusiastic advocate and sup porter of the trade school movement. To his unwearied efforts and fostering care the success of the school in general is largely due. Professor Richards is always ready to afford any information in regard to the trade classes to any who are desirious of availing themselves of the unusual advantages and facilities provided at the Pratt Institute Trade School.

We need only add that the full course of instruction, entitling a pupil to examination for a certificate, comprises two periods of six months each, beginning on October 1 and ending March 31. All tools and materials are furnished free of charge and a fee of $15 is payable for each six-monthly term. Applications are received only from persons between the ages of 16 and 25.

Sanitation in the House.

The following paper was read by Robert Morgan, New Haven, Conn., at the convention of the master plumbers of Connecticut, held at Hartford, February 15:

I wish to state before reading this paper on "Sanitation in the House," that it is not my intention to act the part of instructor to this body of men, but the subject having been assigned me, I will try to do it justice as far as I am able. Houses, though first erected to insure comfort and protection to the human race, often fail of attaining this object, and frequently become the indirect cause of many evils. These evils have led to much investigation and effort by scientific men, with results that have mitigated them to some extent.

WHAT SANITATION IMPLIES.

Sanitation is now a word in constant use, and communities, large and small, are interested in its significance. This word implies the adoption in the house of all snch means as science and the wisdom of students of hygiene approve of, for the prevention of disease and the promotion of health; hence many considerations enter into the construction of a sanitary dwelling—conditions of air, ventilation, water, drainage, &c. And first in importance is a plentiful supply of pure air. In former days, when people depended for warmth upon the blazing logs in the wide open fire place and strong currents of air swept in under doors and around the rattling windows, there was little danger of a lack of pure air, but in these days all is changed. Houses are built as nearly as possible air tight, and the cheery, open wood fires are almost a thing of the past. Experience has led us to devise new methods of getting a supply of fresh air, by means of the various appliances in connection with the vent shaft.

Water is one of the prime necessities of life and ranks next to air in its effects on human life. Some physicians even claim that disease is more frequently conveyed through the medinm of impure water than by the atmosphere. Pure drinking water at least is of the utmost importance to the preservation of health. The scientist claims that absolutely pure water can only be obtained by repeated distillations, but the sanitarian in speaking of pure water means water that is practically free from noxious gases, injurious organic matter and some mineral or metallic ingredients Water drawn from lakes situated at some elevation above the town supplied is regarded by sanitary experts as the best for general consumption. There should be a generous supply of water in the house, plenty to drink, plenty for the bath and an abundance for flushing purposes

It is a comparatively easy matter to bring water from a distance to supply large or small communities, but the problem of the present time is how to get rid of that water when we are done with it, together with its accompanying solids. In too many instances it is poured into rivers and harbors at the nearest point, there to pollute all waters that come in contact with it; in fact, making some of our rivers and harbors veritable open sewers, with their slimy banks exposed at every lowering of the tide, charging the atmosphere in the vicinity with germs that contribute to malarial and other fevers.

The time may be ripe in some localities for considering some feasible plan for removing the cause of this growing evil, whereby all sewage will be finally discharged several miles away, and as far as circumstances will permit from the habitations of man. This method of disposal undoubtedly involves great waste of material which might be utilized, and which, if treated in some other way, might become a boon to the farmer as a fertilizer. Science by the aid of heat or electricity may yet find means to cheaply convert this material into a valuable adjunct to some of our manufacturing industries.

GOOD DRAINAGE.

A third important consideration in the construction of dwellings is to secure good drainage. The function of a drain is to carry to its destination as speedily as possible all waste that can be removed by the use of water. It is of vital importance that the air in the drain should not be allowed to escape, except at such points as are specially provided. Soil, waste and drain pipes should unfailingly be air tight and water tight, having as great a fall as possible, evenly laid throughout and supported firmly in position.

Sanitation and hygiene imply cleanliness in all things pertaining to the house, and that the plumbing shall be perfect, as far as science and present knowledge of sanitary matters can secure. All soil, waste and vent pipes and their fittings inside of the house and for several feet outside of it should be heavy cast iron pipe carried to their several points convenient for the connection of fixtures, with as little horizontal pipe under the floor above the cellar story as possible; all pipes being exposed where practicable, and placed in such position as to be readily got at when necessary. All connections of one waste pipe with another should be in the form of a Y branch with a sufficient number of screw or bolted clean out openings to control the system of drain pipes.

Sanitary house drainage consists largely in the use of good materials and doing the work in a thorough and substantial manner, according to sanitary principles—viz.: Place a trap on main drain pipe, either in the cellar, near the front wall, or outside of the building, with access to either by a man hole. Place a fresh air inlet on house side of trap carried up on outside of house above the main roof or above the surface of the ground at a safe distance from the house. All rain water conductors should run up on the outside of building and be properly trapped. Extend all soil and other vent pipes full size up to the roof and increase size slightly above the roof.

Trap each fixture separately and as close to its discharge outlet as possible. Ventilate each trap by pipe of the same size as the waste pipe Ventilate from under each water closet seat by a 4-inch galvanized or copper pipe connected to a hot flue, or the draft may be created by an electric fan placed in said vent pipe. Leave a 4-inch opening in pipe at back wall under the seat with the pipe from the vent horn of bowl entering it and carried above hight of closet bowl. The remaining space not taken up by vent horn pipe is for additional ventilation.

In addition to local ventilation of water closets, ventilate by a proper draft system all the other fixtures in the house, especially slop closets and all basins in sleeping rooms between discharge opening of fixtures and the water in the trap; each fixture so arranged will then become a ventilator to the extent of the size of its outlet. Use the best plumbing fixtures with little or no wood work and set them on floors impervious to absorption.

Place a flush tank in attic above all fixtures, holding about 100 gallons, and near each line of soil pipe, with a 4-inch plug outlet, for the purpose of scouring out at intervals as much of the soil pipe and cellar drainage as possible.

Place a small receptacle under refrigerator with standing overflow bell trapped plug, the socket of plug flush with the floor, with waste from it emptying into the sink below, all put together in such a way as to be easily taken apart and cleaned. When this is not practicable, the safest way is to empty the vessel when necessary, rather than connect with the sewer direct.

When work is doneaccording to the sense of the above explanation there can be no pressure of foul air against the water in the traps from the collections that gather on the inside of all waste pipes. The traps cannot be syphoned out and there is no noise from one fixture to the other when either is discharged; and, furthermore, the plumbing will be absolutely free from impure air.

All clothes closets shonld be ventilated, and with hardwood floors and painted walls, the house may easily be kept supplied with sweet and clean air.

PLUMBING REGULATION.

There should be an inspector of plumbing in every town where there is a system of sewerage, to see that the health of the community is not endangered by the work of

unskillful plumbers. He should be a man of integrity who will honestly strive to have the plumbing laws rigidly enforced. He should also have been a practical plumber, one who has learned the trade and is familiar with all that appertains to sanitary house drainage. He should pass an examination before a local or State board of examiners who thoroughly understand sanitary plumbing. Again, all persons engaged in and those about to engage in the plumbing business should pass an examination before an examining board composed in part of competent plumbers who fully understand house sanitation. The above has reference chiefly to thickly populated districts.

The prospects in the near future for the energetic and skillful young plumber are grand and can scarcely be overestimated. Now that railways traverse this country from north to south, and from east to west, bringing communities closer together and opening up new towns, cities and villages, each competing with the others in the introduction of modern improvements, the plumber is called to let loose the pure waters from the land locked mountain lake, and from under the surface of the level plain, and to distribute it by a system of pipes and other appliances, requiring skill and mechanical ability to secure the ends sought, and deliver it to the householders and the "hives of industry," not only as one of the great necessities, but also as one of the greatest luxuries and comforts of life.

With good ventilation, pure air, pure water and perfect drainage, the incandescent lamp for light and indirect heat for warmth, all the conditions are right for health. A more general diffusion of knowledge in sanitary matters and a closer investigation on the part of property holders will result in raising the standard of health and lowering the death rate. When the public knows that sanitation insures greater freedom from sickness and consequent increased enjoyment of life, it will then regard the plumber as the health officer of the home, and the integrity of the man and the honesty of his work will be considered before a saving in cost of construction, and the family physician and the family plumber will stand side by side in the estimation of the householder.

Ohio Master Plumbers.

The annual convention of master plumbers of the State of Ohio was held at Toledo, February 13 and 14. It was called to order by President L. Poplowsky, and an address of welcome was made by J. A. Waite, president of the local association. After appointing the Committee on Credentials and Auditing Committee the convention adjourned. At the afternoon session Secretary Dewstoe's report showed a membership of 152, and 17 new members were added. The membership came principally from the smaller towns. The treasury was found to be in a good condition, showing a balance of over $100. At the morning session the following officers were elected for the ensuing year: President, Robert Raitz of Toledo; vice-president, E. A. Futerer of Columbus; recording secretary, T. L. Meissner of Toledo; financial secretary, E J. McNamara of Columbus; treasurer, Wm. Halley of Columbus; Executive Committee, ex-President Poplowsky of Cleveland, J. A. Gibson of Cincinnati, H. M. Stowe of Marion, Herman Appell of Sandusky.

At the afternoon session, on learning of the death of the first president of the association, the following resolutions were passed:

This association learns with sincere regret of the death of Edward A. Dean of Cincinnati, who was its first president. Therefore, be it

Resolved, That we testify in this manner to the grief we feel at his untimely death, and to our appreciation of the untiring zeal and far-seeing judgment with which he assisted in organizing the Ohio State Master Plumbers' Association. Also be it

Resolved, That these resolutions be spread upon the minutes of this association, and a copy furnished to the family of the deceased.

The association, after debate, decided to take no action on the apprentice question, which was brought up. Many other questions relating to the interests of plumbers were discussed. In view of the fact that a bill to govern plumbers and plumbing, similar to the Massachusetts law, will be offered at the next session of the Legislature, Vice-President Futerer's invitation to accept the hospitality of Columbus was accepted, and the next convention will be held in that city. The visitors were entertained by visits to institutions, drives, concerts and theater parties.

The Next National Convention.

The date for holding the twelfth annual convention of the National Association of Master Plumbers was set, at the recent session of the Executive Committee at Boston, for June 19, 20 and 21. The convention meetings will be held in Philharmonic Hall, Detroit, Mich., and the Cadillac Hotel will be headquarters. James Meathe, president of the Detroit Association, was present by invitation, and all arrangements necessary will be made for a speedy transaction of the business of the association and the entertainment of the delegates.

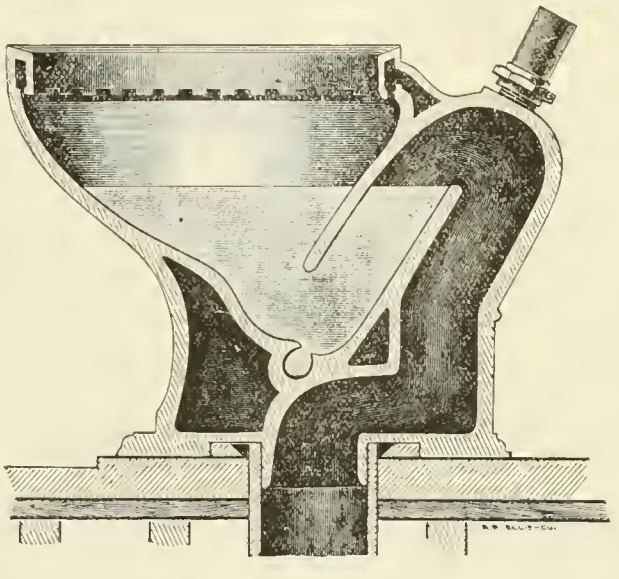
The Humboldt Syphon Closet.

We show in the accompanying illustration a sectional view of the Humboldt syphon water closet, made by Sumner & Goodwin, 15–21 Oliver street, Boston, Mass. This closet is said to be the outcome of the demand for a simple deep seal bowl that will flush out quickly and noiselessly, and will operate under any of the conditions that the wash out closet is adapted to. The water closet is all porcelain, the bowl of which contains a sufficient quantity of water when at rest to form a seal or trap of unusual depth and provide an effectual barrier against the passage of sewer gas. The design of the Humboldt is the result of a series of severe practical experiments. It contains neither weir nor lower trap, and in action it is said to be prompt and strong, as well as almost noiseless. Furthermore, it can be operated under any tank or valve. The Humboldt is made oval and square in a variety of styles and finishes.

Examinations in Plumbing.

From M. E. D., *Brooklyn.*—I read with interest the Letter Box of *The Metal Worker* and would like to have answered the sixth question in the "Examinations in Plumbing" that appeared December 30: "Sketch various forms of defective traps with which you are acquainted and also improved kinds you would recommend in place of same." Also the first portion of question No. 5 of the honors grade: "A water pipe running alongside a leaking drain receives an injury; describe the circumstance under which sewage can be sucked into the pipe at the point of injury while the pipe is charged with water."

Answer.—In printing the list of questions on which English plumbers are examined it was not our intention to be examined. Defects in traps are explained in "House Drainage and Sanitary Plumbing," a small work which can be obtained from the book department of this office. Sewage may be drawn into a water pipe which has a hole in it when the supply pressure is very low and the outlet taps are opened to reduce it more; then the pressure of the sewage inward on the pipe would be greater than the pressure of the water outward. Such a condition can be created by using a pump to raise water to upper floors of a building. Then the raising of the piston would tend to create a vacuum that would be filled by the entrance of the sewage.

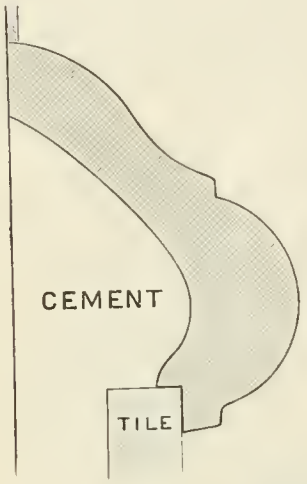


Sectional View of Humboldt Syphon Closet.

The Hollands Mfg. Company, Erie, Pa., are sending out their seventh annual catalogue of vises, machinists' and plumbers' tools and natural gas burners. They call special attention to their self-adjusting swivel base vises and hinged pipe vises. A number of pipe wrenches, tongs, cutters and threading tools are shown and a variety of gas burners, some specially adapted for use in cooking stoves.

Tile Molding or Binder for Tile Walls.

The J. L. Mott Iron Works, 84-90 Beekman street, New York, are now offering their own patent tile cap or binder molding for tile wainscoting, as here shown in Figs. 1 and 2. This



Tile Molding or Binder for Tile Walls.
—Fig. 1.—Sectional View of Molding, Showing Method of Binding Tiling.

cap is the result of a number of trials and experiments looking to a satisfactory method for finishing the tops of tile wainscotings in bathrooms or elsewhere. It combines a fastener for the top course of tiling and a cover to conceal the cement used in setting the tiles. From the fact that the lower edge of this cap is recessed, any slight irregularities in the top of the upper course of tiles are covered. The top of the cap being arranged to cut into the plastered wall above tiling permits the white finish coat to lap over the edge of the cap, thereby insuring the permanency of the cap and binding the whole wainscoting to the wall. They supply angles of the same type for turning corners. This concern have in preparation a number of cap moldings on the same principle, which will be ornamental in character, and of which they will soon be in a position to furnish designs and prices. The moldings now ready are in white or ivory tint. Referring to imported wall tiles in general, they add that their experience has been that only small quantities have been imported and kept in stock by dealers. To overcome this great inconvenience and annoyance to the trade, who often cannot wait for tiles to be brought out on importation orders, they are making a specialty of keeping constantly on hand a large assorted stock of these goods from which to execute orders promptly.

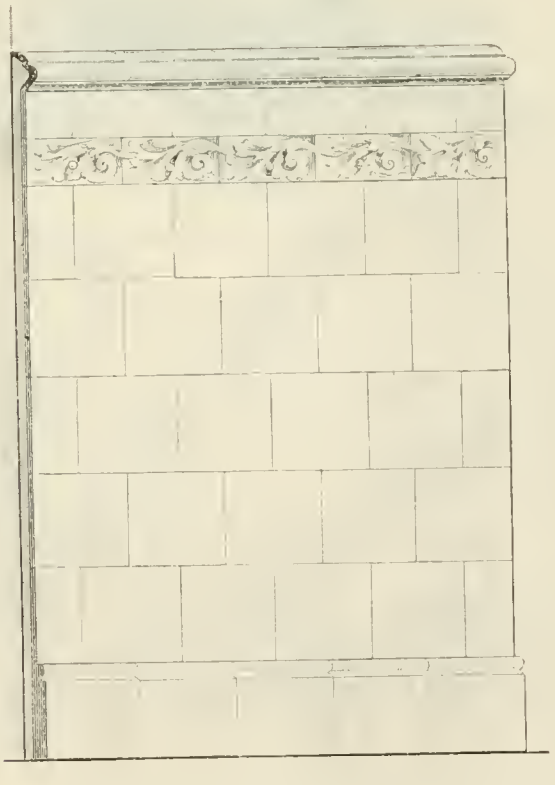


Fig. 2.—Front View, Showing Cap in Position.

TRAPS AND VENTS.

EDWARD MCGOWAN, secretary and treasurer of the Master Plumbers' Association of Memphis, Tenn., writes us that their association was recently formed and is a member of the national body. All the plumbers in the city, with one exception, are members and now a set of plumbing regulations are before the City Council that are likely to be adopted and which it is believed will be of great benefit to the city at large.

GEORGE BISHOP of the plumbing class of '93 of the Pratt Institute of Brooklyn has succeeded his father at 205 South street, New York. He passed the examination before the New York examining board. He has a contract for plumbing on the new cruisers being constructed by the United States Government.

AN ATTEMPT is being made to evade the Massachusetts plumbing law by a journeyman plumber buying his material of some master plumber who will file specifications of the work and enable the journeyman to do the work at the cost of his wages. This plan comes from Waltham, but it is hardly probable that the journeyman plumbers as a body will approve of any such scheme.

A FIRE in the basement of Allen Black's plumbing and gas fitting establishment, 317 Minnesota street, St. Paul, Minn., last week, resulted in a loss of $2700, fully covered by insurance.

ARCHIBALD BUCHANAN of the Pratt Institute, Brooklyn, plumbing class of '92 has entered into partnership with his father on Fulton street, Brooklyn.

EDWARD LAWLOR, Hartford, Conn., has not confined himself to plumbing alone, but has taken out some patents on inventions, one of which is for a regulating gas burner.

J. J. WADE of Chicago, who learned his trade at Hartford, Conn., was one of the guests at the recent plumbers' convention of the State Master Plumbers.

LANGDON & DALEY, Hartford, Conn., are a firm of plumbers who started in the fall and have done the plumbing work in a number of residences.

R. S SCHADD & BROTHER, steam fitters and plumbers, have leased for three years the store at the northeast corner of the diamond, and will have the same fixed up as a show room, while a workshop will be arranged in the basement.

JOHN F. BRADY, a Bridgeport, Conn., plumber, was recently hurt in a runaway, Mr. Brady being thrown out of the sleigh.

THE NEW PLUMBING FIRM of Ames & Sheffield have opened a store at 151 Main street, Waterville, Maine, and keep a good supply of bathtubs, plumbing materials, &c. Mr. Sheffield has had an experience of 17 years in the plumbing business.

S. S. CHAPMAN, who takes the Western circuit for Meriden Malleable Iron Company, Meriden, Conn., has started out with their large line of plumbers' goods, which embraces a variety of brass brackets and slab supports.

A SYSTEM OF coin-in-the-slot gas meters, by which a stated number of feet of gas are supplied on the insertion of a coin in the meter, is being introduced in New York City by the Consolidated Gas Company. The plan has already achieved success in England, where it has been in use during the past year.

THE BOARD OF HEALTH of Los Angeles, Cal., have approved a set of plumbing regulations and recommended them to the Council for adoption.

JUNE 19, 20 and 21 have been selected by both the Master Steam and Hot Water Fitters' Association of the United States and the National Association of Master Plumbers for holding their conventions, the former being at New York and the latter at Detroit. Many would like to attend both conventions as they did last year, but this is now impossible.

AT THE ANNUAL MEETING of the Master Plumbers' Association of Buffalo, N Y., held at the Builders' Exchange February 14, the following officers were elected: President, J. S. Stygall, Jr.; vice president, S. B. Stewart; secretary, Frank L. Beyer; treasurer, Charles F. Mensch. Trustees: C. Brenner, Edward L. Cook, George Engel.

C. J. LEARY, Monson, Mass., is to build a new store for his stove, tin and plumbing business.

James Meathe, president of the Detroit, Mich., Association of Master Plumbers, was a delegate to the convention of the National Association of Builders, at Boston, and was elected second vice-president.

Frank M. Palmatier, Cobleskill, N. Y., informs us that he has no intention of changing his business location, as has been reported.

E. J. Brady, 58 Warren street, New York, has added gas fixtures to the line of goods he handles in connection with his plumbing business.

It is reported that some plumbers get the best of the city of Chicago by clubbing together and raising the necessary $25 to procure a license, which is taken out in the name of one man and whose name appears as running as many as 30 shops, so that all do business under one license and effect a substantial saving.

Michael F. Carmody, plumber, has moved to the Stevenson Building, 7 North Fourth avenue, Mt. Vernon, N. Y.

John M. Thompson, a plumber and gas fitter, until recently in the employ of Jos. Johnston's Sons, will start a general jobbing shop on Washington avenue, Washington, N. J.

One of the delegates to the Ohio State Convention of Master Plumbers from Canton had a piece of common tin pipe—eave troughing pipe—that was made in the shape of a trap, which had been placed in a costly building in that town and palmed off on the owner as a first-class job of plumbing.

The plumbing trade will be pained to hear of the death of Lawrence Shuster, Jr., of the Shuster Foundry, Philadelphia, makers of Shuster's Sure Seal specialties. Mr. Shuster died at his home in Philadelphia on the 19th inst. We hope to present a sketch of his life in our next issue.

The Chicago master plumbers held a special meeting at their rooms, 197 Madison street, Friday evening, February 16. After due discussion the motion to adopt the apprenticeship code was not concurred in.

James Hastings, plumber, Newburg, N. Y., had made extensive alterations and improvements in his store. Among the specialties shown is a new mode of ventilating waste pipes.

Steel Wire Pipe Hooks.

The cuts here shown illustrate steel wire pipe hooks and methods of using them, as offered by John W. Bell &

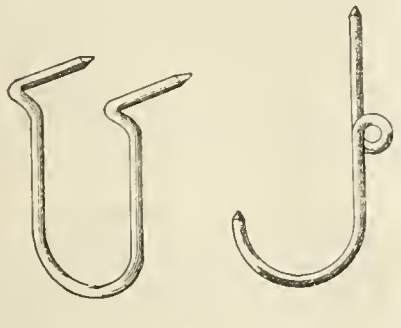

Fig. 1.—Steel Wire Pipe Hooks.

Co., Mercer, Pa. In Fig. 1 the two styles are shown — staple and open hooks. It is stated that the hooks are made of a superior quality of steel wire, tough yet stiff, and that they can be

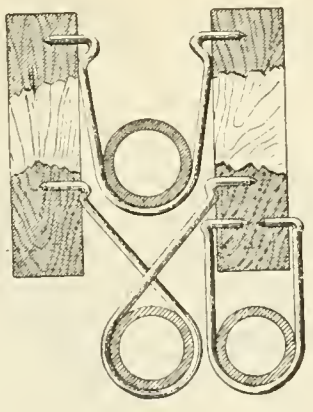

Fig. 2.—Methods of Using Hooks.

driven into any material into which a wire nail would drive. It is explained that the hooks are neat and strong, and that they can be used in many ways which will be suggested to the practical workman by the peculiar circumstances of each particular case. The hooks are designed for fastening gas, water, steam and soil pipe, and are made to suit pipe from ⅜-inch to 8 inches, and of various lengths, the size of wire used varying according to the size of the hook.

The firm of Collins & Dunwoody, tinsmiths and plumbers, Waterford, N. Y., was dissolved February 18. Mr. Collins will continue the business.

At a meeting of the Master Plumbers' Association of Poughkeepsie, N. Y., held on February 19, the following officers were elected: President, P. C. Doherty; vice-president, William H. Ritter; treasurer, Peter Adriance; secretary, William Ward. Delegates to State convention: P. C. Doherty, Thomas A. Waters, Henry J. Maar, Charles Cooke. Alternates: Charles H. Shurter, William Ward and William H. Ritter.

New and Notes.

From Ottawa, Canada, it is officially announced that the Dominion Government has decided to discontinue after March 1 the payment of bonuses to European immigrants taking up land in the Canadian Northwest. It has not been found that the system has had any appreciable effect in inducing immigration.

Over $1,000,000 of the capital stock of the Old Colony and Interior Canal Company has been subscribed for, but ground will not be broken until $2,000,000 is subscribed, so as to insure the plans for the new Cape Cod Canal being fully carried out. It is expected that the work will be completed within two years.

It is announced that the original copy of the Declaration of Independence, preserved in Washington, will no longer be placed on public view. It has been found that the text of the document is gradually fading from exposure. Not long ago it was discovered that a similar cause had rendered the original charter of the Commonwealth of Massachusetts almost illegible.

Captain McDougall, the inventor of the whaleback type of vessel, has submitted plans to the Government for a whaleback war ship. It is reported that the idea is likely to be tried on the lakes by the construction of an experimental vessel of this type.

A boom in Mexican coffee lands is in progress. Millions of acres are said to have been acquired by American and English speculators.

A bill, promoted by the Produce Exchange of New York City, has been introduced into the State legislature calling for an appropriation of $1,000,000 for the improvement of canals.

Secretary Carlisle is credited with the purpose of doing away with the illumination of the Statue of Liberty in New York harbor for reasons of economy. It is claimed that the lights on the statue, which cost the government $10,000 a year, are not necessary for pilotage purposes. In shipping circles, however, the proposal meets with much disfavor, and it is generally hoped that this economy will not be pressed.

Scarcity of fuel caused much suffering and many deaths among the settlers in Western Kansas and the adjoining Territories during the late severe weather. Some of the railroads have offered to convey coal free to the districts where the greatest destitution prevails.

A New York wrecking firm has made an offer to the Navy Department to save the wreck of the corvette "Kearsarge," now lying on Roncador Reef. Nothing will be done, however, in the matter until the arrival of Admiral Stanton and the late officers and crew of the vessel, who are expected home this week.

France's foreign trade has fallen off to the amount of $228,480,000 in the last two years. The returns for 1893 show, for that year, a decrease in imports of $48,257,000 and in exports of $48,695,000.

The Architectural League of New York City, at a meeting held last week, supported a motion, introduced by the president of the league, condemning the erection of sky-scraping buildings, on hygienic grounds, and also on account of their inherent ugliness. They will draft a bill for introduction in the legislature dealing with these structures.

It is rumored that the Stability Board, of which Admiral Walker is head, and which was originally formed to inquire into the faults in some of the new war vessels, will be retained as a permanent feature of the Navy Department.

A recent estimate of the unmined anthracite coal of Pennsylvania places it at 4,000,000,000 tons. Of this total the Reading coal fields are credited with more than one half.

The Riverside Association of New York City has taken a sensible step toward providing work for the unemployed by addressing a letter to all householders on the west side, urging the execution of necessary repairs on their houses now, instead of putting off the work until the summer. They have, moreover, created a labor exchange, where people who have work to be done can secure trustworthy men to do it.

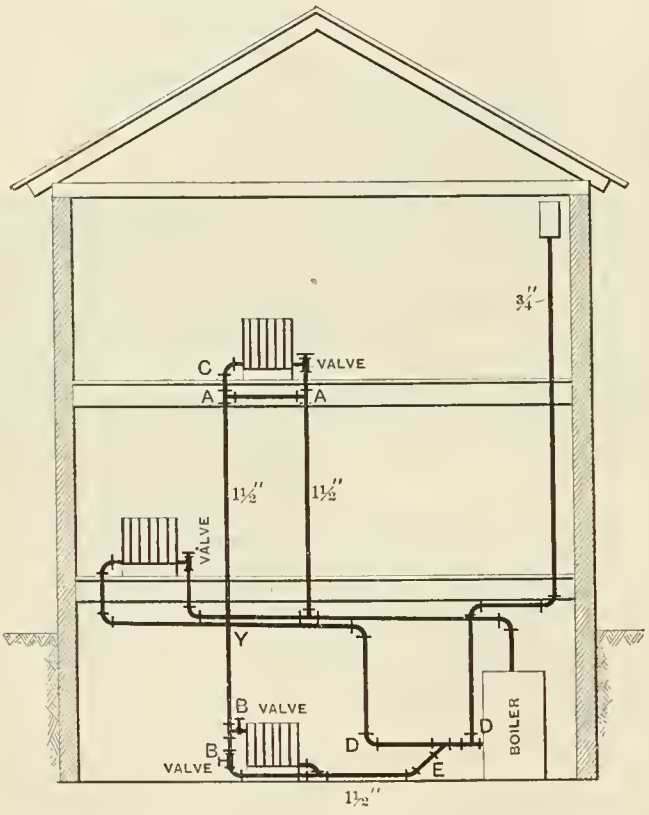
STEAM AND HOT WATER.

Radiator on Boiler Level.

The following letter is received from J. J. Wilson, heating engineer, with the Fuller & Warren Company, Troy, N. Y.:

In *The Metal Worker* of January 27 I notice a plan of heating radiator at boiler level, by A. C. Edgar, Philadelphia. The plan followed is to be commended for the minimum amount of pipe used. I, however, desire to call attention to a couple of changes which I think would insure a more perfect working job. In Fig. 1 of the accompanying illustrations, at point marked A A, where the by pass between the flow and return pipes on radiator on top floor is used as a syphon, when the radiator is closed there is no relief for air, which will surely collect when radiator is cut off. At point marked Y on the return pipe from radiator on top floor a better arrangement of pipe can be made. Fig. 2 explains my method of connecting syphon with air relief, which can be carried to tank, connected to air relief of the radiator, or be brought up by the side of radiator, with an independent air cock. This will prevent air binding and facilitate flow. Fig. 3 shows how branch can be taken off at point marked Y in drawing, Fig. 1, from the return of radiator on top floor and connected to the return of radiator on first floor, dispensing with all pipe below the valve on radiator at boiler level. When it is desired to cut off radiator at boiler level close the radiator valve and open the gate valve on the branch from the return of radiator on top floor. This valve is necessary to prevent water from making short circuit when it is desired to heat radiator at boiler level.

In regard to success in using syphons for heating radiators at boiler level, I have arranged a number of jobs in this way, with four and five radiators at boiler level and all are giving entire satisfaction. These jobs are in the cold climates of the Eastern and Western States. I have two combinations in a large barrel factory near New York.



Radiator at Boiler Level.—Fig. 1.—General Arrangement.

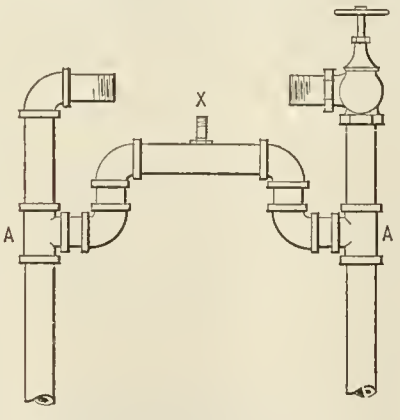


Fig. 2.—Proposed Change Under Hightest Radiator.

The warm air is used to heat the shops and the hot water is used in coils, placed in vats of water to warm same for soaking barrel hoops. These coils are at least 3 feet below the boiler level, and at point where the return turns up to enter the boiler the distance is fully 4 feet below boiler level; yet I am able to maintain a strong and positive circulation. A peculiar feature of this work is that the expansion tank is on the main flow pipe, the work not being done on a syphon. In using a syphon it is far preferable to carry air relief to expansion tank, connecting by a tee with air relief pipe of tank, instead of connecting tank direct to syphon, as this often causes boiling and overflowing of water in tank, requiring extra attention in the matter of supplying water to the system. The above plans can be used for general system of work in *The Metal Worker* of January 20.

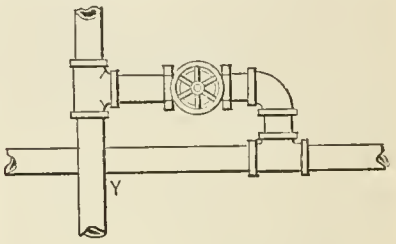

Fig. 3.—Proposed Change in Return.

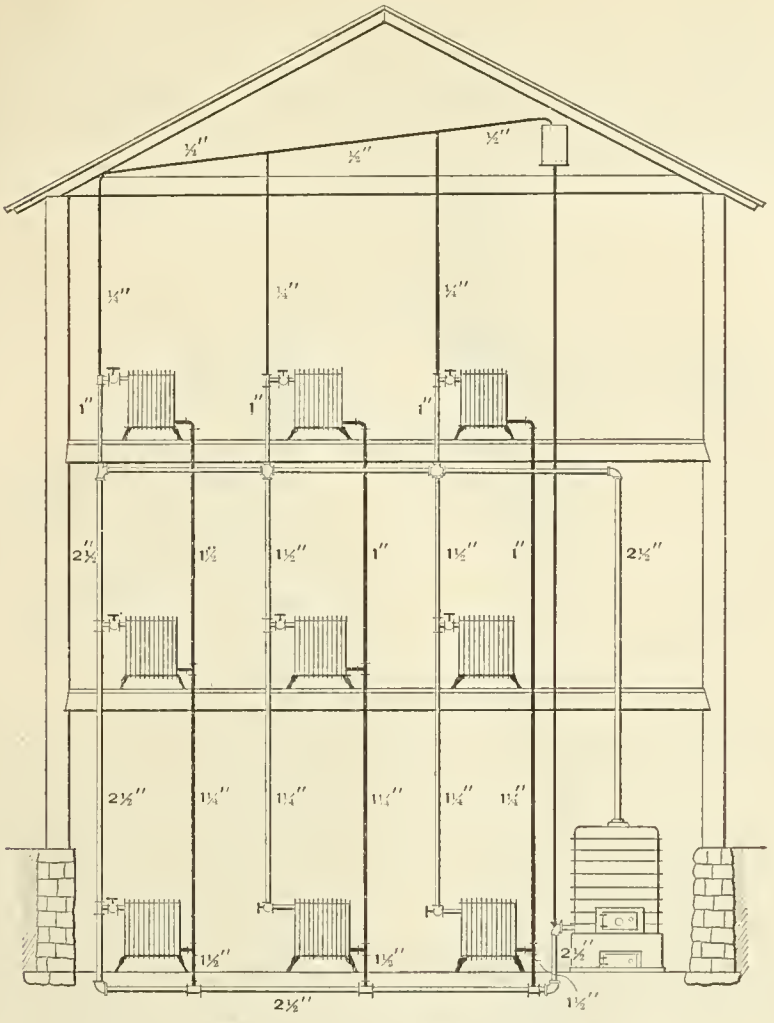
Piping a Hot Water Job.

From W. M., *Titusville Pa.*—I submit Fig. 1 as a better plan, I think, to connect the radiators with the boiler than the one shown in *The Metal Worker* of January 20, in reply to "R. E. M." of Philadelphia, Pa.

Fig. 2 shows a plant that I put in a house three years ago, which shows that my plan may be extended and adopted to suit any condition that is liable to occur, and while I have never put the plan to any test further than is shown, I would not hesitate to extend the system as far below the boiler as it is above, and feel confident of getting a good circulation. The apparatus has been in use three years and under my own observation all the time; in fact the main object of putting it in was to watch for and remedy the defects. I have found none yet, and as for economy in fuel and attention, and for a house of this class, it is far ahead of anything I have ever seen. There is only a difference of from 10° to 12° in temperature in the main pipe at B and A, and the two stacks of indirects, of 80 feet each, shown under the parlor and hall floor, are within 8° of being as warm as the direct radiators on second floor.

HEATING NOTES.

George B. Cobb & Co. announce, under date of February 19, that they have removed their business office from 42 Duane street to 96 Centre street, New York. They propose to use their former store entirely as a workshop, which additional facilities to their mechanical department will enable them to handle their increasing business better than heretofore. The removal



Piping a Hot Water Job.—Fig. 1.—Showing Suggested Plan.

notice accompanies a catalogue that they issue in the interests of the Florida system of heating. The circular, of oblong shape, is neatly bound and published and begins with an interesting dissertation on the several artificial modes of heating, ending up with pointing out the particular advantages of the steam and hot water heating systems. Following this are engravings of some handsome buildings that have been heated by Cobb & Co., while at the close is information that will be read with profit by all who are concerned with the business of warming buildings. In referring to the annoyance often caused by the snapping and hammering sounds from heating apparatus, the author of the catalogue says, very cleverly: "This is simply a vigorous protest of the dumb apparatus against the workmen who erected it, as it is the best evidence in the world that the apparatus is not properly erected and is entirely the fault of the constructing engineer or his men."

JOHN TOWLE AND R. REED of the H. B. Smith Company, Westfield, Mass., were in Hartford, Conn., during the plumbers' convention renewing acquaintances.

BARLOW, BROS., Waterbury, Conn., are showing a 127 Victor for hot water to customers interested in heating. They have installed a number of satisfactory heating plants during the season.

DAVIS, WRIGHT & Co., Keene, N. H., are rearranging their sample room, showing a 317 Richmond for hot water and a 44 Victor, a 21 Richmond and a 320 Richmond Sectional for steam.

G. M. DAVIS & Co., Chicago, manufacturers of steam heating and regulating specialties, have recently moved their Eastern office to 136 Liberty street, New York, and are issuing a catalogue of their goods.

THE PHEASY TUBULAR BOILER COMPANY are to be organized in Cleveland, Ohio, and, it is reported, with a capital stock of $100,000. Thomas Pheasy has invented a new horizontal tubular low pressure boiler for residence and greenhouse heating. The first boiler built has been tested in the private greenhouse of F. E. Dellenbaugh, and found to be a success. The stock company are to be formed and extensive works erected in Cleveland for the purpose of manufacturing the boiler.

H. GILBERT HART of Hart & Crouse, Utica, N. Y., spent a few days this week in New York, making his headquarters with W. M. Mackay, at 211 Water street, where the Royal line of heating apparatus is displayed.

THE WELLS & NEWTON COMPANY, Chicago, have moved into their new office at 274 Dearborn street, Monadnock Block.

H. P. BLAIR and D. A. WESTBURY have formed a partnership under the name of H. P. Blair & Co., and have rented the store at 118 Colfax avenue, South Bend., Ind. The firm will do a general business of ventilating, steam and hot water heating, and deal in gas fitters', plumbers', machinists' and engineers' supplies.

THE ATLANTIC AUTOMATIC GAS HEATING & REGULATING COMPANY, Camden, N. J., with Philadelphia office at 403 Market street, distribute circulars illustrating and describing the Ware automatic gas heat generator and regulator, also the Ware automatic fuel gas controller, as well as Ware's

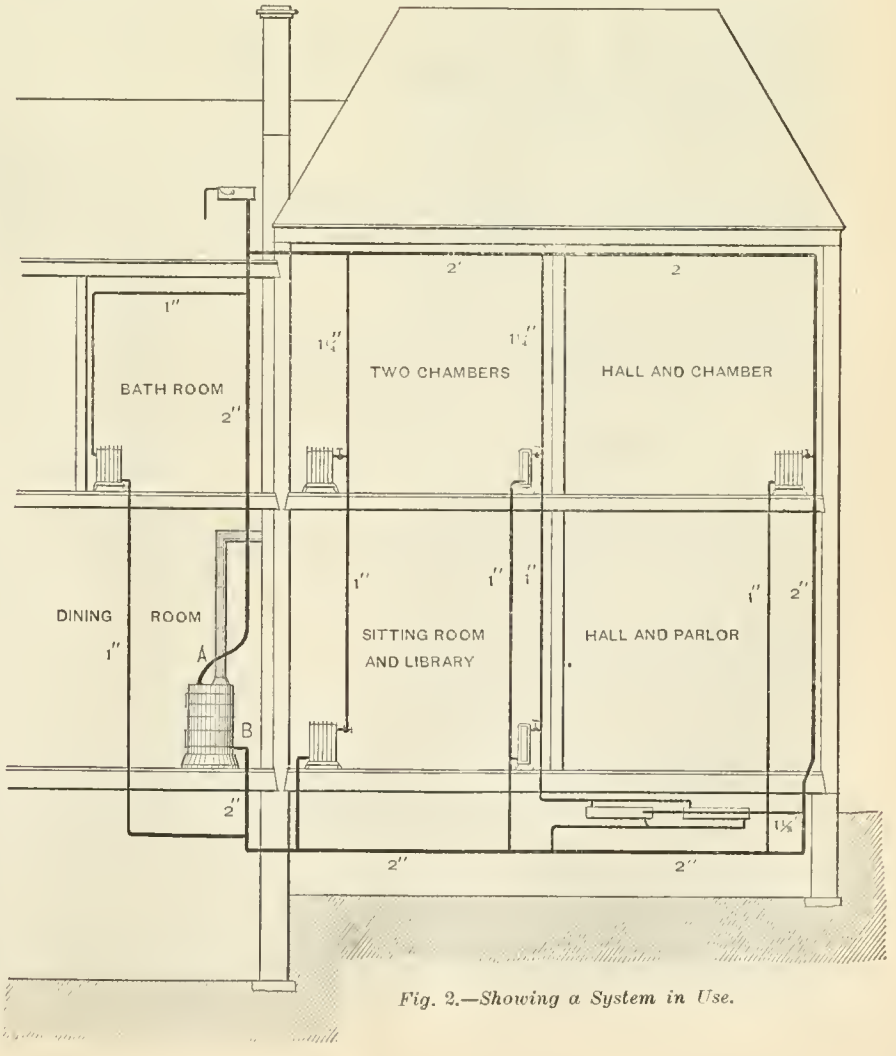


Fig. 2.—Showing a System in Use.

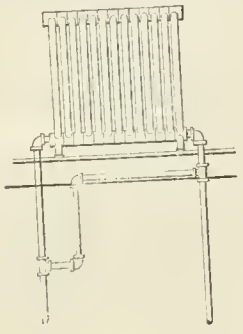
improved thermostat and thermotic circuit closer. The apparatus are illustrated and described in the circular, and on a separate sheet a calculation is presented that will interest those who are concerned with heating apparatus.

W. C. HIGGINS of the Richmond Stove Company, Norwich, Conn., was the guest of A. S. Mappett and Albert Cryer & Co., 85 Center street, New York, last Wednesday and was well pleased with the display made of the Richmond and Victor steam and hot water apparatus.

Cold Water Checked by Hot.

From M. M. W., *New York.*—Having read with interest the comments in *The Metal Worker* on "Piping a Hot Water

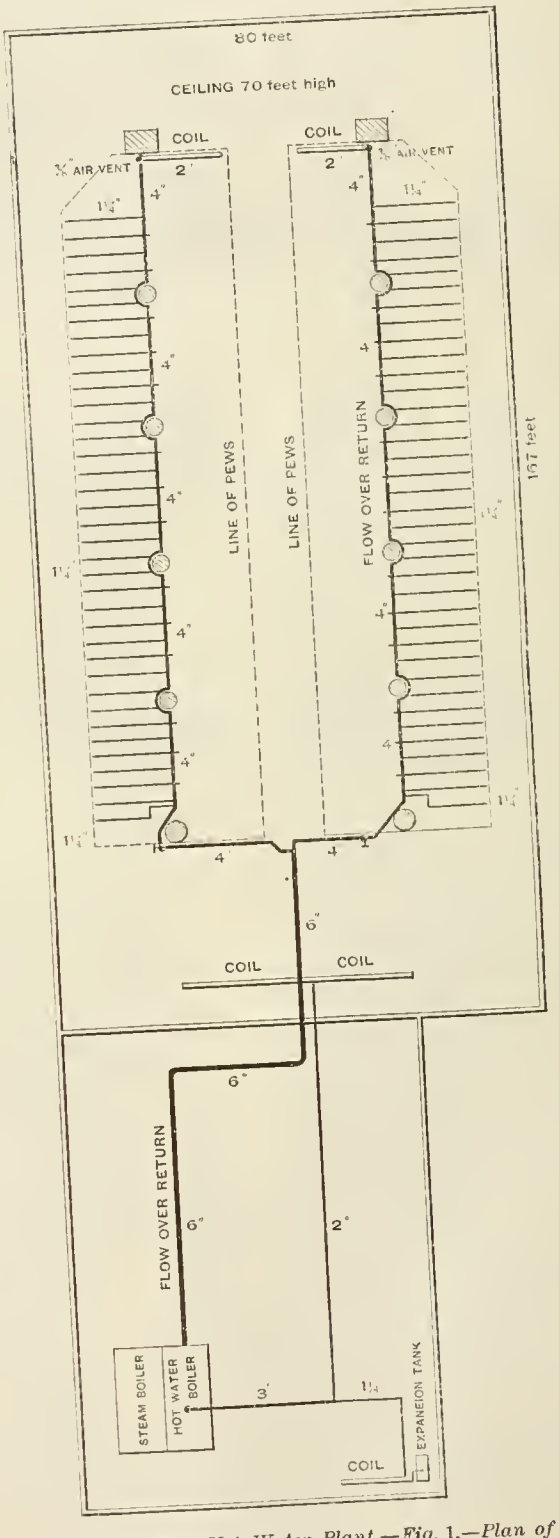


Cold Water Checked by Hot.

Job" and "Radiator on Boiler Level," I contribute this item from my experience. I have found the end loops of a radiator hot and the center loops cold when the flow and return were connected just below the radiator. This, I believe, is due to hot water holding the cold water in check, which possibility is disputed by some. In operation the hot water passes up the pipe into the radiator, but the movement is not fast enough to take care of all of the hot supply, so some runs through the connection below the radiator and enters the radiator at the return end. Such an action interferes with the heating of the radiator and causes dissatisfaction. I have remedied such troubles by connecting, as shown in the illustration, the drop in the cross connection before it receives the return from the radiator, preventing the cold water being held in check by the hot water.

An Interesting Hot Water Plant.

Owing to the lack of heat and excess of noise from the steam heating plant in the Church of the Most Holy Redeemer, at 173 East Third street, New York, an effort was made to secure something more satisfactory. On consulting W. M. Mackay, 211 Water street, New York, the plant here illustrated and described was decided upon and installed by Albert A. Cryer & Co., 85 Centre street. Under a building adjoining the church there were two 40 horse-power steam heating boilers, one intended for heating the church and the other the school and residence connected with it, but in cold weather both had failed to make the church comfortable. One of the boilers is now used as a hot water apparatus, as shown in Fig. 1, with a 6-inch flow pipe taken from the back of the boiler and run to a point under the church, where it rises and branches, as shown, into two 4 inch flow mains, one running to each side of the church. To economize space these mains pass beneath the partitions between the pews and had to run around five pillars 30 inches in diameter and extending across two pews. A special casting, shown in Fig. 2, was made to meet this requirement, having a 4-inch waterway, a 1¼-inch outlet on the side, and flanges on the ends for joining together and connecting with the pipes, two castings being necessary to pass the pillar. The main flow throughout the plant is directly above the return, and as both had to be placed below the seats, they are run nearly level, the flow having a slight fall from the first pillar and the return having a slight fall toward the boiler. From alternate crosses and tees in the mains and openings in the pillar castings a 1¼-inch pipe runs, with all from the main, under the seats of the outer row of pews, and the return, instead of being beneath, is alongside of the main, with a slight fall toward the return main, until it nearly reaches it, when it drops down and connects. This arrangement of the piping was necessary to avoid interfering with the feet of the kneeling worshipers. The crosses are plugged, and were used so that more heating surface could be added if found necessary. The flow mains terminate in 2-inch coils, 6 tiers high, behind the middle pews at the entrance of the church, as shown in Fig. 1, and connect with the return main. From the top of the coils ¾-inch pipes run up, behind an arch, with an open end to a point above the level of the expansion tank, afford-



An Interesting Hot Water Plant.—Fig. 1.—Plan of Church.

ing an air vent for the system, so that no air valves are used. The pipes beneath the seats are supported by a hanger, shown in Fig. 3, and were adjusted by placing a piece of wood of the proper thickness between the hanger and the

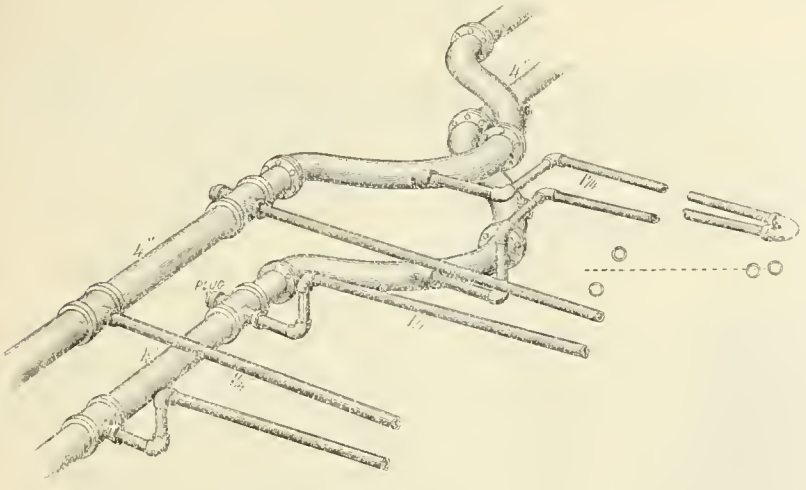


Fig. 2.—Flow and Return Mains Around Pillar.

seat. Referring again to Fig. 1, it will be noticed that a second 3-inch main runs from the top of the boiler and branches, a 2-inch pipe running to a coil behind the altar and a 1¼-inch pipe running to a coil in another building, to which the expansion tank is connected. As soon as circulation begins in the 4-inch flow mains under the partitions, the almost imperceptible decline, and the gradual cooling of the water makes the entire system a return and with a temperature of 160° at the boiler the whole church is satisfactorily warmed and a substantial saving in labor and fuel effected. In addition to 200 feet of 6-inch pipe

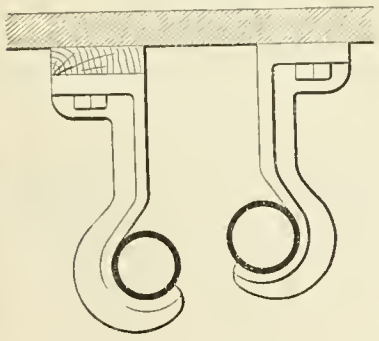

Fig. 3.—Pipe Hanger.

used in the flow and return about 400 feet of 4-inch, 300 feet of 2-inch and 2000 feet of 1¼-inch pipe are used for radiation. The successful heating of so large a church with so many obstacles and so little pitch makes the plant and the method of its installation of more than ordinary interest.

The Smith & Winchester Company of Boston, Mass., are about to place a new steam and hot water heater on the market for the coming season, and have adopted a novel way for selecting the name. The company are sending out circulars to get the opinions of all the trade upon the most suitable name. The suggestions will be submitted to a board of judges, consisting of L. A. Hart, manager of *Heating and Ventilation*, the editor of *The Metal Worker* and E. R. Pierce, manager of the Boston office of the American Radiator Company. The contest will close March 15, 1894, and the person selecting the name decided upon by the judges will be presented with one of the new heaters for steam or hot water.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

David Horn, 211 West Market street, York, Pa., has been awarded the contract for the plumbing, tiling, tin and copper work for the new building of the Security Title & Trust Company, in that city.

The contract for heating the Agricultural Building, including the museum, at Raleigh, N. C., has been awarded to Allen & Cram of that city.

The Vanderman Plumbing & Heating Company, Willimantic, Conn., are installing the heating plant in the Normal School of that city, using the blower system and two 60 horse-power boilers. They are doing the plumbing and heating in the Murray Block, using a 60 horse-power boiler.

Ernest Franz will erect a three-story and basement flat building at 4217 Wabash avenue, Chicago, covering an area of 22 x 60 feet. It will have walls of stone and brick, plate glass, lavatories, hardwood finish, mantels, bells and modern plumbing. It will cost $9000.

Sidney S. Niles will erect a three-store and flat building, 25 x 65 feet, on South boulevard, in Oak Park, Chicago. It will be heated by steam and lighted by electricity. It will cost $10,000.

The Easton Heating & Ventilating Company, Easton, Pa., were awarded the contract at $412 to install a hot water heating plant in Engine House No. 3 of that city.

W. E. Bouillon, Lincoln, Ill., has been awarded the contract for fitting up the second floor of Casey's Building with the latest and best plumbing fixtures.

Trimble & Lutz, Wheeling, W. Va., have recently completed a heating and plumbing contract of $66,000 in the new hospital for the insane at Spencer. The plumbing is complete and efficient, a feature being catch basins in the drains for the removal of articles that may be put in the fixtures by the patients.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until March 14, for work including plumbing and conduits for electrical wires in the United States Post Office building at Staunton, Va. Drawings and specifications can be obtained from the Supervising Architect, at Washington, or may be had from the superintendent at Staunton, Va.

Some of the recent contracts closed by Thomas Weathered's Sons, 244 Canal street, New York, are for the erection and heating of a $7500 greenhouse for J. C. Hoagland, Seabright, N. J.; two greenhouses, one 100 feet and the other 80 feet long, for Waldemar Barth, Bayone, N. J., and rearranging the heating plant and installing one of their No. 6 boilers in the conservatories of Mrs. J. C. Meyers, Yonkers, N. Y. They are also building a conservatory for Gen. John B. Woodward of Brooklyn, N. Y.

The D. F. Morgan Boiler Company, 23–25 West Lake street, Chicago, are overhauling the steam heating plant in the building to be occupied by the Iroquois Club, Michigan avenue and Adams street.

The Taylor School, Augusta street, near Noble, is to be supplied with a direct and indirect steam heating plant and fan system of ventilation by the Kelly & Jones Company, 48–52 North Clinton street, Chicago.

T. C. Boyd, 42 Dearborn street, Chicago, is completing the plumbing, gas fitting and sewerage work in the residence of Geo. L. Petersen, 599 Pine Grove avenue.

Peck Bros. & Co., 259 Wabash avenue, Chicago, have just furnished their Boyd lavatories, triple jet closets and porcelain baths for J. B. Scott's residence, 410 Ashland avenue. The firm report a steady increase in the use of their corrugated soil pipe for first-class work.

E. Baggot, 169–171 Adams street, Chicago, is to furnish the plumbing, gas fitting and sewerage for the flat building of F. J. Urson, 3554 Cottage Grove avenue.

The Kewanee Boiler Company, 96 Lake street, Chicago, have furnished one No. 12½ Haxtun boiler to be used in the Menoken Club House. The Samuel I. Pope Company, 360–364 Dearborn street, do the steam fitting.

The J. L. Mott Iron Works, 311–313 Wabash avenue, Chicago, are to supply a large Sunray heater and necessary radiation for heating the new hotel at Evanston, Ill.

August Deschler, Chillicothe, Ohio, has secured the contract for heating by steam the First Presbyterian Church. A Florida heavy duty heater, manufactured by the American Boiler Company, is to be used.

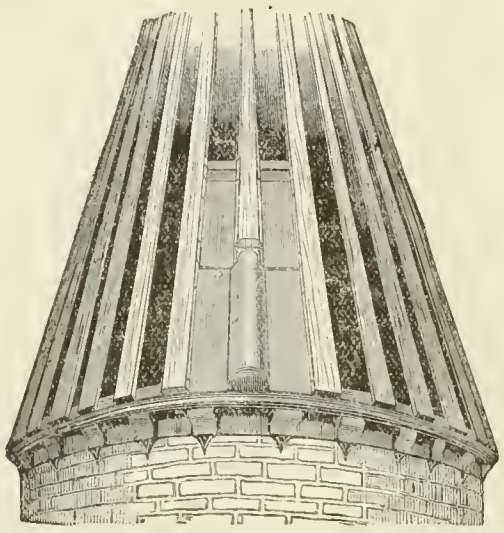
The contract for heating the new Masonic Temple, Richmond, Ind., has been let to McGinnis, Smith & Co., Pittsburgh, Pa., their bid for the work being $2700.

Sealed proposals will be received at the office of the Superintendent of Public Buildings, Lowell, Mass., until March 9, for the heating and ventilating of the four-room addition to the Butler School building.

ROOFING AND CORNICE.

Merchant's Graduated Tiles.

We show in the accompanying illustrations views of a graduated metal tile of Spanish pattern that is being put on the market by Merchant & Co., Incorporated, Philadelphia. The graduated tile are so made that parts for any tower of whatever inclination or pitch may be selected from a few stock patterns. Each tile consists of two parts, known as the round section and the flat section. In laying, the circumference of a conical roof is divided into the same number of spaces as it is desired to have courses of tile. Tapering strips of wood are then nailed on the sheeting boards from eaves to apex, as shown in Fig. 1. These strips taper in width and also vary in thickness, and are arranged to fit inside the curved portion of the tile shown in Fig. 4. The curved tile are made with appropriate taper in each section and with ears at the upper end for bending down and nailing to the wooden strips. There are also interlocking flanges which connect one section with another in a telescopic joint. The flat tile are first put in place between the wooden strips, as shown in Fig. 1, and nailed through the flanges to the tapering strips. The flat tile are sent out with only one edge bent, as in Fig. 2, the other being bent as required (see Fig. 3) by the person laying the tile, the bending being done with ordinary tongs. After the flat part is in position the round part is put in place, the successive courses being applied and interlocked. Messrs. Merchant & Co. are making at present 32 sizes of this tile, and will supply on short notice the covering for any tower of which correct dimensions are supplied them. They send with each order a specification of the wood strips, giving width of bottom, length and thickness of bottom and thickness of top, together with spaces between strips at the bottom, and indicate the amount of given numbers of tile that will be required for the several courses, the tiles having their numbers stamped on them.



Merchant's Graduated Tile.—Fig. 1.—Tower with Wood Strips for Laying Graduated Tiles.

Fig. 2.—Graduated Flat Tile with One Edge Turned.

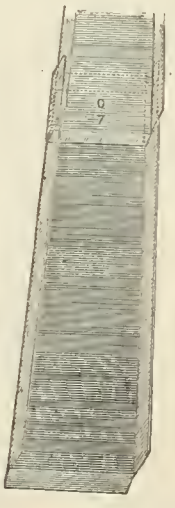


Fig. 3.—Graduated Flat Tile with Both Edges Turned.

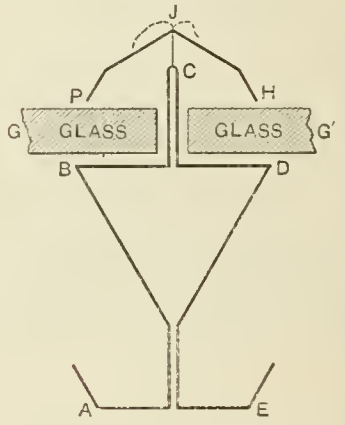
Fig. 4.—Graduated Round Tile.

Water Tight Connection for Skylight Glass.

From G. M., *Camden, N. J.*—I am about to construct a sheet metal skylight, and would like a little information on making a water tight connection between the edges of the glass and the metal.

Answer.—The connections between the glass and metal in skylight work are made by means of putty, rubber or sheet lead. The latter method was shown in *The Metal Worker* of December 2. The manner of securing the glass to one of the side bars of a skylight, putty being used for the purpose, is shown in Fig. 1. In this figure, A B C D E represents the bar, P H the covering cap and G G' the glass. The covering cap is secured to the bar by means of a doubled strip of copper, C J, which is fastened to the bar, passes through a slot cut in the cap, and is



Water Tight Connection for Skylight Glass.—Fig. 1.—Method of Securing Glass to Side Bar.

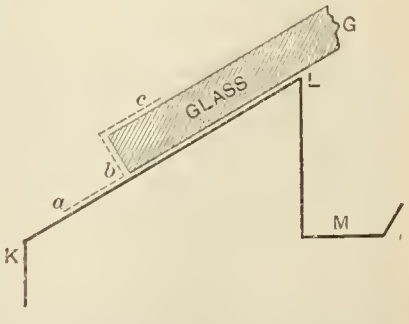


Fig. 2.—Securing Glass at Curb.

bent over in opposite directions, as shown at J, thus holding the cap in position. The putty is placed between the glass and bar, as shown at B D, and makes a water tight joint at this part of the structure.

The curb of skylight can be made in any convenient shape, or as shown by K L M in Fig. 2. The trough M receives the drip from glass and side bars,

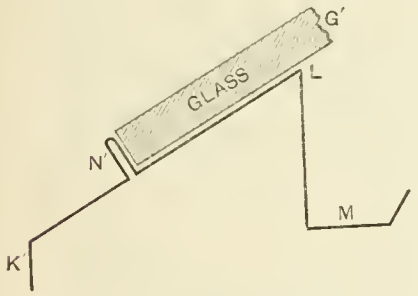

Fig. 3.—Second Method of Securing Glass at Curb.

and can be extended through the sides of skylight, thus allowing the condensed moisture to escape. To prevent the glass from slipping down, strips of copper can be fastened to the curb and bent over the glass, as shown at *a b c*. Putty is also to be placed between the glass and curb. Another method of holding the glass in position at curb is shown in Fig. 3. The curb is formed as indicated at N', thus securing the desired result. The manner of joining the glass to ridge bar is shown in Fig. 4. Putty is placed between ridge and

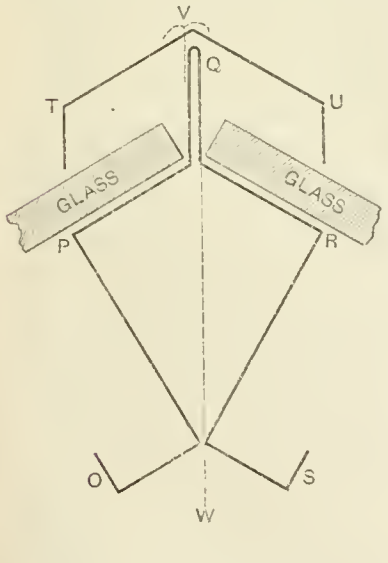

Fig. 4.—Securing Glass at Ridge.

glass, as indicated at P R, and the cap placed over and secured by the doubled copper strip Q V, which passes through a slot in cap and is bent over as shown at V, thus securing the cap in position. If the skylight was to be made with a single pitch only half of the ridge bar would be required, and could be formed as indicated by O P Q W, Q W forming the upper part of the skylight.

FLASHINGS.

The Expanded Metal Fire Proof Construction Company of New York City, with a capital of $50,000, were recently incorporated. The directors are John F. Golding of Chicago, John H. Parker, Joseph H. Combs, Martin S. Mosher and Wm. P. Testevin of New York City.

Disley & Weinand, Waterbury, Conn , have done the sheet metal, cornice and skylight work on a number of buildings recently, among which are the State Normal School at Willimantic, Christ Church at Ansonia, Library Building at Naugatuck and the Telephone Building at Waterbury.

Notice is issued to the trade under date of February 14, by Schmidt & Weitzel, 106 Builders' Exchange, Cincinnati, Ohio, that they now represent in that section the Cincinnati Corrugating Company of Piqua, Ohio. They recommend the use of sheet steel, well painted, as a durable and cheap roof covering, and they will be pleased to furnish estimates on corrugated roofing, siding, ceiling and arches, corrugated lath, shutters and doors, V-crimped and standing seam steel roofing, steel brick facing, weather boarding and beaded metallic ceilings. They make a specialty of sheet metal work of all descriptions and are prepared to estimate on cornice and door caps, hot and cold air pipes, ventilators, &c.

F. J. Geissinger, 1525 Clearfield street, Philadelphia, Pa., distributes an attractive circular addressed to his customers and the public. Mr. Geissinger announces that having purchased a piece of ground 60 x 200 feet he will erect one of the largest and best steam power cornice works in Philadelphia, which he will equip with the latest improved machinery for forming all kinds of sheet metal. His specialties are skylights, sheet iron fronts, awnings, fire door linings, ceilings, bay windows, oriels, &c.

Another enjoyable evening was spent by the students at the New York Trade School last Tuesday, listening to addresses from the following speakers: Robert Rutter, ex-president of the General Society of Mechanics and Tradesmen and a practical bookbinder, clearly described the process of book making, from the time the copy was received until it became a book. John Ward Stimson, principal of the New York Institute of Artist Artisans, urged the young men to call education to their assistance in their trades, in order to rise above being a mere machine. President R. Fulton Cutting spoke of trades unions and their power for good if properly used and their capacity for evil when used for selfish aims.

Steps are being taken for the establishment of a municipal electric light plant in Philadelphia, to be owned and operated by the city on similar lines to the city's gas works.

Germany is beginning to feel the effects of the immigration of pauper aliens into that country. The German Goverment has just issued some strict regulations governing the passage of Russian and other emigrants through the Fatherland on their way to the United States in order to prevent them from settling in Germany.

Water Supply of Albany.

Albany (N. Y.) journals are loud in their complaints of the miserable water supply of that city. The main supply is derived from the Hudson River, and is, it appears, pumped from the intake at the foot of Quackenbush street by a single set of pumps, which are in almost constant use and which have been performing steady service for a number of years. Should this machinery fail, from any cause, coincidently with the outbreak of a fire in the city the possibilities would be dreadful to contemplate. Even under the present "regular" service the odds in favor of the fire appear to be large, judging from the following extract from the account of a recent conflagration in Albany, given by the Albany *Express:* "After a line of hose had been laid and connections had been made, there issued from the nozzle a puny stream about $\frac{1}{3}$ inch in diameter, rising to a hight of about 10 feet. The crowd jeered and hooted while the firemen turned this stream in the direction of the fire, which was merrily blazing 30 or 40 feet above." As an explanation of this failure, the Fire Commissioners are said to claim that the mains conveying the water from the pumping station to the reservoirs are so weakened by rust that almost numberless breaks have occurred, and that to put up extra pumps creating a greater force would cause the pipes to burst. Meanwhile it is understood that new pumping machinery, for which the city has paid $160,000, is lying idle and deteriorating under exposure to the elements.

Shrinkage Rules.

Keuffel & Esser, 127 Fulton street, New York, and 265 State street, Chicago, are manufacturing a boxwood shrinkage rule or scale with brass ends, for the use of pattern makers. It is not offered as a new implement, but as one better made and more accurately graduated than many heretofore made. The purpose of this kind of rule is to enable the workman to so construct a wooden pattern that when the metal pattern is cast from it, when cooled and shrunk will be just the size he originally intended it should be. Having in mind the regular scale of shrinkages of the various metals, the pattern maker, for example, uses a rule ostensibly 2 feet long, but actually 24¼ inches in length. This is subdivided in eighths, tenths, twelfths and sixteenths, so proportioned that the pattern made to this standard will produce a certain metal pattern which, after shrinking, will be the required size. The rules are made in the following lenghts —viz, $24\frac{2}{10}$, 24¼, 24⅜, 25, 25½, 26, 26¾ to 2 feet, and graduated in eighths, tenths, twelfths and sixteenths by machinery. These rules are likewise valuable where double shrinkage must be considered.

Plans have been accepted and work will, it is stated, be immediately begun on the new building for the American Surety Company, at Broadway and Pine street, New York City. It will be another mammoth erection, and will overtop the Manhattan Life's new structure near by, on Broadway, which is one of the tallest houses in existence. The tendency to the erection of "sky scrapers" has become very marked in New York of late years.

TIN PLATES.

The New Castle Steel & Tin Plate Company,

New Castle, Pa., are in operation to their full capacity and shipping their product about as fast as made. At the present time the output of this concern amounts to about 30 tons of black sheets per day, about one-half of this amount being tinned, the balance being sold in the open market. Extensive additions to the plant are now under way, and when these have been completed the capacity for production will have been increased about one-third. This firm make their product from the ore up to the finished material. Their Bessemer billets are obtained from the Shenango Valley Steel Company, an identified interest, whose plant is located only a few hundred feet away, and this insures uniformity of product at all times. The main building of the New Castle Steel & Tin Plate Company is surrounded by an elevated railroad track, and on this is received all the raw material used. In one corner of the building is located a large heating furnace, fired by gas producers. In this furnace the billets are reheated and then taken to the rolls by means of a "telegraph," and after being reduced to the proper dimensions are then taken to what is known as a "bosh." This is a large tank sunk in the floor and filled with water, into which the sheet bars are plunged and cooled, after which they are taken to the shears, situated at the end of the "bosh," when they are sheared to the proper length. This mode of handling the billet until it is put into sheet bars requires only one minute or less, and will permit of the handling of a large amount of steel at a minimum cost. Excellent reports of the quality of the black sheets and also the tin and terne plate made by this concern have been received from customers in different parts of the country, which show that the New Castle Steel & Tin Plate Company have already established an enviable record for their product, second to none in the country.

Assignment of James B. Scott & Co.

Following closely upon the death of James B. Scott of the firm of James B. Scott & Co., tin plate manufacturers at Pittsburgh, came the announcement that the affairs of that firm had been placed in the hands of an assignee. James Collord, a well known iron broker of Pittsburgh, being appointed to that position. The announcement that an assignee had been appointed to take charge of the business of James B. Scott & Co. created considerable surprise in business circles in Pittsburgh, as the firm was generally regarded as a prosperous one, doing a very large business and making money. In explanation of the reasons for taking this step it is stated that the assignment was made pending the settlement of the personal estate of the late James B. Scott. It is further said that the firm is not in the least embarrassed in a financial way, and that despite the depression in trade circles, with its consequent reduction of valuations, it is able to pay all obligations dollar for dollar. It is further said that the past year has been a successful one for the concern, it having made money. The reason for the assignment, it is said, is to protect the firm's creditors and the firm itself from any embarrassments or complications which might arise from claims of the late James B. Scott's personal creditors. Mr. Scott was generally accounted a wealthy man. With the assignment of the firm comes the intimation that the estate of the deceased would now be in a far better condition than it is had he paid more attention to business and less to philanthropy; that if, instead of working in and out of season for the State and for the good of humanity, he had devoted himself more to trade conditions, the making of an assignment by the firm would not have been necessary. It is intimated further that Mr. Scott was made a victim of his own kindness of heart, and reference is made to a recent instance of this, where his indorsement of the paper of a friend who died cost him between $30,000 and $40,000. It is also hinted that there are other like cases. Messrs. A. G. and W. U. Follansbee, surviving partners of James B. Scott & Co., and who have had entire charge of the business affairs of the firm for some years, and through whose efforts the business was brought up to its present proportions and made so profitable, will give their entire attention to the business as formerly, for the benefit of the assignee. It is expected that within a very short time definite information as to the outcome of the affairs of the firm will be ready for the creditors.

SCRAP.

Duquesne Tin Plate Works, Pittsburgh, Pa., have been operating their plant steadily since its inauguration. The capacity of the works is from 150 to 200 boxes daily, and they state that they have enough orders for roofing plates on their books to keep them busy for the next three months.

The sheet mills of the Falcon Iron & Nail Company, Niles, Ohio, are reported as running to full capacity to fill orders, of which enough are now booked to keep the plant busy for some considerable time to come. There is said to be a large and increasing demand for the black plates of light gauge made by this concern for tinning purposes. At the office of the firm's New York agent, George H. Ismon, 277 Broadway, are to be seen some handsome samples of their product, which show that they need not fear comparison with any imported black plates in respect of toughness, ductility, smoothness of surface and general excellence of finish.

Persistent efforts are being made to encourage the cultivation of ramie in the United States, with a view to its use as a textile and for paper making material.

An Exhibit of Canning Machinery.

The very important part now taken by machinery in canning vegetables and fruits was shown last week in Chicago. The occasion was the annual convention of the Canned Goods Association. It was an excellent opportunity to show canners from all parts of the continent the latest devices invented for their benefit, and the manufacturers took advantage of it. They secured a fine large room, with power, on the third floor of the building at 241 to 247 South Jefferson street, allotted the space among themselves and installed their machinery in exposition style, so as to show it in practical operation. The display thus made was extensive and exceedingly interesting, comprising machinery for all purposes in connection with the canning business, beginning with presses for punching can tops and bottoms from tin plate, following that up with coating devices, filling apparatus, machines for soldering tops on cans, machines for gumming labels, &c.

G. A. Crosby & Co. of Chicago occupied a prominent space, exhibiting their No. 45 power press, intended for heavy work, having a bed opening of 8 x 14 inches; their No. 30 press, with a bed opening of 5 x 8 inches, and their No. 16 press, with a bed opening of 3 x 5 inches. A small press was shown which is so constructed that it can be mounted either on legs or on a bench, and either in an upright or an inclined position, and adapted to a great variety of work in sheet metal. They also exhibited a new automatic double headed crimper, which is designed to crimp, at the same time, both ends on to the bodies of round cans. They further showed a new power solder cutter for cutting drop solder. In this machine the bars to be cut are laid on the bed plate and weights hold them tight against a stop piece in front, which is adjustable. As soon as the cut is made the weights feed the bars forward for another cut. All these machines were placed in line and belted from one shaft, making a neat and creditable display.

The Andrews & Johnson Company of Chicago showed the Johnson high speed engine attached to disk fans and blowers.

The Baker Mfg. Company of Muscatine, Iowa, exhibited a fine collection of special machinery suited to the requirements of those who can vegetables and fruits on a large scale. Much of this machinery is massive. The steam process, boxes and horizontal and upright process kettles are as substantial as the ordinary steam boilers. In this display there were steam can cleaners, pea can filling machines, air pumps, enormous tomato cookers, can soldering machines, &c. The machines for soldering can tops are ingeniously constructed, the soldering tool being attached to a swinging arm capable of covering considerable space. The tool is kept heated by gas passing through its interior. The labor saving idea runs through all the machinery made by this company, whose works were founded in 1882 and are now claimed to be the largest in their line in the world, employing upward of 600 men.

Daniel G. Trench & Co. of Chicago, as Western agents for a number of manufacturers, made an excellent display. They showed the Stevens can filler, by Maurice B. Ayars of Salem, N. Y.; the Canadian capping machine corn cutter and corn silker, by Sprague Mfg. Company of Farnham, N. Y.; apple parers and corers, by the Goodell Company of Antrim, N. H.; also the Hawkins capping machine, just brought out.

George H. Colket & Co. of Philadelphia showed their improved Climax capping machine. The Hemingway Mfg. Company of Syracuse, N. Y., exhibited cookers and syruping machines. Frank Diesel of Chicago, can manufacturer, showed a variety of samples of tin cans. Henry B. Keeley of Vinton, Iowa, exhibited the Keeley corn silker. Cox, Bro. & Co. of Bridgeton, N. J., showed a tomato scalder and a capping machine. H. C. Baxter & Co. of Brunswick, Maine, exhibited a corn cooker and filler, corn silker, mixer, wiper, and an air compressor.

The Burt Mfg. Company of Rochester, N. Y., exhibited the Burt kerosene oil system of soldering, which is especially adapted to the use of large factories in which numbers of tinners are employed and a large number of soldering tools must be kept in constant use. They also showed the Burt tray wiper and the Burt topping machine. Included in their display were steel floor trucks and basket trucks manufactured by L. Murray Moore of Rochester.

The Sinclair-Scott Mfg. Company of Baltimore showed pea hullers of large capacity, scalders, can fillers and a variety of other special machines of their own design. They also exhibited the Perfection steam crane and demonstrated its advantages in large canning establishments.

Norton Brothers of Chicago showed their latest capping machine. This is constructed with a workman's bench at each end. The cans pass round the machine on an endless carrier. Both sides of the machine are fitted with automatic solderers, wipers, &c. Each workman takes off two complete cans as they pass in front of him and puts two in their place, and thus each keeps the other supplied with work. The capacity of this machine is 2300 cans per hour.

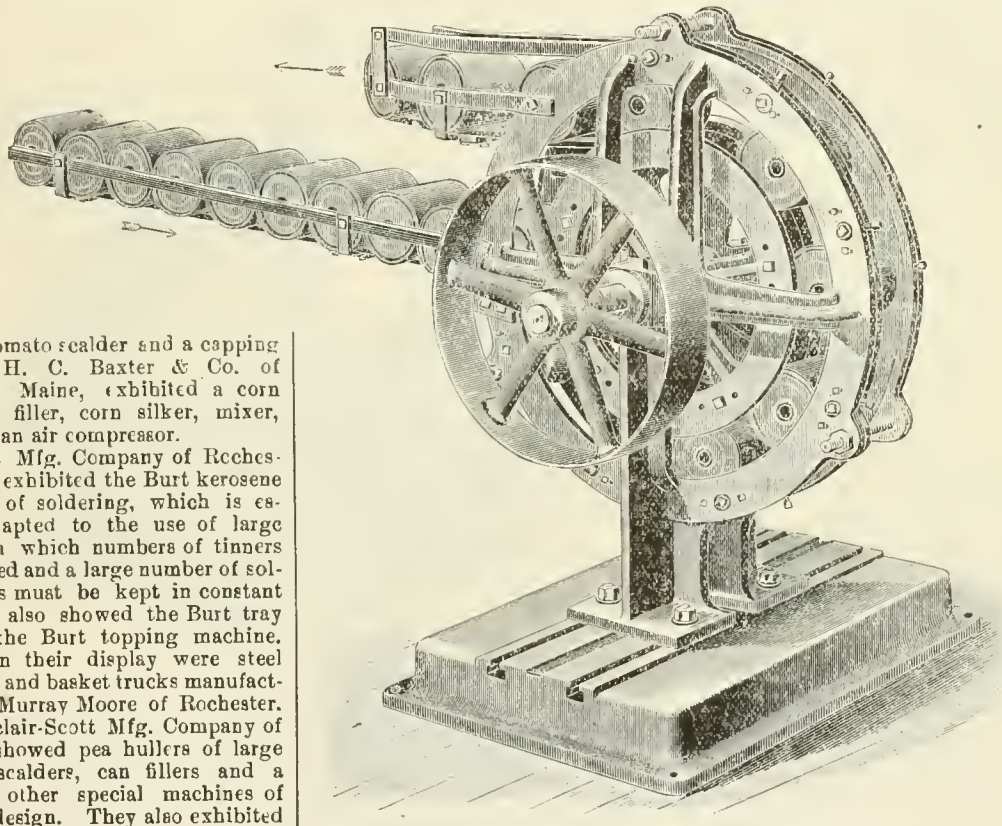
Merrell & Soule of Syracuse, N. Y., exhibited an automatic corn canner, filling considerable floor space, which cooks corn and fills and caps cans in one continuous operation. The Barker Mfg. Company of Portland, Maine, exhibited a power corn cutter, a hand corn cutter and a silker. The Canners' Supply Company of Bridgeton, N. J., showed a power steam scalder. The Bucklin Can Filler Company of Baltimore showed a new can filler. The Xenia Canning Company of Xenia, Ohio, exhibited one of their automatic can fillers, which measures the contents of every can, while it receives, fills and discharges them without any handling whatever. R. O. Conant of Portland, Maine, exhibited a corn cooker. The Hohmann & Maurer Mfg. Company of Brooklyn showed a large line of samples of special thermometers and gauges for use in connection with canning machinery. The Link Belt Machinery Company of Chicago had a representative on the ground with a large number of photographs of factory interiors, showing the company's shafting, pulleys, elevators and conveyors, power transmission, &c.

Not the least interesting feature of the display was the department devoted to labeling machines, for pasting labels on the filled cans. These were shown by the Wight Labeling Machine Company of Boston, the Milwaukee Labeling Machine Company of Milwaukee, and Cornell & Knapp of Adrian, Mich. While the apparatus employed differed in details, the end aimed at by each was to make the machine do as much as possible in handling the cans, applying the paste and attaching the labels.

Among the specialties shown which required no machinery were the following: The Raymond Lead Company of Chicago exhibited solder in all its various forms adapted to canners' use—triangular, wire, segments, drop and bar. E. W. Blatchford & Co. of Chicago also exhibited solder, making a tasteful display of the samples shown. Geo. H. King of Lynn, Mass., exhibited his new Scientific can opener, comprising in the one instrument four can openers for various shapes of cans. The National Key Opening Can Company, Masonic Temple, Chicago, exhibited their latest can opening device for opening cans by rolling the binding strip of metal round a key, thus detaching it from the can and avoiding the use of a can opener. The Morgan Box Machine Company of Rochester, N. Y., exhibited samples of their boxes made with dovetailed corners, claimed to be much stronger and cheaper than nailed boxes.

Patent Automatic Double Headed Crimper.

We present in the accompanying cut an illustration of the new patent automatic double headed crimper manufactured by George A. Crosby & Co. of Chicago, Ill., and which is designed to crimp at the same time both ends on to the bodies of round cans. The crimping is entirely automatic, the cans being fed into the machine and crimped and discharged without handling, the machine having a capacity of 150,000 cans per day of ten hours. The cans with the heads snapped on loosely roll from the feeding trough or chute into the machine and are carried around between two sets of wheels, which set the heads down on the bodies as required and crimp them so that the burrs will either stand out straight against the body of the can or with the burrs curved inwardly or outwardly, as may be desired. After this operation the cans roll out through the discharging trough ready for fluxing. A particular feature of this crimper, and to which the makers invite special attention, is that it does not require the ends to fit the bodies tightly before they enter the machine. The ends may be large enough or the bodies small enough so that they can be snapped on easily and loosely, thus facilitating the operation of handling. The crimper is so constructed as to admit of adjustment for different widths of burrs or different lengths of bodies, but is not adjustable for different sizes of cans. If desired, however, a suitable machine can be built for two different diameters of cans for placing on the same stand. The machine is so arranged that there is comparatively no friction caused by the cans rolling between the wheels, thus, it is said, making it almost indestructible.



Patent Automatic Double Headed Crimper.

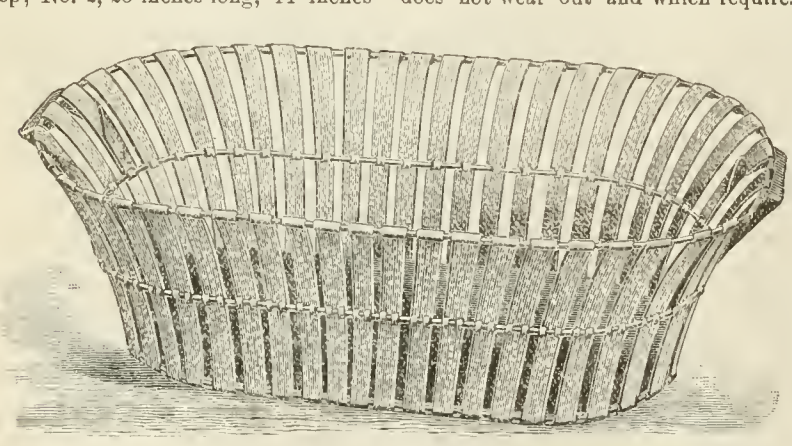
THE RETAIL STORE.

A Half Century in Business.

William P. Fuller, who keeps a stove and tinware store on St. Peter street, Salem, Mass., has completed 50 years in business, having commenced his career on February 1, 1844. Mr. Fuller was born in October, 1819, in Salem, and at 14 years of age went to work for his father, who was a tin worker and kept a shop on Neptune, now called Walnut street, in Salem. He served an apprenticeship of seven years, and some time after he attained his majority went to Boston and worked at his trade. Later he returned to Salem and began business for himself, taking for a partner Thomas Reed, the partnership, however, continuing for only a year. Mr. Fuller remained on Washington street for a period of 22 years, and then removed to the building on St. Peter street, three doors from his present quarters. He then took for a partner Charles W. Dodge, the relation continuing a year until Mr. Dodge went west. It is said that of all the firms on Essex street in 1844, not a single one is engaged in business to-day.

Century Steel Basket.

The accompanying cut represents a steel basket being introduced by the Buffalo Specialty Mfg. Company, Buffalo, N. Y. The basket is all steel, excepting the bottom, which is hard wood. The metal part is galvanized, making it attractive and rust proof. The manufacturers claim that the basket remains sweet and clean, as nothing can penetrate into it, that it cannot wear out and that it cannot break. It is designed as a handsome, strong, attractive and light display and delivery basket for grocers, butchers, bakers and merchants generally. The baskets are made in three sizes: No. 1, 21 inches long, 13 inches wide and 7¾ inches deep; No. 2, 23 inches long, 14 inches wide, 7¾ inches deep, and No. 3, 25 inches long, 15 inches wide, 7¾ inches deep. The dimensions given are top measurements.

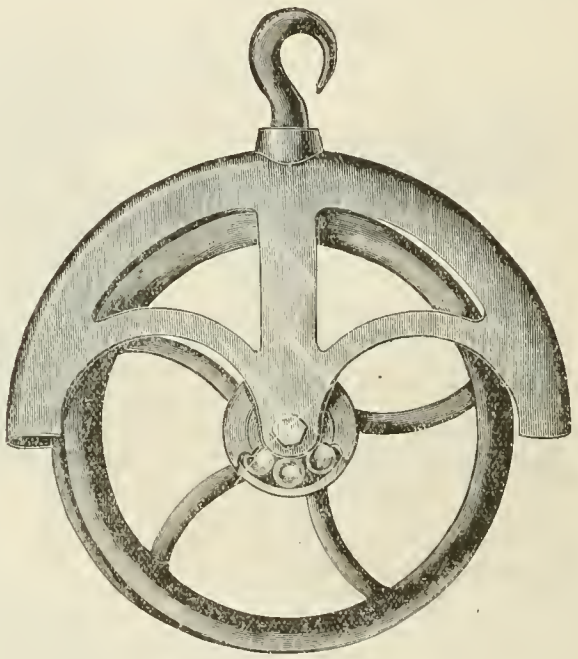


Century Steel Basket.

Geo. W. Rockwell, dealer in Hardware, Stoves, &c., Horseheads, N. Y., has admitted as partner in his business Chandler A. Hammond, a former clerk in his employ. The new firm will be known as Rockwell & Hammond.

Ball Bearing Well Wheel.

The cut shown herewith represents a ball bearing anti-friction hoisting or well wheel pulley, offered by T. F. Cheriton Hardware Company, 62 Reade street, New York. The manufacturers claim that the ball bearing principle thus applied to well wheels results in a perfect anti-friction pulley which runs easily, does not get out of order, does not wear out and which requires less labor in use. The wheels are made in 10 and 12 inch sizes, japanned.



Ball Bearing Well Wheel.

C. Pratt has taken a portion of F. J. Mattison's office, at 69 Beekman street, New York, and is offering, as agent for this territory, a line of fine Cooking Utensils at very low prices. These goods are manufactured by Hall & Carpenter, Philadelphia, Pa., and are known as Crown Scorch Proof Cooking Utensils. The manufacturers guarantee them made of XXXX best charcoal tin, with 20-ounce copper bottoms. They are double bottomed, the copper extending up the sides from 1 to 1½ inches. The space between the bottoms is filled, they state, with the finest quality of asbestos, making the vessels proof against scorching or burning. This line of goods, patented in the United States and in Canada, consists of Saucepans and Kettles, each four sizes, 2 to 6 quarts; Sauce Pots, 8, 10 and 12 quarts; shallow Stew Pans, four sizes, all with heavy retinned covers, and Chocolate Pots, 2, 3, 4, 5, 6 pints. The outer surface is buffed to improve its appearance. The Crown Asbestos Stove Mat, circular in form and 9 inches in diameter, is offered in connection with the other goods.

Lape's Scissors Sharpener.

In Fig. 1 is shown a full sized cut of a scissors sharpener introduced by W. E. Lape, Syracuse, N. Y. It is made of emery, and, it is remarked, will never wear out. The wire is designed as a

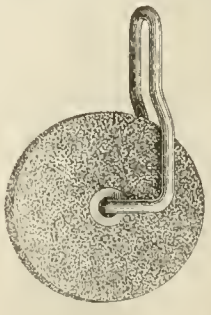


Fig. 1.—Lape's Scissors Sharpener.

gauge to retain the beveled edge on the scissors when in use, as in Fig. 2. The flat side of the blade is placed against

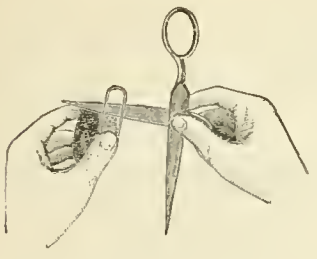

Fig. 2.—Scissors Sharpener in Use.

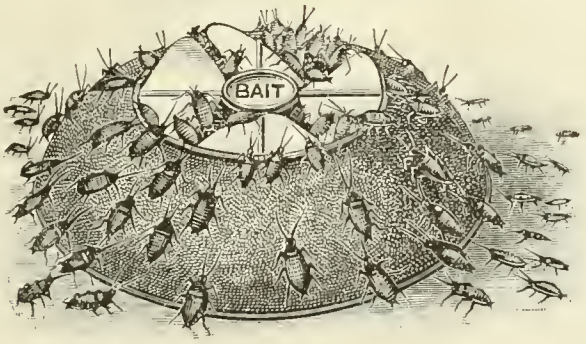
the wire and the blade moved back and forth under firm pressure, both on the wire and wheel.

Yankee Roach and Beetle Trap.

The accompanying cut represents a roach and beetle trap, offered by Silver & Co., 304-310 Hewes street, Brooklyn, and 20 Warren street, New York. The trap is made of tin, with a granulated surface, 8 inches in diameter and 3 inches high. At the top of the trap



Yankee Roach and Beetle Trap.

are sensitive revolving plates which turn with the weight of the bug when trying to reach the bait at the center. The trap is entirely of metal, and it is stated that it is always ready for use and easily emptied.

Improved Boxwood Folding Rule.

Keuffel & Esser Company, 127 Fulton street, New York, are manufacturing an improved boxwood folding pocket rule, so arranged at the joints that when opened the sections are aligned throughout instead of zig-zagging, as has been the difficulty heretofore. This, of course, shortened the measurement and impaired the correctness of it, unless extreme care was used to keep the line straight. This is effected by mounting the inner sides at the joints with strips of thin spring sheet steel, in which are punched straight ridges which articulate with corresponding indentations on the opposite piece when the rule is either open or closed. Especial attention is called by the makers to the fact that they are thinner and lighter than the ordinary joint rule and extremely accurate from the reason that the wood is peculiarly prepared to prevent shrinkage entirely. The rules are made in 16 sizes, from 2 two 8 feet long, having from 4 to 16 folds. Four of the sizes are made extra flexible for measuring curved or bent objects if desired.

MEMORANDA.

THE STOVE AND TINWARE STORE of Winston & Higgenson, Waco, Texas, was destroyed by fire on February 14.

IN *The Metal Worker* of February 17, in referring to the partnership of Samuel M. Wilkinson and Miles J. Watson, under the name of Wilkinson & Watson, we erroneously stated where they would open a new hardware store. The firm are in business in Oberlin, Ohio, not Mansfield.

IN A CIRCULAR to the trade Cordley & Hayes, 172 Duane street, New York, call attention to new lines of Indurated Fiber Ware, which are included in their catalogue under date of February 15, 1894. These goods include Ice Water Buckets, with faucets; Chambers, more especially adapted for use in public institutions, and Fire Pails with flat and round bottoms. Reference is made to the fact that goods will be shipped promptly upon receipt of orders, and that their trade-mark and label appear on each article.

A scheme for assisting the deserving poor and those out of employment has been started by a well-known clergyman in New York City. It is a pawn shop and loan office where they can obtain immediate financial help at the lowest possible cost. The enterprise has proved highly successful, and it is said to be backed by one of the wealthiest citizens of New York. Such has been the run on the pawnbrokers during the past six months that many are now discriminating closely in the loaning of money.

A movement is on foot toward the consolidation of the pipe line interests of the United States which are outside the Standard Oil Company.

Disagreement in regard to the wage scale caused the closing of all the coal mines in the Massillon district, Ohio, on Saturday. Three thousand miners were thrown out of work.

A pamphlet recently published by *Bradstreet's* gives an interesting analysis of the causes of the 15,508 failures in business which occurred during last year. They are given as follows: Incompetence, 2546; inexperience, 940; lack of capital, 5194; unwise credits, 726; failures of others, 446; extravagance, 198; neglect, 481; competition, 191; disaster, 3463; speculation, 181, and fraud, 1142.

Secretary Herbert has refused to entertain a petition forwarded by the Central Labor Union for the opening of the Boston Navy Yard, on account of the heavy expense that would be entailed on the Navy Department in putting the yard into a proper condition for work.

Methods of Advertising.

BY D. C. FOOTE.

After many years of experience in the Hardware business and its various branches, one may begin to realize some of the qualities and methods required to build up and extend a business that shall be both substantial and remunerative. To be thoroughly successful one must have a liking or adaptation to the business, for while to the uninitiated it may look easy, not every one can conduct a Hardware store and make it pay; at least not without some previous training for their chosen vocation.

While one must be governed in methods by his location and trade, yet there are a number of general principles that may influence the extension of one's business by increasing the demand for the merchandise which is offered for sale. Advertising in the local papers, if judiciously done, may be considered one of the most important means to this end. The writer believes that ordinarily a brief statement of the facts concerning the goods to which one wishes to call attention is better and has a more lasting effect than an elaborate or overdrawn statement or one of too many words.

CUT IN PRICES.

A cut of the article or articles advertised is a great factor, especially in this line of business. The advertisement should be changed as often as once each week each succeeding advertisement being more attractive and novel than the former, if possible, for when an advertisement becomes stale it is a waste of printers' ink. One of the best advertisements of Hardware that I have ever seen was used by an energetic firm who do an exteusive and growing business in Southern Michigan. This consisted of a cut of some leading event of the day, with a few words relative to it leading to some special article for sale. This was changed nearly every week with a new cut, and when displayed near the column of local news was always observed and while occupying a small space always hit the mark. The cuts were obtained of a firm who make this work a specialty—suiting the cut to the advertisement desired.

NEWSPAPER ADVERTISING

is an art which evidently had never been cultivated by the firm who had furniture to sell and also combined undertaking with their business, and who, wishing to call attention to their bargains in furniture, headed their advertisement in bold type: This will interest you; and following this announcement with the cut of a hearse. A student in Yale College is fitting himself especially for writing newspaper ads, finding in it a field both congenial and remunerative, and when cultivated talent is used for this purpose one may expect to reap results accordingly: Hood, Wanamaker, and a host of others attest by their success the power of the pen to extend business. One Hardware jobbing house is pinning its faith to this method by investing $50,000 in advertising a special make of Bicycle, which will doubtless make it one of the leading wheels. This enterprise in advertising may be used by retail dealers on a reduced scale to advantage.

Advertise, advertise.
Art in asking him who buys
There the merchant's secret lies.
Advertise.

Circulars, while often cast aside as of minor importance, yet serve in their humble capacity to arrest if not hold the attention of a customer, and often form the connecting link in the chain which binds a bargain. But how most

efficiently to use them is the question. To distribute them from door to door is antiquated and unsatisfactory, and in many of the larger cities is justly prohibited. The best way to dispose of circulars and other printed matter is to have a box of suitable size in which to arrange and classify them, placed conveniently near the wrapping counter, and when goods are done up, neatly insert in the package such circulars as would be of interest to the customer. This is the most delicate and effective way of using them and often proves a good investment for the trouble. There are other ways of using them, but the writer has found this the best solution of their disposal.

CUNNINGLY DEVISED.

One of the most unique and striking advertisements was recently used by an enterprising Hardware firm in one of our leading cities, as follows: There appeared in the daily paper an advertisement that this firm would give away 500 gas stoves, and those desiring to secure one should call and see a sample of the stove and leave their names and the stove would be delivered on a certain day. It was a one-burner stove which usually retails for $1.50 and was really a desirable article. No such generosity had ever been heard of before in a business way and, as may be imagined, the people came with a rush and kept the clerks busy taking their names till the desired number was reached. Of course, to give away 500 stoves without any benefit to the donor could hardly be expected. The rubber tubing used for connecting the stove, which was required to be purchased of the firm, partially paid the investment, while the demand created for the ovens, broilers and other furniture to complete the outfit reduced the loss to a minimum if it did not in the end leave a profit by creating a future demand.

A CHEAP CATALOGUE.

A photographic reprint of a large Hardware catalogue reduced in size to 5 x 6 inches and about 2 inches thick, containing over 1200 pages, bound in red cloth, was recently made by a large jobbing house, leaving out their name entire and inserting the name of the retail dealer, to whom it was sold at a cost of 30 cents per volume. This distribution to the customers of the retail dealer was highly appreciated and is one of the most permanent mediums of advertising that has ever been originated. Where one has seasonable novelties in the house furnishing line to sell, a large special postal card, containing cuts and descriptions of articles, mailed to prospective customers, often brings purchasers.

STOVES.

One of the the most important articles in a general retail Hardware store is stoves, an article in which there is usually severe competition, and their successful sale depends much upon the method used in showing them. The writer believes the model way to show them is to have a room separate if possible from the general store, and this attractively furnished, walls papered, floor carpeted, and supplied with chairs for the comfort of customers. The stoves exhibited, thoroughly blacked and polished, should be arranged on large caster trucks so as to easily handle them before a purchaser. When a cooking stove of unusual merit is being offered an exhibition of its baking qualities might be given, and an announcement of such an exhibition made in the local paper, stating the day and hour and inviting those especially interested to come and witness its merits as a baker. This same idea might be followed up with many other lines of goods, mantels and grates, Builders' Hardware and many things in the house furnishing line where the size of the town or city will permit of it, and even in small towns one would find this method profitable.

DISPLAYING GOODS.

There is nothing that will do more to keep pace with the times than the proper displaying of goods. The front windows are a most important part of this feature, and cannot be overestimated. A man may be clothed in the most fastidious manner and in the latest fashion, but if his face be grimy and unshaven it will mar the whole and no one will remember anything but the face. So it is with the store. The office and the goods on the shelves may be in good order, but if the show windows are dirty and used for storage rather than display the effect is depressing on the observer; while on the other hand, a window that has a clean front, with goods attractively displayed, will often cause a passer by to stop and look, with many chances of his becoming a purchaser. It is not in the province of this discussion to make suggestions as to how most attractively to dress a window with Hardware, but when dry goods and other stores find it profitable to pay good salaries for special work of this kind, it should not fail to interest those who are desirous of extending their trade.

CLERKS.

The arrangement of the store should be as automatic as possible. The wants of the customer should be responded to without any bungling by experienced clerks, who are thoroughly posted in the routine of the business of their special department. Too little attention is given to the old proverb, "Knowledge is power," for therein lies the sequel for a successful salesman, and as he is the motive power which propels the craft, it behooves the commander that his crew are well instructed and thoroughly drilled, for upon them depends his success or failure. Where more than four or five clerks are employed I believe it a most commendable plan that they be made thoroughly conversant with any new or special article purchased. This can be done by the buyer, who obtains his points from the traveler, or by the traveler himself. Suppose a new kind of lawn mower has been purchased. Call the salesmen together at a convenient hour, say immediately after closing, if no other convenient time can be found, and spend a half hour, or even less, in exhibiting the special points of the mower—dissecting its parts and comparing its points with those of other manufacturers. Encourage comments by those present as to their ideas regarding the superior or defective points. This could be made a social evening, if thought best, with light refreshments, with papers previously prepared upon any special article relative to the trade, or debates might be given on such questions as—Resolved: That cut nails are better for general use than the wire nail, or that hot water heat is superior to hot air for heating houses of moderate size, &c.

FAMILIARITY WITH GOODS.

The writer has often found points gained by overhearing a traveling man who was well posted dilate upon an article he was selling invaluable in selling the same thing to the retail customer, and if this be true in one case, why not in all? When we know a thing absolutely, with what confidence we proclaim, and hence impart our faith to the hearer! A response to the demands of one's trade as to the class and kind of merchandise required to meet its wants is necessary if one would do a healthy and growing business. To be continuously out of an article for which there is a frequent call, thus allowing custom to drift to one's competitor, is a poor way to extend business in the right direction. To study the style and class of goods best calculated to please is an opportunity not to be overlooked. It is said that John Jacob Astor once foreclosed a mortgage which he had on a stock of millinery in New York City because the interest was not paid; after matters were adjusted the business was continued with Astor as a partner. Passing through Central Park one might have noted the millionaire leisurely sitting on one of the Park seats carefully observing the bonnets of the most stylishly dressed ladies out for their promenade; any head gear of a peculiar or fascinating style was fully noted and reported to his head milliner. The consequence was that business grew, and two men have since retired from the business worth $10,000,000 apiece. I have said nothing about the power of personal solicitation, but will close by quoting from the rules of a well-known Hardware firm:

"Go for business in every direction, in the store and out of it: wherever you see a chance to make a sale work for it with all your might."

In the courts at Pittsburgh this week a bill in equity was filed by James Todd and Frank L. Slocum against C. Y. Wheeler and the Sterling Steel Company. The suit involves a considerable sum of money. The plaintiffs state that in 1889 they invented a new method of manufacturing the so called aluminum chromium steel. An agreement was made with the defendants whereby the latter were to have the right to manufacture this steel for tool steel upon paying a royalty of 1 cent per pound so long as the secret of manufacture should not be discovered and a similar steel made and sold on the market by others. The defendants paid the royalty up to April, 1893, but, it is charged, have paid none since, and a large amount is due. They have also been using the process in making projectiles for cannon for the United States Government, and from this alone there is due royalties between $20,000 and $30,000. In addition to this the defendants have organized themselves as the Wheeler-Sterling Armor Piercing Projectile Company, and are using the process in making projectiles, but have never accounted to the plaintiffs for the royalties. The court is asked to compel the defendants to give an accounting and pay the royalties due.

The Manhattan Elevated Railroad of New York City has just provided itself with an addition to its equipment of 20 new locomotives, which are the heaviest yet put on an elevated road system. They were built at the Pittsburgh Locomotive and Car Works and are designed to haul a load of five cars, weighing 29,000 pounds each, on a grade of 2.5 per cent. and at a maximum speed of 25 miles an hour. The new locomotives have driving wheels 3 feet 6 inches in diameter, cylinders 12x16 inches and a boiler carrying a working steam pressure of 140 pounds. The total weight of the engine is 47,000 pounds, of which 33,000 pounds are on the drivers. They are equipped with the Eames vacuum brakes.

Nearly 7000 potters are idle in Trenton, N. J., owing to wage disputes.

STOVE TRADE NOTES.

Cupola Management.*—V.

BY DR. EDWARD KIRK.

Lighting Up.

When the cupola is small the shavings are thrown in from the charging door and evenly distributed over the bottom. The wood is cut short and split fine and dropped down, a few pieces at a time, and so placed that the fire will burn up evenly and quickly. When the cupola is large the melter goes down into it and his helper passes him down the shavings and wood from the charging door. The shavings are evenly spread over the bottom, care being taken to get plenty around the outside to insure a good light. A layer of fine, light dry wood is then laid over the shavings, and on this a layer of heavier wood, and so on until the required quantity of wood for lighting the bed is placed in the cupola. Care is taken to arrange the wood so it will burn up evenly and quickly. A light dry wood should be used, and the pieces must not be very large or too much time will be consumed in burning them, and the bed will settle unevenly.

When the wood has been arranged the melter gets out and a thin layer of small coal or coke is placed over the wood. The bed fuel is then thrown in evenly over the wood. All the bed is put in but a few shovelfuls, which are kept to fill up any holes that may be formed by uneven settling. The charging door is then closed and the shavings lighted at the front opening. The tuyere doors are opened to give draft and the fire left to burn up. When the wood is nearly burned out and there is a good fire of hot coals at the front and tuyeres, the melter generally puts in the front and builds a wood fire on the spout to dry it. He then looks in at the charging door, and if the smoke is burned off and the fire beginning to show through the top of the bed, he puts in the remaining few shovels of fuel and makes the top of the bed as level as possible. He then closes all the tuyere doors but one and begins charging the iron into the cupola.

Straw may be used in place of shavings for lighting up when shavings cannot be procured. The wood should be dry pine or other light wood, and it must not be used in too large sticks or the bed will be burned too much before the wood is burned out; and if the iron is charged before the wood is burned out it smokes and the melter cannot see how to place the iron or fuel. For the same reason, hard or green wood should not be used in lighting up.

When the bed burns up on one side and not on the other in a small cupola, the bed may be burned upon the other side after the blast is put on and the heat run off successfully. But when the bed burns up on one side and not on the other in a large cupola the bottom had better be dropped at once. I once had to drop the bottom of a 60-inch cupola before the heat was half off, for the reason that the melter was careless in arranging the wood and lighting up, and charged the iron with the bed only burned upon one side. He thought the blast would make it burn up on the other side, but it did not, and the heat was a failure. Never burn the bed up to warm or heat up the cupola, for a cupola does not require to be heated before it is charged, and the lining burns out fast enough without wasting fuel to burn it out.

The Bed.

Iron is melted in a cupola within a limited space, known as the melting point or melting zone. The melting point is the highest point in a cupola at which iron is melted properly, and the melting zone is the space between the highest and lowest point at which iron melts properly. Iron may be melted to a limited extent above or below these two points, but it is burned, hardened and generally dull. The melting zone exteuds across the cupola above the tuyeres, and is from 6 to 8 inches in depth. Its exact location is determined by the volume of blast and the nature of the fuel employed in melting. A large volume of blast gives a high melting point, and a small volume a low melting point. A soft, combustible fuel gives a high melting point, and a hard fuel a low melting point, the blast being equal in volume with both fuels.

To do good melting the melting point must be discovered and only a sufficient quantity of fuel placed in the bed to bring the top of the bed up to the melting point. When the fuel is hard anthracite coal the rule is to use a sufficient quantity of coal in the bed to bring the top of the bed 14 inches above the top of the tuyeres when the wood is burned out, with hard Connellsville coke 18 inches, and with soft coke 20 to 25 inches. But the melting point is varied by the volume of blast and these rules do not always hold good. So the melting point in each cupola must be learned to get the best results from the cupola.

To find the melting point a bed is put in according to the rule and iron charged upon it. If the iron is a long time in coming down after the blast is put on, or the iron melts very slowly during the melting of the first charge, but melts faster at the latter end of the charge and is hot, the bed is too high and the iron is being melted upon the upper edge of the melting zone. Fuel and time are then being wasted and the fuel should be reduced so as to place the iron at the melting point when melting begins. If the iron comes down quick but is dull, or if it comes slow and dull and does not grow hotter at the latter end of the charge, the melting is being done on the lower edge of the melting zone and the quantity of fuel should be increased to bring the top of the bed up to the melting point. When the top of the bed is placed only half way up the melting zone the iron comes down hot and fast, but the bed does not melt the quantity of iron it should and the latter part of the charge on the bed is dull. The latter part of the charge on the bed when the bed is the proper hight is also dull if the charge is too heavy for the bed and care must be taken in noting this point.

If by comparison with the charges of iron in various size cupolas the charge on the bed is found to be light, the bed should be raised until the melting indicates that it is at a proper hight; then the weight of iron on the bed may be increased, if the charge is too light When raising or lowering a bed, it should be done gradually by increasing or decreasing the fuel from 50 to 100 pounds each heat until the exact amount of fuel required in the bed is found. If the changes in the bed are made gradually in this way, the effect of the changes upon the melting may be observed more accurately and better results obtained than when a radical change is made by increasing or decreasing the fuel in large amounts at one heat. When the amount of fuel is found that brings the top of the bed to a hight that gives the best results in melting, the top of the bed is maintained at that point each heat.

When a cupola is newly lined the diameter is decreased from what it was with the old lining, and the weight of fuel in the bed must be decreased to bring the top of the bed down to the melting point, and as the lining burns out and the cupola gets larger the fuel must be increased to keep the bed up to the melting point. Trouble is often experienced in melting after a cupola has been newly lined. This is because the diameter of the cupola is reduced from 6 to 10 inches, and the bed and charges are not changed to correspond with the reduced size of the cupola. There is never any trouble of this kind in foundries where a cupola book is provided and a record kept of the melting from one year's end to another, for the melter or foreman can look back and see the weight of the bed and charges when the cupola was newly lined and the increase made in the weight as the lining burned out and the diameter increased.

No definite or even approximate weight can be given of the amount of fuel required for a bed in cupolas of different diameters, for the tuyeres are placed at such a variety of hights above the sand bottom that for two cupolas of exactly the same diameter twice the quantity of fuel may be required for a bed in one as is required for a bed in the other. Cupolas with two or three rows of tuyeres require a larger amount of fuel for a bed than cupolas with but one row, but the same general directions for burning and managing the bed apply to all cupolas.

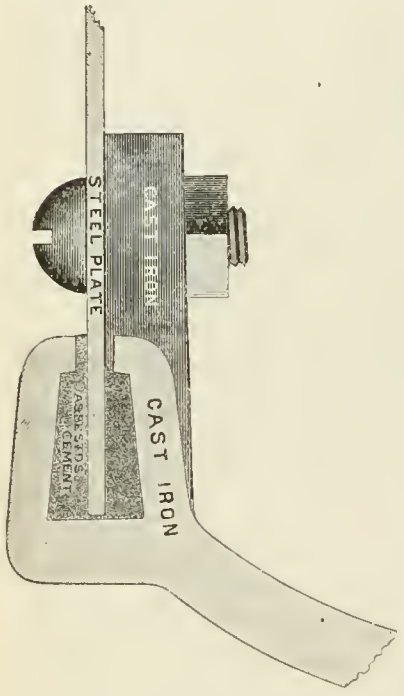
*Copyrighted, 1894, by Dr. Edward Kirk.

AT LANSING, MICH., on the 10th inst., E. Bement & Sons' extensive manufacturing establishment was damaged by fire to the extent of about $10,000. The blaze orignated from an oil furnace in the blacksmith shop, and completely gutted that building. Excellent service was rendered by the fire department and the adjoining buildings were saved. About 50 persons were employed in the blacksmith shop

who will be temporarily out of work. The building was a brick structure, 82 x 250 feet in size, and was insured for $4500. The walls are left standing and the loss is more than covered by the insurance. There is, however, quite a heavy loss upon the machinery and tools, some of which were quite valuable. The shop will be rebuilt at once.

A Gas Tight Joint.

The accompanying cut is reproduced to illustrate the care taken in the details of furnace construction by Schwab & Sercomb of Milwaukee, Wis., manufacturers of Gilt Edge furnaces. It shows an absolutely gas tight joint connection of the steel plate with the cast iron parts of the furnace. This is an improvement introduced by the firm this season. The connections of the steel



A Gas Tight Joint.

plate of both the dome and the radiator with the cast iron dome top and cast iron spider, also of the cast iron drum rings of the radiator, are constructed with a double flange and a lip on the inside of either flange, thus forming a perfect groove, which is filled with fibrous asbestos cement, and on account of the inside lips is unable to become loosened. Between the two flanges is inserted the steel plate, against which the lips of the groove are tightly pressed and held, thus forming a gas tight joint and always holding the steel plate in position. This method of construction, we understand, is exclusively used in the Gilt Edge furnace.

The Excelsior Furnace Warehouse.

The Excelsior Steel Furnace Company are now removing to their new building, at 38 West Monroe street, Chicago. The offices are already located in the new quarters and good progress has been made in the removal of machinery and stock. The new building consists of five stories and a basement and occupies a lot 200 x 50 feet, thus affording about 60,000 feet of floor space. The company at present have possession of but half the building, a portion being occupied by other tenants whose leases expire shortly, when all will be occupied by the Excelsior. The space then under their control is expected to be sufficient to permit of considerable growth in their business. The building is of mill construction, is comparatively new and well adapted to the company's purposes. Although in the middle of a block it has a large central light shaft, which enables every part of it to be used by workmen. The floors are 5 inches thick. Three floors will be used for manufacturing and the other three for storage. A 2-ton elevator is located in the front of the building and a 5-ton elevator in the rear, enabling goods and raw materials to be handled in and out easily. A 24-foot alley extends along the rear.

The offices are located in the front of the second floor. The remainder of this floor is used for the storage of furnace fittings and supplies. The stock of fittings carried is so immense and so many racks are needed to keep each kind separate that this part of the floor has been made into two stories, which is permitted by the hight of the ceiling. Galleries are built to give easy access to the upper tiers of racks. Furnace repairs are carried in racks built near windows so as to give them good light. In the rear are stored parts of furnaces, so arranged that on a call for a furnace of a certain size all the parts can be assembled with few steps and conveniently to the elevator. Steam and hot water radiators are also stored in the same vicinity. The list of articles kept by the company will be continually extended, with the fixed intention to carry such a stock that there will not be a single thing needed by a furnaceman that cannot be obtained from this house. This description of the second floor shows what will be done on the other floors used for storage purposes when the company's plans are fully worked out.

History of a Stove.

The following account of an old stove is taken from a recent issue of the *Troy Daily Press*:

Marcus L. Filley, president of the Green Island Foundry Company, received a letter to-day from Von R. Van Raub of Van Raub, Bexan County, Texas, which contains an interesting tale about a stove. The letter is addressed to Newbury, Filley & Co., the original stove firm on Green Island, and the writer expresses his doubts as to whether it will ever reach its destination, the address being taken from the stove, which is an antique. The story is best related in the words of the writer. He says: "I am a traveling man and noticed the other day in the wilderness of this State an old stove made by Newbury, Filley & Co. The stove has been in one family 40 years, and was purchased from a gang of outlaws who had used it ten years. It has been in constant use more than 50 years and is in good shape yet. My object in writing you is to settle a dispute, as some say the stove is only 60 years old, while others have its history for 88 years. The stove has no date of manufacture, or patent date, and I suppose it was made before the United States Patent Office was instituted. The only inscription it bears is 'Newbury, Filley & Co., Troy, New York,' and over the oven doors 'Diamond Rock.' The stove has seen much blood spilled around its hearth, according to the stories, having been owned by a tough band. Until recently it has been 580 miles from a railroad, and when delivered originally it had to be conveyed 2000 miles by wagon." The writer states that if Mr. Filley desires to purchase the stove for a relic he can procure it for him. He gives as reference any business man in San Antonio, Texas. Mr. Filley says the letter reminds him of an incident connected with his first sale of a stove in Texas. It was disposed of to a family residing several miles from town, and a few days after the sale the head of the family drove to Mr. Filley's hotel and informed him that he wanted his money back, as the "blamed thing wouldn't work." Mr. Filley went with the man to his house and found that he had been building a fire in the oven and attempting to cook his victuals on top.

ODD PLATES.

Some of the local papers have been making mention of the name of Lazard Kahn of F. & L. Kahn & Bros., Hamilton, Ohio, as a candidate for Congressional honors. If we are correctly informed, this is not the first time that such use has been made of his name, as for the past three years leading politicians of that section have recognized him as a man of brilliant accomplishments, a man well versed in all phases of life, and one eminently fitted to serve in Congress with honor to himself, party and country. In reply, however, to the direct question by the representative of a local paper if he would be a candidate for Congress, Mr. Kahn said he would not, neither could he allow his name to be used in such connection.

F. M. Borden & Bro., 118–122 North Second street, Philadelphia, Pa., are sending to the trade their New Process catalogue for 1894, showing the various gasoline stoves they handle under that name. It is accompanied by folders showing the Splendid Novelty vapor stoves, both the high generating and the low or junior styles, with ovens, broilers, cookers and other kitchen furniture.

In a recent issue of the *Progressive Age* is an article showing the profits derived from the rental of gas stoves by a gas company operating in a far Western town of about 50,000 people. The stove business of the company dates from October 1, 1892, the statement covering the operations of one year. During that period 265 stoves, heaters and appliances were sold and 147 rented, making a total of 412. Of these 206 were on separate fuel meters, and the statement therefore covers only the business done in connection with 206 stoves. The revenue derived from the gas consumed at $1.50 a thousand cubic feet, and from the rental of 147 stoves at 49 cents per month, is given as $10,653.36. The cost of the gas, interest on the investment in rented stoves, depreciation on the latter at an average life of five years, cost of setting 59 stoves which were sold outright and interest on the investment in fuel meters was $6141.54 leaving a net revenue of $4511.82.

The Ringen Stove Company of St. Louis, Mo., have issued a notice to the trade to the effect that arrangements have been made with Ralph S. Buck of San Francisco, Cal., to represent the company in Central and Northern California, in the interest of the Quick Meal gasoline and gas stoves. Mr. Buck will carry a full assorted stock in San Fran-

cisco so that customers may be assured of immediate shipment upon receipt of orders addressed to the company's representative at that point. With the announcement to the trade is inclosed a copy of a small pamphlet such as the company are furnishing in liberal quantities for distribution. It shows the general appearance of the Quick Meal gasoline stove for 1894, as well as tells the story of the "Quick Meal pie" The company state that as the season is well advanced and the business has not heretofore been handled by them direct they are not thoroughly posted as to who have been Quick Meal agents throughout Central and Northern California. To ascertain this the manufacturers inclose a postal card addressed to Mr. Buck with the request that it be filled out and mailed to him, stating what gasoline stoves were handled in 1893.

E. L. Black of Mount Vernon, Ohio, favors us with a copy of a little catalogue relating to the Comfort warm air furnaces, which he manufactures, adapted for soft coal, coke or hard coal. The heater is described at some length, and illustrations are presented showing the appearance of the furnace with the brick work removed, and also the construction of the grate. The latter is an important feature, as it is so arranged that one half the grate surface may be dumped, while the other half remains undisturbed. As the manufacturer puts it, "the grates are shaking and at the same time dumping endways." The catalogue contains, in addition to an illustrated description of the furnace, numerous testimonial letters from some of those who have used the goods, together with tables of prices and of dimensions and capacity of the Comfort hot air heaters. Mr. Black states that he has had a very good trade in these goods during the past year, and that every 12 months the volume of business has shown a gratifying increase.

The Joliet Stove Works, Joliet, Ill., have issued a very neat folder illustrating and describing Moore's ranges, for which strong claims are made. The stoves, embodying the modern improvements, are decorated in a tasteful and effective manner and are claimed to be standard in all that the name implies. The makers state that in every respect Moore's ranges are first class, being made in a "first-class shop by first-class workmen from best grades of pig iron and molded in Albany sand." The fourth page of the folder calls attention to Moore's Fidelity range, which is a six-hole construction especially designed for soft coal. It has large flues, heavy linings and improved shaking and dumping grate, large ash pan, gray enameled reservoir, high square oven, giving full measure on the bottom. Moore's Matchless is a four-hole range, also designed for burning soft coal. It is the same as the Fidelity with the exception of the top.

The Lebanon Stove Works, Lebanon, Pa., recently suspended operations for the purpose of making repairs. According to a local paper the engine, which is planted on marshy ground, has been found to be out of plumb, and in consequence will have to be raised a trifle. The foundry is being repaired under the management of Superintendent Reilley, work having been commenced the early portion of the week.

We are indebted to J. Van Wormer & Co., Albany, N. Y., for circulars relating to the new lines of Astral ranges which they are offering the trade. Under the name Ideal Astral, they have brought out a new four-hole range constructed from the latest style of patterns and embodying the modern improvements. The decorative features are neat and attractive and the stove is offered in four sizes square and four sizes with reservoir. The Astral B is a medium priced range made in four sizes square and three sizes with reservoir. The Prize Astral is a new six-hole range having sectional top, cut long centers, duplex grate for coal and basket grate for wood, large oven, double cemented bottom, extra large fire box and ash pan and flush reservoir top. It is made in four sizes and the usual varieties.

The Richmond Stove Company of Norwich, Conn., resumed work on Monday, February 19, after a shut down of three weeks.

About two months ago some of the molders of the Smith & Anthony Company, whose foundry is located at Wakefield, Mass., refused to work under a reduction of wages. They recently decided, however, to recede from their position, and on Tuesday of last week accepted a reduction of about 8 per cent.

The W. J. Loth Stove Company, successors to the Waynesboro Stove Company of Waynesboro, Va., send us a copy of a supplementary catalogue which they have issued relating to the Blue Ridge cook stoves, ranges and heaters. The pamphlet is of 24 pages bound in colored paper covers, and contains, in addition to illustrations of the various lines mentioned, ample descriptive letterpress, together with prices of the various sizes in which the stoves are made. The opening pages are devoted to the Blue Ridge Fannie, a new and cheap five-hole range for coal or wood; the F. F. V., a four-hole cook stove made in six sizes; the New South, another member of this class; the Blue Ridge Franklin, a new open stove with nickel trimmings and embodying the modern features of construction; the Templeton, an attractive cottage parlor stove made in three sizes; the Valley, a new dwarf or monkey stove, also made in three sizes; the Mascot and Antrim cannon stoves, and the Carey, a new style box stove in four sizes. Several pages are devoted to price-lists of hollow ware, &c.

Harry King has just returned from a trip through the West for the Kernan Furnace Company, Utica, N. Y., and is about to make a similar trip through New England.

Schill Bros., Crestline, Ohio, have completed arrangements with Davis, Johnson & Co., 45 Jackson street, Chicago, Ill., for the exclusive sale of their New Idea furnaces in the States of Illinois, Iowa, Wisconsin and Missouri, in each of which they have a representative who thoroughly covers the ground. Schill Bros. have received for their first spring allotment an order for 200 furnaces, which includes a full line of the New Ideas to be kept in stock. All orders for the States referred to are filled from the Chicago establishment. The reports from headquarters received through their agencies in other sections are of the most flattering character.

At a recent meeting of the Art Stove Company, Detroit, Mich., Theodore Miller was elected president, Neil McMillan treasurer and H. Leonard Wilton secretary. The traveling salesmen of the company are on the road at the present time, and the manufacturers state that their new lines of stoves and ranges are about ready to be placed on the market. The company have increased their capital stock to $200,000.

The Quick Meal Stove Company of St. Louis, Mo., have issued a little catalogue relating to Quick Meal gas stoves and ranges, as well as ovens, sad iron heaters, broilers and saucepans. The pamphlet is of a size convenient to carry in the pocket and is bound in colored paper covers, a space being left at the bottom of the front page for the business card of the dealer handling the company's goods. The latter are illustrated and described at some length, and the general make up of the pamphlet is such as to interest the reader.

"The Stove Repair Order and Record Book" is the title of a volume which reaches us from Daniel P. Holmes of Norwich, Conn. As its name indicates, it is intended for the use of dealers in ordering stove repairs. The printing is upon one side of the page only, each leaf being divided into two parts by a dotted line running from top to bottom, the idea being to tear out the part carrying the order and mail it to the repair dealer, while the other portion remains as a stub in the book. Each order is also given a number, which the repair man is requested to mark upon each casting, while if the order cannot be filled the slip is to be returned. The book is copyrighted by Mr. Holmes and copies are sold at 50 cents each.

The Cleveland Co-operative Stove Company of Cleveland, Ohio, have brought out a new heater for the season of 1894, known as the Cleveland Oak. This is regarded by the manufacturers as one of the most complete stoves of its class ever constructed and they expect it will meet with extended favor at the hands of the trade.

The Fuller & Warren Company, Troy, N. Y., send us a special illustrated catalogue of warm air furnaces and combination warm air and hot water heaters. Within its covers a telegraphic code is given, together with illustrations and descriptive particulars of the goods named. There are also tables of prices, diagrams showing how furnaces should be set, together with directions of interest in this connection. The catalogue is arranged with a view to meeting the requirements of the trade and is bound in colored paper covers. The company furnish at the back of the volume a blank form which can be filled out by any one desiring an estimate upon one of the maker's furnaces.

A colored circular with letters in white has been issued by the Peninsular Stove Company of Detroit, Chicago and Buffalo, referring to their French drop oven door. The door is in two parts, the upper half a swing door and the lower half a drop door with patented spring steel hinge. When the drop door is open it forms a strong flush oven shelf, while the swing door remains closed and retains the greater part of the heat otherwise lost. This makes it economical, and, it is pointed out, the oven does not cool off and interfere with the baking every time the door is opened. The circular is ornamented with representations of the company's trade-mark. We have been shown a remarkably strong testimonial of the Novel Peninsular cook stove, written by one of the company's customers. In

it he not only alludes to the admirable operating qualities of this stove, but also dwells with special weight on the drop oven door, which is alluded to as a very strong feature in assisting in its sale.

R. Robinson & Sons, 105 Lake street, Chicago, have issued a four-page leaflet descriptive of their line of Superior vapor stoves. These stoves have been greatly improved for 1894. The process stoves are made with brass burner drums highly nickeled, and with cast tops and bottoms. The sub-flame now used is a great improvement, making the stoves work perfectly. All their stoves have plated needle points, glass drip tubes to show the flow of gasoline, nickel tank rests, &c. They are well designed and handsomely ornamented. The line comprises a cabinet process range, with or without a shelf; an open frame process stove with two or three burners, a single generator stove with two or three burners, and high and low juniors in the usual sizes.

The Michigan Stove Company make telling use of the slang expression "a corker" in some advertising matter they are now distributing. A flat piece of cork, cut in the shape of a champagne cork and bearing on it the inscription above quoted, is glued to the top of a very handsomely printed card which calls attention to the merits of Garland stoves and ranges. The card is tinted pink on one side and yellow on the other, and is sent though the mails as an enlarged postal card. The design is quaint and impressive, the use of the slang term being very ingeniously worked up.

A press dispatch from Massillon, Ohio, announces that a fire destroyed, on February 19, the pattern storehouse of Hess, Snyder & Co., makers of stoves, windmills, &c., in that place. The loss is estimated at $5000, partially covered by insurance.

The Gobeille Pattern Company, Cleveland, Ohio, send out a postal card telling the trade that nothing is so costly as a small pattern shop without a lot of work ahead. Those who have shut down their pattern shops are invited to send to the Gobeille Pattern Company before starting them up again. In a little circular they say: "It is just as foreign to a foundry or machine shop to make its own wooden patterns as it would be to make its own emery wheels or to print its own stationery."

The Utica Stove Repair Company have sold out their entire business to Goodenow & Morehouse, Utica, N. Y., who will continue it in connection with their stove and tin trade.

The big tower at Wembly Park, near London, England, designed to rival the Eiffel Tower, is completed to the first platform, which forms the base of the actual shaft, and the work is being pushed with energy. England, it is announced, is also to have a gigantic wheel after the model of the Ferris Wheel. It is to be set up, says the report, near London, and will be 300 feet high, have 40 passenger cars attached to its circumference, and the tower supporting it will have eight platforms, fitted with restaurants and dancing floors.

In spite of the hard times more anthracite coal was mined and sold in 1893 than in any other year, while the average price obtained was higher than that of several years previous.

Trade Notes.

The page announcement this week of Sam S. Utter, 113 Beekman street, New York, tells the trade about his Game gas stoves, also Game oil stoves and Summer Girl lamp stoves.

The large Tin Can and Japanned Ware factory of Norton Brothers, occupying half of the triangular block facing on Dock and Water streets, Chicago, was destroyed by fire February 19. The direct monetary damage is estimated at $200,000. The firm have another large establishment at Maywood, from which they will be able to supply most of their specialties.

Fred J. Meyers Mfg. Company, recently of Covington, Ky., have, since February 1, been installed in their new factory, built during the past year at Hamilton, Ohio. These buildings cover, it is said, 4½ acres of ground, and the company allude to the plant as the largest in the country for the manufacture of their line of goods. There are two lines of railroads running directly into the works. The company have about finished, we are told, a large storeroom in which to accommodate finished stock. It will be remembered that this concern were burned out March 4, 1893, and since that time have been building the plant just occupied. As an inducement to come there the town, we are advised, donated the ground on which to erect the buildings. They are now in a position to execute any orders in their line. Their Eastern headquarters are at 69 Beekman street, New York, F. J. Mattison, agent.

In their advertisement elsewhere in this issue the Bailey-Farrell Mfg. Company, Pittsburgh, Pa., direct attention of the trade to the Eureka Smoke Test Machine, an illustration of which appeared in *The Metal Worker* of February 17. The price of this machine is given as $15, and the trade are requested to send for descriptive circulars.

A destructive fire, which broke out in a large business block in St. Louis, Mo., on Thursday last, claimed among its victims the Udell Woodenware Company of that city. Their warehouse and store, holding a large stock of goods, valued at $100,000, were, with their contents, demolished by the fire. The loss, which was complete, is stated to be fully covered by insurance. The Udell Woodenware Company were burned out a year ago, and recently began business anew in the building just destroyed.

A steel ship of great cargo carrying capacity, to be named the "Dirigo," is about to be launched at Bath, Maine, and as soon as the ways are clear another is to be laid down. The future of these Maine built steel vessels will be watched with interest, observes the Boston *Transcript*, for if they return a handsome profit to their owners, the fact will demonstrate that a great New England industry need not leave New England in order to enable it to procure raw material at prices consistent with a good return on labor and capital.

A new lodge of the Amalgamated Association has just been organized at Gas City, Ind. It is claimed to contain 75 members.

Trade of Principal Ports.

The Bureau of Statistics, at Washington, has just issued a comparative statement of the values of merchandise imports and exports, by customs districts, for the years 1893 and 1892, which shows that little change took place in the relative position of the principal commercial ports of the United States during the past year. The figures for all ports the imports and exports of which exceeded $10,000,000 in value are given as follows:

Imports.

	1893.	1892.
New York	$492,100,000	$539,800,000
Boston	69,100,000	75,500,000
Philadelphia	58,800,000	63,200,000
San Francisco	39,400,000	45,600,000
New Orleans	21,100,000	18,800,000
Chicago	17,700,000	17,000,000
Baltimore	15,000,000	14,100,000

Exports.

	1893.	1892.
New York	$357,900,000	$377,700,000
New Orleans	85,200,000	107,600,000
Boston	83,500,000	88,800,000
Baltimore	74,800,000	91,900,000
Philadelphia	43,500,000	60,300,000
Galveston	35,900,000	35,600,000
San Francisco	28,800,000	31,700,000
Savannah	23,500,000	20,300,000
Charleston	11,000,000	11,300,000
Norfolk	10,600,000	8,300,000
Newport News	10,500,000	11,600,000

The total of merchandise imports for the whole country for 1893 shows a shrinkage of about $64,000,000 and the exports a decrease of $62,000,000 as compared with 1892. In imports there is no change in the order of the seven ports named, but New Orleans, Chicago and Baltimore alone show any increase, while the four most important receiving ports—New York, Boston, Philadelphia and San Francisco—all exhibit a material falling off. In the case of exports, the only changes in the relative rank of the principal shipping ports during 1893 are that Boston, by virtue of a lesser shrinkage in her exports than is shown by Baltimore, goes ahead of that city, taking the third place after New York and New Orleans, while Norfolk, which did not appear on the list last year, takes precedence of Newport News. All the Southern ports except New Orleans make a fair showing, while the Northern ports uniformly reflect the business depression of the year by a shrinkage of more or less magnitude in their shipments.

Taken as a whole, remarks the New York *Journal of Commerce*, the year's record is notable rather as an evidence of the extent to which even the most distant ports and the commerce of the whole country reflect the same influences, than as an indication of any remarkable development of new branches or routes of trade, or changes in the relative commercial importance of different cities or sections.

In the course of a paper on the magnetic concentration of iron ore, before the Engineers' Club of Philadelphia, Edward K. Landis reported that in 1882 he had occasion to make some very interesting experiments with a small model of the Anvil Furnace of the Pottstown Iron Company. Among other curious facts it was clearly demonstrated that the distribution of fine ore in a furnace was governed principally by the size of the bell, but was also influenced by the fluctuation of the stock line, showing that with a correctly proportioned bell and the maintenance of the stock at the proper line any modern furnace should handle the ordinary concentrated ores crushed to ¾ or ½ inch mesh without the least difficulty.

TRADE REPORT.

The Iron Market.

The situation is somewhat monotonous, although it is encouraging to find that the volume of business is gradually increasing. In saying this it is not to be supposed that there is any great activity, or that the mills are running full time, which would be far from the truth. Some mills are doing an average business, some are doing half to two-thirds, some are doing absolutely nothing, so that, taking it all around, there is not more than 50 % to 60 % of the normal output. Considering that this is 15 % to 20 % better than during the latter portion of 1893, it is clear that the tendency is toward improvement.

The same estimate would probably apply to the foundry trade, as well as to other branches, so that while there is improvement, and the current is in the right direction, the situation is still very far from being what it would be in ordinary times.

Pig Iron.—Some additional lots of cheap Southern Iron have been sold in the New York market at prices in keeping with the low figures referred to last week. Otherwise none but routine business has passed, and the demand, as generally reported, continues tame. Prices have undergone no decided change, but the leaning is, if anything, still in buyers' favor, since livelier interest is shown by sellers than by buyers. Particularly is this the case with low Foundry and Mill grades. We quote standard brands $13 @ $13.50 for No. 1; $12.50 @ $13 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $13.50 for No. 1; $11.75 @ $12.50 for No. 2; $11.50 @ $12 for No. 3; $11.50 @ $11.75 for No. 2 Soft, and $12 @ $12.50 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $10 75 @ $11.25.

The Philadelphia Pig Iron market is somewhat unsettled by reports that contracts for Ore have been made at unprecedentedly low prices. The present outlook is very discouraging to the owners of furnaces in Eastern Pennsylvania. The foundry trade is about all they have to depend upon, and as that is to some extent supplied by Southern and Central Pennsylvania furnaces, the pickings look very small compared with what they were a few years ago. As regards the immediate condition of the market, there is little to be said except that it is dull and prices barely steady. Stocks are not unduly large, but sellers seem to be willing to meet all demands at current quotations, which for Philadelphia and equivalent points are about as follows:

No. 1 Foundry	$13.00 @ $13.50
No. 2 Foundry	12.50 @ 13.00

Chicago advices intimate that more than an average week's business has occurred in local Coke Iron and sellers talk very hopefully of prospects for more trade. The bulk of transactions, however, continues to be in small lots, as the disposition to contract ahead is not general. Among the sales made the past few days were some which have cut still further into the Southern Iron trade. Foundrymen are changing their proportions of local and Southern Iron and now making the bulk of their mixture of the former. The aggregate of small sales of Southern Iron was fair during the week, but, so far as reported, no large contracts have been made. Quotations are given as follows, for cash:

Lake Superior Charcoal	$15.30 @ $15.50
Local Coke Foundry, No. 1	12.00 @ 12.50
Local Coke Foundry, No. 2	11.50 @ 12.00
Local Coke Foundry, No. 3	11.00 @ 11.50
Local Scotch	13.00 @ 13.50
Ohio Strong Softeners No. 1	15.00 @ 15.50
Southern Silvery, No. 1	@ 13.75
Southern Silvery, No. 2	@ 13.25
Southern Coke, No. 2	11.50 @ 11.65
Southern Coke, No. 3	11.00 @ 11.50
Southern, No. 1, Soft	11.50 @ 11.65
Southern, No. 2, Soft	11.00 @ 11.50
Tennessee Charcoal, No. 1	16.00 @ 16.50
Tennessee Charcoal, No. 2	@ 15.00
Alabama Car Wheel	18.00 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

The Pittsburgh Pig Iron market was extremely quiet during the week, no transactions of importance coming to the surface. Allegheny County is now making more Iron than at any time since last summer. We quote as follows:

No. 1 Foundry	$11.50 @ $11.75, cash
No. 2 Foundry	10.75 @ 11.00 "

There has been a light volume of trade in Southern Pig Iron markets during the week, not because of any scarcity of stock, but because there were no buyers of large lots, either for spot or forward delivery. There was small increase in the demand from the smaller foundries for current consumption, which was freely supplied at previous quotations and at the close there are more free sellers of all kinds of Southern Iron and it is believed that buyers could obtain concession of 25¢ ℔ ton, although there have been no transactions on which to base such a quotation. A large rolling mill has been started up in Birmingham, Ala., and it is pretty certain that low prices were made for the new material to be used, a part of which is Steel Billets from Pittsburgh. The primary object was to get the mill into operation, and if low rates were made on Pig Iron it was only to a moderate extent and seems not to have affected prices in the district at large. There is no increase in the demand for Charcoal Iron, but the whole tone of the market is easy, especially for the lower grades. Quotations are merely nominal, as follows:

Southern Coke, No. 1	$11.25 @ $11.50
Southern Coke, No. 2	10.25 @ 10.50
Southern Coke, No. 3	9.75 @ 10.00
Ohio Soft Stone Coal, No. 1	14.50 @ 15.50
Ohio Soft Stone Coal, No. 2	14.25 @ 14.50
Lake Superior Coke, No. 1	13.00 @ 13.50
Lake Superior Coke, No. 2	12.00 @ 12.25
Hanging Rock Charcoal, No. 1	17.00 @ 17.50
Hanging Rock Charcoal, No. 2	16.50 @ 17.00
Tennessee Charcoal, No. 1	13.50 @ 14.00
Tennessee Charcoal, No. 2	12.50 @ 13.00
Standard Southern Car Wheel	16.75 @ 17.75
Lake Superior Car Wheel and Malleable	16.50 @ 17.00

Metal Market.

Pig Tin.—Prices have ruled a fraction lower on Straits Tin for prompt and near future delivery, or, say, on the basis of 19.40¢ @ 19.45¢, net cash, for 5 ton lots. The concession has failed to excite livelier buying on the part of dealers or consumers and proved quite as ineffective as an inducement to speculative operations. Some exceedingly low selling prices on distant future deliveries have been reported with like result. The popular explanation of the unusual inactivity is the effect of the uncertainties of tariff legislation, particularly in view of the large holdings in European markets, the considerable amount of stock in bonded warehouses here and late heavy shipments from the primary sources of supply. During the first half of February no less than 1875 tons were sent out from the Straits as against 1125 during the corresponding period last year. In connection with heavy January shipments from the Straits and the fact that the shipments thence last year were nearly 10,000 tons in excess of the movement during the year 1891, this would seem to be a reasonable explanation of the dull condition of the market and general hesitancy and indecision prevalent at the present time. Jobbing business is extremely quiet, consumers restricting their orders to the narrowest possible limits.

Copper.—There have been some signs of more active business in this line. Few facts come to the surface, since the leading operators cling to the idea that the "mysterious" is the best policy, but rumor has it that not only the leading Lake Superior companies but some producers of the lower grade metal have taken quite liberal orders and that the prices were lower than any that operators on 'change have ventured to offer at. The facts in this connection

however, remain hidden. Hence all that can be said is that the rumor has to go for what it is worth. Pending developments, the popular quotations are 9⅝¢ @ 9¾¢ for Lake Superior Ingot, 9½¢ for Electrolytic and 9⅛¢ @ 9⅜¢ for ordinary casting brands. There is little indication of any expansion in the demand from smaller consumers for either Ingot or Manufactured Copper, purchases of all kinds continuing on strictly conservative lines. Jobbers' prices are, nevertheless, fairly steady at the low level now ruling. Cornice makers have an unusually light amount of work on hand at present, but a considerable number of substantial orders are said to be pending which should materialize before many weeks, provided confidence, in the building trade, is sufficiently restored to admit of certain suspended and deferred operations being carried out.

Pig Lead.—The softness that came prominently to the front last week has become more pronounced since and the market at this writing is, to the best of it, looking rather depressed. There are sellers at 3.25¢, and few, if any, buyers. There are requests for bids of 3.20¢ and the response is almost inaudible. There were a few offers of 3.15¢ for single carload lots, prompt or near future delivery. A very light consumptive demand for Pig is reported by dealers and jobbers. Lead Pipe and Sheet Lead are equally quiet, and prices for small lots incline to weakness.

Spelter.—Irregularity has been the prominent feature. Western advices go to show that the effect of late speculative deals there has worn off; that the proposed reduction in output has been well discounted and that there are yet a few more tons unsold. In the face of extremely high prices quoted from St. Louis it has been no difficult matter to purchase good Western brands at 3.90¢ @ 3.95¢, delivered here. In speculative quarters there were offers of carload lots at a shade less for delivery this month and next.

Sheet Zinc.—Business has been entirely commonplace. As noted in another column, manufacturers' quotations on Sheet Zinc have been advanced slightly. Jobbers' prices for small quantities remain, however, unchanged for the present.

Antimony.—There is about the usual movement. Prices remain steady. For small lots Hallett's is quoted at 10¼¢ and Cookson's at 10¾¢.

Tin Plates.—Business in all classes of Plates has been irregular, but without improvement in any direction. Spot goods are being taken in a very moderate way only, despite the fact that holders are in many cases offering them at a reduction of 5¢ @ 10¢ a box below the lowest quoted rates. Little or nothing of any moment has been done in regard to future deliveries, even though every inducement is offered in the way of price. Practically buyers rule the market, which can only be described as weak and low, with trading far below the average for this season of the year. "Free" stocks in the hands of importers and jobbers are remaining generally low; but considerable quantities of Plates are held in hand and only drawn out as required, pending the expected readjustment of the tariff.

A London cable dispatch to *The Iron Age* of February 21 describes the British Tin Plate market as quiet. Some speculative inquiry prevailed for far forward deliveries, but buyers' ideas were much below ruling prices, and little business was effected. More mills are being closed down owing to lowness of prices. Sales have been made of ordinary Bessemer Cokes, 14 x 20, at as low as 9/9, f.o.b. Wales, and on other sorts prices average 1½ pence lower than they have been recently, on moderate sales. For Ternes and Black Plates the market is very dull. Stocks of Plates at Swansea are now about 229,000 boxes. Liverpool prices are quoted as follows:

IC Charcoal, Alloway grade	12/3 @ 12/9
IC Bessemer Steel, Coke finish	10/6 @ 11/
IC Siemens " " "	11/ @ 11/3
IC Coke, B. V. grade, 14 x 20	Nominal.
Charcoal Terne, Dean grade	10/3 @ 10/9

Sheet Iron.—Sheet Iron manufacturers generally appear to be busy and several mills have been put into operation quite recently to meet orders. In some quarters it is claimed that enough orders have been booked to keep the mills busy until summer on both Black and Galvanized Iron. However this may be, it is certain that some large consumers have awakened to the desirability of anticipating their wants at the low prices now ruling, as some considerable orders have been placed with the mills during the past week or ten days. Meanwhile jobbers state that the demand for Sheet Iron from small consumers continues very languid and prices largely in buyers' favor. Black Sheets are particularly weak in this latter respect, but Galvanized Iron is inclined to stiffen. There is not much demand from cornice makers for the latter material, building operations being generally in abeyance. Black Sheets of light gauge for tinning purposes are very active, most manufacturers of this product being behind their orders and the demand increasing

---

THE SHEET AND GALVANIZING DEPARTMENTS of the Soho Iron & Steel Works of the Moorhead-McCleane Company, at Pittsburgh, Pa., continue in full operation, giving employment to about 400 men. The other departments of this plant remain idle, with no prospects of immediate resumption.

THE BOORE MFG. COMPANY of Buffalo, N. Y., were recently incorporated, with a capital of $30,000, for the manufacture of patented gas regulators. The directors are: Lewis Boore, John E. Haas, John F. Diehl and others of Buffalo.

Chicago Report.

Scrap.—Iron and Steel are dull and neglected. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb.
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	6.00	....
Malleable Cast	5.00	....
Stove Plate (free of burnt)	4.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	4.00	....
No. 2, such as Shovels, Hoes, &c	3.00	....
Old Boilers—whole (Iron)	3.00	....
" (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3 ¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	3½¢

Anthracite.—Very little movement is reported by dealers. Prices are somewhat firmer by action of the mining companies, but the schedule for this market is still being shaded. Carload lots of 12 net tons or over are nominally quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.	
Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

THE ATTENTION of our readers is directed to the eight-page advertisement of the St. Louis Stamping Company, St. Louis, Mo., which appears in this issue. These pages contain the reduced price-list of their well known Granite Ironware and also the standard list of their Imperial Enameled Steel Ware. These lists include every article they manufacture, both in Granite and Imperial Ware, and are arranged in a systematic manner, which will be appreciated by the trade. Many of our readers will doubtless preserve these lists, as they will be found extremely useful in ordering these well known goods. This company have recently issued a new catalogue of both Granite Ironware and Imperial Enameled Steel Ware, which will be sent to the trade on application.

DANIEL G. FRENCH & CO. of Chicago, manufacturers of and dealers in canners' machinery and supplies, contemplate the erection of a factory at Hoopeston, Ill., an important canning center, and the consolidation of their various manufacturing interests at that point. The Union Can Company have already located there as a convenient point for the manufacture of tin cans.

CONDITION OF THE

Hardware Trade.

BUSINESS CONTINUES to be characterized by the same general features as for the past week or two, with perhaps a slight falling off in the demand. This is regarded as owing to the fact that with the opening of the year a good many houses placed orders for the replenishing of their stocks, and this having been done there is a disposition to await the active opening of trade before purchasing further. The fact that the end of the month is approaching has also some influence on buyers. The general demand, however, continues fair and many of our advices indicate a continuance of the improved feeling which has been apparent since the opening of the year. With the large force of travelers on the road and the efforts which are being made by manufacturers and their representatives to secure orders, the aggregate volume of business is unquestionably fair, though not yet as large as under usual conditions is expected at this time. Prices are without important change, but the tone of the market is not strong; and notwithstanding the improved condition in Barb Wire and Wire Nails the tendency is toward lower quotations on some lines of goods, especially those that lie near the raw material. The desire of manufacturers to keep their works in as full operation as possible also has the effect of making them willing to shade prices in some cases. Under these conditions there is a marked absence of speculative buying and the trade are wisely pursuing the conservative policy which has characterized their operations for some time. Collections on the whole are probably in excellent condition, but some complaint is made of sluggishness in remittances.

Advices from Chicago.—Shelf Hardware jobbers in some cases report the best trade of the year now coming in, but others are not so well favored, finding their orders falling somewhat below those of last week. Jobbers of Tinware and related goods report the first three days of last week as showing a decided improvement in Tinware and tinners' stock, but later in the week trade fell off to some extent. The well-known establishment of Norton Brothers in this city was completely destroyed by fire on Monday evening, and it will be some time before the gap in the local trade thus created will be filled. The firm have another large establishment, however, at Maywood, from which they will be able to supply most of their specialties. The Heavy Hardware trade is spasmodic, days of fair business being followed by periods of dullness.

Notes on Prices.

Wire Nails.—The Wire Nail market is represented by the quotation of $1.10, for carload lots at factory, a price which is adhered to except in the case of unusually large and attractive orders. The market is characterized by an excellent tone, the mills being well supplied with orders, and some buyers being still in the market. There is also a good inquiry from other houses whose purchases are not so large, and the outlook for a continued demand is regarded as excellent.

Advices from Chicago.—Inquiries for Wire Nails are good and orders are being placed by buyers who had already contracted for what they supposed would cover their wants for the spring trade. The price on factory lots is now practically $1.20, Chicago, with some manufacturers asking up to $1.25. Quotations are being made for immediate acceptance, owing to the continued pressure for rapid shipments on contracts and the steady receipt of inquiries and orders. Jobbers report a good demand from their trade and quote mixed carloads at $1.20, while small lots from stock are selling at $1.25.

Cut Nails.—The Cut Nail market is in substantially the same condition as last week. The market in the East is represented by the manufacturers' quotation of $1.05, for carload lots on dock, New York, and the Western market by the quotation of $1.00 to $1.05, at mill. The price from store in New York is firm at $1.15.

Advices from Chicago.—The inquiry for Cut Steel Nails has improved considerably. Orders were quite freely placed during the past week from various parts of the territory tributary to this market. The Lakeside Mill started up on Monday with an accumulation of orders which will insure a steady run. Factory lots are quoted at $1.05, Chicago, on a 60 cent average, while small lots from stock are unchanged at $1.15 to $1.20.

Barb Wire.—There have been no important developments in the Barb Wire market since our last review, and the manufacturers are apparently adhering to the new and advanced prices. The market is thus represented by the quotation of $2.15, for carload lots of Galvanized Four Point, at Pittsburgh, $2.20 at Cleveland, $2.25 at Cincinnati or Allentown, and $2.35 at New York. There is a good deal of inquiry for Barb Wire and it is understood that some orders have been placed at the advanced prices.

Advices from Chicago.—The heavy storm last week, which was general throughout the Northwest, is credited with checking the demand for mill shipments of Barb Wire, so that the week compares unfavorably with the record of its immediate predecessors. This is expected to be made up shortly, however, as it is too late in the season for snow storms to influence trade unfavorably in a good portion of the West. Prices are now $2.30, Chicago, for carload lots of Galvanized, while small lots are selling from stock at $2.35 to $2.40. Jobbers report a continued excellent demand from the country merchants.

Wrought Iron Pipe.—The market for Wrought Iron Pipe is lower and somewhat irregular. This is owing to the light demand and the active competition for business.

Traps.—We are advised by the Oneida Community, Kenwood, N. Y., that they have withdrawn the discounts on their Traps, which were named in our issue of February 10, and instead of them announce the following:

	Per cent.
Newhouse	40 and 10
Hawley & Norton	70 and 5
Victor	70, 10 and 5
All Steel	75
Star	50 and 10

Rope.—With the moderate demand which has prevailed for some time the Cordage market has developed weakness and Manila can be purchased in large lots, f.o.b. factory or New York, at 6¾ to 6⅞ cents per pound basis, a price which is subject only to the cash discount of 1½ per cent. Sisal is also obtainable in similar lots at 4¾ cents, and Jute at 5 cents, in the present condition of the market Sisal Hemp being lower than Jute Hemp.

National Coffee, Drug and Spice Mill.—This article was described in our last issue as put on the market by the National Specialty Mfg. Company of Philadelphia. The mill is sold to the trade at $21 per dozen, subject to a discount of 30 per cent.

National Measuring Faucet.—National Specialty Mfg. Company, Philadelphia, are putting this article on the market, a description of which was given in a recent issue. The Measuring Faucet is sold to the trade at $36 per dozen, subject to a discount of 25 and 10 per cent.

Handy Holder.—The Handy Holders manufactured by H. C. Weidenmann, 3517 Wallace street, Philadelphia, Pa., are sold at $15 per 100, subject to a discount of 40 per cent. 30 days, with an additional discount of 5 per cent. for spot cash.

Glass.—There has been little change in the glass market during the past week, with no indications of any increase in prices. Demand has not been at all active, while the unfavorable weather during the past week has had a tendency to curtail orders. Factories have kept their production close to the demand, and there is but a slight increase in the number of factories in operation. There are indications of improved demand in Plate Glass, but prices, it is understood, are very low; in fact, it is difficult to obtain quotations except on specifications. It is reported that the low prices are attributable to a war now being carried on by the large companies engaged in the business. The New York Window Glass market is

represented by the quotation of 85 @ 85 and 5 per cent. discount for single strength Glass in small quantities, and 85 and 10 per cent. discount in car lota. Pittsburgh quotations are reported as being 85 and 10 and 5 per cent. discount for single and 85 and 20 per cent. discount for double strength Glass. It is understood that factories outside of Pittsburgh are making lower prices. A Muncie, Ind., concern quoted Window Glass under date of February 9 as follows: Single strength, 85 and 10 and 5 per cent. discount; double strength, 85 and 10 and 10 per cent. discount, freight allowed in carload lots.

Sheet Zinc.—Under date February 15, Matthiessen & Hegeler Zinc Company, La Salle, Ill., issue revised quotations on Sheet Zinc. The price remains $4.50 per 100 pounds for Sheet Zinc in 600-pound casks, of the thicknesses between Nos. 9 to 15, inclusive, and of the widths between 32 to 46 inches, and of the lengths between 84 to 90 inches, and the extras also are unchanged. The following revised discounts are, however, announced:

Discounts.	First class. 15 600 pound casks, and upward.	Second class. 10 to 14 600 pound casks.	Third class. 5 to 9 600 pound casks.	Fourth class. Under 5 600 pound cakes.
	Per cent.	Per cent.	Per cent.	Per cent.
Special	4	4	4	4
Cash with order	3	3	3	3
Quantity	3	2	1	0
Total	10	9	8	7

All discounts are computed straight when money accompanies order, quantity discount being added to special discount in all cases. If remittance is received within 10 days of date of invoice the cash discount will be only 2 per cent. instead of 3 per cent., and not computed straight. Each order is strictly subject to the quotations of the class to which it belongs.

Old Metals.—Some more interest has been exhibited in some kinds of Scrap Iron during the week, but the movement has not been sufficiently extended to affect prices, which remain at their former low level. There is little doing in other kinds of Old Metals. The following quotations represent approximately the present prices paid by New York dealers:

Heavy Copper	℔ lb	7¢
Light and Tinned Copper	℔ lb	6¢
Heavy Brass	℔ lb	5¢
Light Brass	℔ lb	4¢
Lead	℔ lb	3¢
Tea Lead	℔ lb	2½¢
Zinc	℔ lb	2¼¢
No. 1 Pewter	℔ lb	13¢
No. 2 Pewter	℔ lb	6¢
Wrought Scrap Iron, ℔ gross ton	$7.00 @	$8.00
Heavy Cast Scrap, ℔ gross ton	7.00 @	8.00
Stove Plate Scrap, ℔ gross ton	4.00 @	5.00
Burnt Iron, ℔ gross ton	2.50 @	3.00

Old Rubber.—The market for this material remains very quiet. New York dealers' prices are nominally as follows:

Car Springs, ton lots, ℔ lb.	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@	.03
Rubber shoes, less than carloads, ℔ lb.	0.02¼ @	.03⅛
Large Hose, ℔ ton	@	9.00
White Wringer Rolls, ℔ lb.	@	.04¼
White Syringes, ℔ lb.	@	.05

Old Rags, Paper, &c.—While paper mills are fairly busy, the demand for paper materials does not increase to any appreciable extent, the mills being as a rule pretty well stocked. Business in Old Raga, Paper, &c., continues consequently dull and prices remain narrow. Quotations for New York delivery are nominally as follows:

No. 1 White Rags	℔ lb	3¼ @ 3½¢
No. 2 White Rags	℔ lb	2¼ @ 2½¢
Mixed Rags	℔ lb	⅝¢
Blues and 3ds	℔ lb	1 @ 1¼¢
Hard Sized White Shavings	℔ lb	2¼ @ 2½¢
No. 1 White Book Shavings	℔ lb	2 @ 2⅛¢
No. 2 White Book Shavings	℔ lb	1 @ 1⅛¢
Light Book Shavings	℔ lb	¾¢
No. 1 Mixed Shavings	℔ lb	¾ @ 1 ¢
No. 2 Mixed Shavings	℔ lb	½ @ ⅝¢
No. 1 Printed Books	℔ lb	1 @ 1¼¢
Ordinary Mixed Books	℔ lb	½ @ ⅝¢
Newspapers	℔ lb	2-5 @ ½¢
No. 1 Manila Paper	℔ lb	1 @ 1⅛¢
No. 2 Manila Paper	℔ lb	⅝ @ ⅝¢
Bogus Paper	℔ lb	⅜¢
Common Paper	℔ lb	⅜¢
Straw Chips	℔ lb	½¢
Binders' Clippings	℔ lb	½ @ ⅝¢
Jute Butts	℔ lb	1⅞ @ 2 ¢
No. 1 Jute Bagging	℔ lb	1 @ 1¼¢
Mixed Bagging	℔ lb	¾ @ 1 ¢
No. 2 Bagging	℔ lb	½ @ ⅝¢
Hemp Twine	℔ lb	2 @ 2¼¢
Manila Rope	℔ lb	2¼ @ 2⅝¢
Jute Rope	℔ lb	1½ @ 1¾¢
Mixed Rope	℔ lb	¾ @ ⅞¢

There is said to be a growing disposition among Northern cotton manufacturers toward removing to the South, so as to place themselves in closer proximity to the source of supply of raw material. It is calculated that an economy of nearly 16 per cent. would thus be secured. A number of Southern cotton mills are preparing to weave and finish goods in order to get them directly to the merchant who distributes them, thus saving the unnecessary expense incurred in handling the goods between the Southern spinners, the Northern weaver, the jobber, and the distributer.

The special police census of the unemployed in New York City shows the number of males out of employment to be 52,592 and of females, 14,688, making a total of 67,280. These persons belong to 41,981 families, comprising 206,701 persons in all.

United States Consul F. C. Penfield, at Cairo, Egypt, has notified the State Department that the Egyptian Government has announced an extension of six months for receiving bids for the proposed construction and operation of a system of street railroads in Cairo and its environs

It Is Reported—

That C. C. Schultz & Co. have succeeded the Hardware firm of Schultz, Gerber & Co., Bartlett, Ill.

That a certificate of incorporation has been issued to the Niswander Hardware Company, Parkersburg, W. Va. The authorized capital of the company is $100,000.

That Gilbert & Son, Hardware merchants, of Indianola, Iowa, have sold out their stock to a new firm, the style of which will be H. F. Schrader & Co.

That E. A. Rea has sold his Hardware stock at Leroy, Iowa, to Samuel Easton.

That William Eidam has purchased C. W. Marquardt's Hardware store, at Scribner, Neb.

That Charles Woods has bought the Hardware stock of W. Kerns, Ney, Ohio.

That Schaub & Swarm's Hardware store, at St. Elmo, Ill., was recently robbed of $250 worth of Cutlery.

That the Hardware establishment of Ketcham & Wilson, Plymouth, Ind., was destroyed by fire on the 4th inst. The building was a four story brick structure. The loss is $15,000, partially insured.

That L. H. Bissell has purchased the interest of Geo. E. Deming in the Hardware business of Hollinger & Deming, Chariton, Iowa.

That Newman & Kennedy's Hardware store, at Portland, Mich., was burglarized on the 31st ult.

That about $100 worth of goods were secured by burglars from the store of Charles E. Wolf Hardware Company, Altoona, Pa., on the 2d inst.

That Carter & Graves' Hardware store, at Puncell, I. T., was damaged by fire on the 4th inst. to the extent of $4000. The stock was partially insured.

That N. D. Johnson, dealer in Hardware, Lynn, Mass., has removed his stock to larger quarters, a change necessitated by his increasing business.

That Durkee & Son's Hardware store, at Grafton, Ohio, was entered by burglars on the 31st ult., who carried off a considerable quantity of the Cutlery stock.

That in a large fire at Montgomery, Mo., on the 6th inst., the Hardware store of Frank Sabourin was destroyed. Loss, $8000; insurance $6000.

That L. A. LeMieux has sold his interest in the Hardware business at Oconto, Wis., to his brother, E. A. LeMieux, who was his former partner. The transfer took place on February 1.

That the following officers were elected at the recent annual meeting of the stockholders of the Paddock-Hawley Iron Company, St. Louis, Mo.: Gaius Paddock, president; George E. Hawley, vice-president; Orville Paddock, superintendent; William M. Miller, treasurer, and C. T. Brace, secretary.

That L. B. Sullivan & Co. have succeeded Sullivan & Key in the Hardware business at Nevada, Mo.

That Peter Dethleffs has purchased the large Hardware and Implement store of Arney Bros. & Crawford, Manning, Iowa.

That the Hardware store of M. Knecht, Omaha, Neb., was entered by burglars on the 31st ult. The safe was opened and $125 in cash abstracted. About $10 worth of Pocket Knives were also taken.

That J. K. Mawhorter's Hardware store, Ligonier, Ind., was destroyed by fire on the 4th inst.

That the Hardware store of W. H. Smith, Richland, Iowa, was burglarized recently.

That William Huxford will engage in the Hardware business at Madison, S. D.

That Jonas Miller of Alliance, Ohio, has purchased an interest in the Hardware business of F. V. B. Minnich, Goshen, Ind.

That S. C. Welch, Hardware dealer, at Millville, Minn., has sold out.

That H. O. Monson & Co. have gone out of the Hardware business at Wheaton, Minn.

That Frank I. Williams, dealer in implements, Bedford, Iowa, has sold out.

That Sharpnack, Ferguson & Co., dealers in Hardware, &c., Modale, Iowa, have disposed of their business.

That Moore & Pugh, Hardware merchants, Redwood Falls, Minn., have dissolved partnership.

That A. R. Silverdale & Co. have succeeded A. N. Bates in the implement business at Marietta, Minn.

That I. M. Lyman, Hardware dealer, Concord, Neb., has sold out.

That F. H. Hudson and W. H. Carr have entered the Hardware business at Florence, N. C. The firm style will be Hudson & Carr. They will carry on a wholesale and retail business.

The House Organ.

The publication of house organs appears to be on the increase. Manufacturers, and numerous merchants as well, are of the opinion that a fallow field lies invitingly in this direction, ready to yield rich returns if properly cultivated. A member of the firm or an employee with literary aspirations undertakes the preparation of a periodical, or mayhap an occasional publication, which furnishes information of more or less interest and value to those specially connected with their line of trade, and incidentally advertising the goods which they manufacture or handle. The publication is then mailed gratuitously to as complete a list as can be worked up of those whose trade it is desirable to secure. The plan is not new, as some long established concerns have from time immemorial published "circulars," "bulletins" or "journals" at stated intervals and distributed them to possible patrons. But while the idea is old, its greatest development has been quite recently, so that it almost appears to be new.

Worthy and Worthless Papers.

Matters are fast getting into such shape now that a manufacturing or mercantile establishment will not be considered completely equipped for business unless it can boast of its own organ with its well organized publication department and very complete editorial corps. Some of these periodicals are of a really high order. They are beautifully printed, magnificently illustrated, and contain very instructive articles in their special line. They would be exceedingly creditable as independent publications, and are worthy of an existence. In fact, publications of this class are so well appreciated that their circulation lists are in danger of becoming unwieldy, and in some instances a subscription fee is exacted, which will, of course, only be paid by those to whom the publication is of genuine value. There are others, however, which have no special merit. They are mere advertising circulars, giving no interesting news, no original information, no results of tests or investigations, but are only devoted to puffing the house which stands sponsor for the publication. Yet money is thrown away in bringing them out regularly, in the hope that some trade may be influenced. This is, perhaps, the case, for printers' ink must be credited with a great deal of power. Even circulars are glanced at before they are thrown into waste baskets, and some of them have been known to lead to rather important results.

The Value of Trade Papers.

We do not share in the apprehension felt in some quarters that these house organs are destined eventually to supersede trade papers. The trade press has its legitimate function, which such private publications can by no means fill. In nearly every case the latter only cover a narrow field and rarely attain special distinction. The crop of fresh ideas is apt to run out, and the ambitious journalistic amateur who starts out to make an indelible impression on his customers finds that fresh talent must be won to his assistance if he would keep his venture from traveling in a rut. The house organ will have its day, like other experiments, and while the fever runs will be beneficial to printers and paper manufacturers. If the number of such publications could be limited to, say, one or two concerns in each particular line, the enterprising publishers would very probably reap advantages. But when this method of advertising becomes common there is nothing in it for any one in particular, and the practice of issuing such publications merely becomes a heavy tax. It appears to us most unwise to depend exclusively on such a scheme of advertising and to abandon, even temporarily, the trade journals which are recognized leaders in their lines.

Trouble in the Building Trade.

The carpenters of the country have not abandoned the effort to establish a general eight-hour day. District conventions were held throughout the country on the 22d ult., to continue the agitation of this question. One of the most important of these meetings was held in Chicago, delegates being present from a number of large cities in Illinois, Indiana, Iowa, Wisconsin and Michigan. A series of resolutions was adopted to the effect that it was the sense of the convention that the time had arrived when an eight-hour day was necessary to furnish employment for the greatly increased number of men seeking work, and also to furnish more time to workingmen for recreation and self improvement. April 1 was the date set to make a universal move to secure such a result. The hours of work were established from 8 till 5 o'clock, with an hour intermission in the middle of the day. All overtime, including Sundays and holidays, is to be counted as time and a half, and only allowable when the work is in immediate danger. As it is the evident intention of the leaders in this movement to force the payment of ten-hour wages for an eight-hour day, the prospect favors a bitter struggle between employers and workmen in the spring. This is unfortunate, because building projects had latterly become encouragingly numerous, and business in related lines promised to be greatly benefited. Instead of employment being secured for more men in the building trades, as set forth in the resolutions, this action may lead to the employment of but few. This would be most deplorable.

Steam Vessels on the Lakes.

Eight of the 20 customs districts in the United States in which the ownership of vessel tonnage on June 30, 1893, exceeded 50,000 tons were on the Great Lakes. New York is the only district in the country that exceeds Cleveland in steam tonnage, while the amount of steam tonnage owned in Buffalo is greater than in any district excepting those named and San Francisco. The NewYork district owns 1134 steam vessels, having a total tonnage of 441,265, while the Cleveland district owns 177 steam vessels having an aggregate tonnage of 183,346. Cleveland, with less than one-sixth the number of steam vessels, has more than one third the tonnage of New York. The total tonnage of sail, steam and canal boats of the principal districts of the Lakes is as follows: Cleveland, 241,093; Buffalo, 172,316; Port Huron, 169,137; Detroit, 160,165; Milwaukee, 95,743; Chicago, 90,530. The annual reports from the office of the Commissioner of Navigation prove that the Lakes are steadily gaining on other sections of the country in ownership of steam vessels. As specimens of marine architecture, the boats built on the Lakes are only exceeded by the Atlantic liners in the matter of size; in regard to design, equipment and workmanship there is but little choice between the two classes.

THE LETTER BOX.

The Sum of Small Savings.

From OBERLIN SMITH, *Bridgeton, N. J.*—Referring to your editorial "A Remarkable Economy," in *The Metal Worker* of January 27, I will say that I have for years past been familiar with many of the manufacturing methods of the company referred to, having made double shearing machines for trimming off the edges of the tin plate sheets in question, and having, later on, found certain schemes for utilizing the strips of surplus metal trimmed off, in reducing the sheets to size, entirely frustrated by the very sensible economy you speak of, where the plates were ordered at the factories abroad with but a very narrow margin for trimming. It may be of interest to your readers to make mention of a still more remarkable economy which is practiced in the making of these same cans, which, by the way, are of 5 gallons capacity and measure about 9½ inches square by 13¾ inches high. This saving was made in the amount of solder used for fastening the heads to the bodies and amounted to over 66 per cent., although the form of the seam and the strength of the joint were not at all changed. The seam in question is made by inserting the body in a groove formed around the edge of the head, the flange of the head outside of the groove standing up but little over ⅛ inch. The joint is then squeezed so as to throw this flange inward somewhat and the end of the body outward, thus making a dovetail fit, so to speak. This joint is somewhat strengthened by the friction of the parts, as the groove formed in the head is tightly squeezed upon the body; but in the nature of the case it cannot be very strong until after soldering, not being at all of the type known as a "double seam." The soldering was formerly done by holding the can at an angle of about 45° with the vertical, and dipping each of the eight edges forming the peripheries of the two heads in a shallow bath of melted solder, the flux having been previously applied to the metal before squeezing it together. Certain experiments showed that if the end of the body could be squeezed tighter in the groove of the head, so as to leave less room for solder between the four surfaces involved, considerably less solder would be used, and a machine was, therefore, developed for pressing the three thicknesses of metal closer together by a process known as roller squeezing, both ends of the can being done at once and the whole operation taking but a very few seconds. This, as was afterwards proved, saved about one-third of the solder, while making an equally good joint. Later experiments showed that if the can was lowered quickly into the solder and then lifted slowly out, with the seam somewhat inclined to the horizontal as it left the surface of the bath, so that the solder would drain toward the corner leaving the bath last, considerably less solder would adhere uselessly to the outside of the can. By carrying this principle out upon the four lower edges of the can in succession, inclining the seam the first three times in the same direction, so that the solder would flow from previous seams toward the one last dipped, and then inclining the fourth in the opposite direction, so that its drainage would be toward the same corner at which all the surplus solder had so far accumulated, and then by giving a fifth dip with the can in a diagonal direction, so that the corner in question struck the bath as an inverted pyramid, a drop of surplus solder was picked off, so to speak—by its being somewhat remelted and by its adhesion to the solder in the bath.

At a later period the five somewhat peculiar motions above mentioned were incorporated in an automatic machine, invented jointly by Mr. G. H. Perkins and myself. This machine carried two cans at a time, which could be placed in position by the right and left hands respectively of the attendant, who, while the dipping was being performed, could attend other machines alternately. This machine, of course, revolved the cans to exactly the proper angles, gave them proper speeds of entrance and exit, and finally knocked them out upon a table placed in front. The attendant replaced them the other end down, and the second time removed them out of the way. This process, as it proved, saved another third of the original amount of solder consumed, although apparently imitating the operation of hand dipping formerly practiced. Its success was, of course, due to its ability to give exactly the right motions and to its maintaining absolute uniformity in its action, as well as to its picking off the superfluous drop. Furthermore, a cheaper class of labor could be used and a larger production per operator be attained. I do not know exactly the amount of money that is being saved by the use of these machines, nearly 100 of which are running in various parts of the country, and such information as I have I do not, of course, feel at liberty to make public. The general mention of the system used is obviously perfectly legitimate, as full details of the squeezing and dipping machines in question have already been made public through the Patent Office. The moral of my tale is, of course, the pointing out of the enormous aggregate economy sometimes attained by careful attention to very small details, in cases where it happens that such details may be multiplied by a quantity consisting of indefinite millions. In other words, a multiplicand may be a very incousequent affair if the multiplier is only big enough. In this case the resulting product, made up from "little drops of solder, little dimes of pay" (to paraphraze the Sunday school song), is something which would, in the form of an income, make either the editor or me feel exceedingly happy.

Cold Water from Boiler.

From D. H. S., *Watkins N. Y.*—Noticing the reply to "H. & J.," of Pennsylvania, in *The Metal Worker*, February 24, allow me to say that running the hot water pipe down from the boiler will not interfere with the flow, if there is no connection between the flow pipe and the circulating pipe. The connection shown in the diagram is the primary cause of the trouble and the water flows as explained. The circulating pipe must be kept separate from all other pipes. There are four openings in every boiler, and the hot water pipe must always start from the top to get the hottest water.

Expansion of Metals.

From T. H. L., *Syracuse, N. Y.*—Please inform me through the columns of *The Metal Worker* what known metal, or combination of metals, will expand to the greatest extent when in contact with hot air or steam, and what would be the length of a heated rod of the same that was 12 inches long and ¼ inch in diameter when cold?

Answer.—Our correspondent has used the words hot and cold rather indefinitely, and we must assume certain definite temperatures from his steam and hot air if we are going to tell what the expansion of metals will be between the minimum and maximum. Metals expand regularly for each degree of heat, and we will, therefore, assume that the metal expands from freezing to boiling—that is, from 32° to 212° F. We have not at hand an exhaustive table of metals and alloys with regard to their expansibility, but among all ordinary metals the one of greatest expansion is zinc. Between 32° and 212° forged zinc expands one three hundred and twenty-first part of its length, or 0.374 inches in 10 feet. Our correspondent asked what would be the length of a certain bar of which he adds the diameter. The thickness of the metal, however, has nothing to do with the lineal expansion. It will be the same whether it was ¼ inch through or 10 feet through. A bar of forged zinc which was 12 inches long at 32° F. would be approximately 12 1/321 inches at 212°.

Difficulty With Drive Well.

From H. W. H., *Lynn, Mass.*—If "W. M.," of Little Falls, N. J., who reports trouble with his pump and well in *The Metal Worker*, February 17, used the point and strainer usually for sale at the supply stores he may find the trouble at the bottom of the well. I have experienced the same trouble, and upon looking for the cause discovered that in many cases the combined area of the holes in the strainer was not more than 60 per cent. of that of the pipe. By their being made so small, the gravel or sand more easily stops them up, thus reducing the supply of water to the pipe and pump, causing the pump to "kick back," as our men call it, even in places where the supply was ample and the lift less than 10 feet. I now have my strainers made

by drilling about 2 feet of the lower end of the well pipe full of $\frac{3}{16}$ to $\frac{5}{16}$ holes, usually about 80 for 1¼ inch wells, and find them both cheaper and more satisfactory. If troubled by sand in quantities that injure the valves of the pump, I place a Smith or other sand chamber under the pump.

From T. A. B., *Herkimer, N. Y.*—In regard to the trouble of "M. W," in *The Metal Worker*, February 17, with drive well, I would advise him to place the cylinder about 8 feet below the surface. Then use a common pitcher pump with rod the proper length attached to the plunger. If in clay soil this same trouble will occur, making it necessary to redrive.

Corrosion From Ice Drip.

From S. A. S., *New York*—We were called upon about a year and a half ago to reline with galvanized iron a box used as a drip catch to a very large ice box. We found the old lining good except in spots where the drip struck the box. We took the lining out, which was No. 28 galvanized iron, and substituted No. 24 galvanized, and in three months time this also was gone in the same spots. We then lined it with sheet lead, 4 pounds to the square foot, and in one year this also was in holes in the same spots. Please inform us of the cause and if sheet copper would be better than the above mentioned materials for this purpose.

Note.—It is possible that the trouble complained of is due to the fact that the dripping water carries away the protecting coating of oxide or carbonate of the metal that forms on the surface and so permits speedy corrosion. Where lead, for instance, is exposed to the atmosphere it will endure for an indefinite period, as the surface becomes coated with a carbonate which is practically insoluble, and prevents the air from getting at the lead itself. Where a drip of water takes place, however, it would be apt to carry off any soft coating by mechanical action, and it is possible that apart from corrosion the mere wearing action of the water is an explanation of the rapid destruction of the metal. We think that copper would prove a more enduring metal than either of the others in this case. If the trouble is due to the drops striking the metal, we would suggest that a remedy would be to put a piece of board above the lining where the dripping strikes so that the water hitting on a wooden surface will spray or run down on the metal.

Left Handed Tinners.

From JOHN S. BROOKS, *Brooklyn, N. Y.*—In reply to "Right Hand," in *The Metal Worker* of February 24, I can tell of my experience with a left handed boy and can see no good reason why it may not apply to another if he has the right instruction and perseverance. In 1852 I took an apprentice at Rochester named L. B. Grover, who is now dead, who was known as a good workman. When I found he was left handed I told his father I could not keep him and wished the papers canceled; but his father told me to keep him and that I need not pay him any wages and could charge him with any work spoiled or other loss. I consented to that and started the boy on a large lot of milk skimmers, insisting that he should hold the hammer for punching the holes and for raising them on the block in his right hand. The boy did it, having the stuff in him for a good workman, and the change to the use of the right hand never gave him or me any perceptible trouble. After he had worked a short time the necessity of using his right hand overcame the habit and even proved a benefit; and as I allowed him to use his left hand for a rest to the other, it ended in his being just as apt with one as with the other. At the end of his first year his father wanted him for his shoe store and offered me $100 to give up the contract, which I did, reluctantly, thinking it was for the boy's best interests. He had been in his father's store but a short time before he was competent to take measures, and became a skillful cutter, using either hand with the knife, and afterwards, by the changes of business fortune, went back to his first trade with success. This long story is more than an answer to "Right Hand," for it teaches a lesson to other boys that they must not get the idea that they can become good workmen without using all of their energy, and when they meet obstacles to surmount them by persistent determination. It also teaches employers to use discretion in selecting boys, and that a left handed one with brains is better than a right handed idiot.

From A. C. R., *Mt. Vernon, N. Y.*—In reply to "Right Hand," whose letter appears in *The Metal Worker* of February 24, I do not think his experience with left handed tinners can be taken very seriously. I, myself, am left handed, so much so that I do everything with it with the exception of one thing, and that is blessing myself. I have worked in a shop where there were four left handed tinners employed, and all good mechanics; but still, in all my 12 years' experience, I have never had to have any left handed tools made to order for my use.

Self Registering Thermometer.

From S. C., *Marshall, Texas.*—I would like to be informed in regard to an instrument I have seen for showing the temperature in which the mercury rises in a glass tube during cold weather instead of lowering as in the ordinary thermometer.

Answer.—Our correspondent has in mind one form of what is known as a self registering thermometer. This construction has indexes in the tube which stick at the highest and lowest temperatures, so as to give a permament record of the greatest degree of heat or cold. In the one that he presumably has in mind the thermometer consists of a long tubular bulb united to a smaller tube more than twice its length and bent twice like a syphon, so that the largest tube is in the center, while the smaller one terminates at the top in a bulb. This bulb and the tube connecting with it are partly filled with spirit, while the long central bulb and its connecting tube are completely filled with spirit and the lower portion of the syphon filled with mercury. As the temperature rises the long bulb expands and forces the mercury up in the column connecting with the partly filled bulb. As the temperature falls the spirit contracts in the central tube and the mercury follows it and consequently rises in the tube. The mercury in this case is nothing but an index, and the temperature is in reality indicated by the expansion and contraction of the spirit in the bulb.

What Caused the Collapse.

From F. M. P., *Cobleskill, N. Y.*—I write in answer to the question in *The Metal Worker*, February 10, "What Caused the Collapse?" The water was forced out of the boiler back into the tank in the attic by steam generated in the water front, and as the water went out the vacant space was filled with this steam. Now, there are two ways in which this steam could suddenly be condensed. The first is by opening a hot water faucet and thus relieving the steam pressure, and the other is by the water being forced out down to end of the tube and allowing the steam to pass up through the tube and supply pipe, thus relieving the pressure. In either case, after the steam pressure was removed the cold water began to flow back into the boiler through the tube, and this tube, which is now surrounded by steam, is chilled by the cold water passing through it, and causes the steam to condense very suddenly, leaving the boiler empty of either steam or water, rendering collapse inevitable. The first of these conditions probably obtained, as your correspondent says hot water had been drawn but a short time before the collapse occurred. The statement that the boiler was full of water when it collapsed, I do not believe. It might have been full up to the point where it "caved in," thus allowing the water to "spurt out of the hole made by the collapse," all pressure now being removed and the water flowing in from the tank. The remedy for this is the relief pipe, which must be connected with the hot water pipe, and carried up to and over the top of the tank, with end always above high water mark. The vacuum valve will not do, as it cannot possibly prevent the water being forced out of the boiler, and the consequent discoloring of the boiler by the hot steam. It might, however, prevent collapse, yet this is not certain when so large a vacuum is formed so suddenly.

Refrigerine.

From HANTZ & JESSOP, *York, Pa*—Could you give us any information in regard to a refrigerator using a composition called "refrigerine" instead of ice? We think that it is manufactured in Pittsburgh.

Note.—We have had inquiries made in Pittsburgh for the article mentioned by our correspondents, but fail to find any trace of it in that city. If any of our correspondents can supply the information we shall be glad to have them do so.

Roofing Fire Pots.

From F. W. S., *Bayfield, Wis.*—As this is a slack time for most tinners, I would like some of the boys to send to *The Metal Worker* drawings of a good roofing fire pot for charcoal, one got up exclusively for roofing.

Management of Men and Workshops.

Developing Skill.—Does it Pay?

BY THOS. D. WEST.

Few factors, injurious alike to the interest of employer and employees, can be cited than the lack of skill many men display in the manipulation of manufacture. Work requires more or less brain power in all industries. The more study and experience can develop skill the more valuable become the services and time of the workman.

When by investigation we find that there are but few industries that do not suffer for the want of good skilled employees, and that instead of progressing they are degenerating, it is very evident that a universal movement inaugurated among manufacturers to educate and develop skill would be as beneficial to the employee as the employer.

The work of man in the pursuit and maintenance of civilized life may be distinguished as that of the professional or the artisan. In obtaining education and skill to follow either, a course of schooling or training is necessary. While the former is taught in the college, the other is obtained in the factory or workshop. The ability and knowledge acquired upon entering life as a professional man or as an artisan depends upon the length of time given up to college discipline or trade apprenticeship. While in the artistic or professional pursuits the demands are constantly growing more exacting, with the artisans or tradesmen the reverse is the practice permitted to-day. The discussion of the causes is not the aim of this paper. Suffice it to say that the standard of ability and skill in many of the trades is lowering, for the old school of mechanics and good workmen are fast passing away.

The professional man is going up and the mechanic is going down. They are pulling apart from each other at an alarming rate, to the injury of all concerned. It surely is as essential for the mechanic to be a master of his calling as it is for the professional man to be of his. Probably it is the greater intelligence of the latter which accounts for the quicker appreciation of the advantages to be derived by the possession of knowledge and skill.

The fact that professional men, by often giving 25 years of early life to study or learning a profession, can often accumulate sufficient in ten years to make them independently wealthy, should cause artisans or mechanics to perceive that high wages should not be expected without a return of equivalent in ability for the wages received. If our most intelligent citizens recognize and follow the practice of giving up years of early life to study ere expecting recompense in after years, there must be some good reason for it. It is about time that the artisan commenced to connect cause and effect and make an effort to retard the too often downward course of artisans' skill. The employers should bring facts to the front to prove to their employees that it pays to expend sufficient time and energy in early life to become thoroughly proficient in a trade or occupation in order that middle life may be so remunerative as to make their last years yield to them independence.

I cannot but think that if this matter were rightly presented and taken hold of by employers, a great influence could be brought to bear on youths or beginners.

The lack of skill exhibited to-day in many of our industries is wholly due to the haste of beginners to receive what they call "man's wages." I think it safe to say that this predominates and is tolerated in America much more than in Europe. We find foreign tradesmen much more proficient in many of our callings than those schooled in America, because their apprenticeship years are more numerous than ours. In this country apprenticeship lasts from one month up to three years. The indifference which manufacturers seem to exhibit to this condition of affairs is not only injurious to themselves but to the workmen or employees, for the great majority never start young enough or stay long enough as apprentices at any trade to become sufficiently skilled to give an equivalent for good wages.

Just as quick as many can obtain an elementary knowledge of a trade, they go off to bluff their way through life, and as there is but little else on the market or running loose for hire, a firm generally must engage them. All through their engagement it is nothing but bickering, discontentment and strife to get out good work without loss of time and stock. As a general thing the unskilled employee is constantly asking for more money and raising a disturbance in general, for it is very seldom that one can find a "poor tool" capable of minding his own business or being satisfied with anything near the equivalent he gives for wages. Generally he thinks himself as good as the most proficient employee; such is characteristic of "poor tools." One is always safe in figuring for losses, contention and worry when they are about, but thanks to the occasional dull periods in business, the "poor tool's" services can then be dispensed with. The employer can then take a little pleasure in life or feel his soul is his own, while the "poor tool" becomes a tramp, seeking whom he can next worry and impose upon. But after all it becomes a question who is to be most sympathized with. Surely the "poor tool" ere he is "fired" many times and sees others retained in his place must commence to realize his mistake in not having given more time to perfecting himself in youth at his trade or calling.

This brings us back again to the question of haste exhibited by youth to enter manhood for the duties of life ere he is equipped sufficiently with knowledge and experience to make the fight. Thirty to fifty years back a youth never thought of anything other than serving five to seven years learning a trade, if it was at all worthy such a name, and not only was he generally "bound" to give such time, but in some cases we are told that in Europe he was liable to imprisonment should he attempt to run away. Instead of his receiving money, in many instances payment would be demanded from him in consideration of obtaining the privilege to secure a chance to learn a trade. In those days boys were not men, and they well knew that if they would attempt to assert independence before they had acquired knowledge to entitle them to having man's diplomas (experience and ability) they would receive such a set back that it would cause them to think there was much in the maxim, "He grew to the size of a man but had the brains of a goose." "The laborer is worthy of his hire" is far from the justice of enactment that existed in past years, for then the laborer himself figured upon giving an equivalent for every cent he received. To-day it is more figuring to "get in time."

There is not a sufficient number of skilled men for the work this world demands, and the "poor tools" by combination are not always going to be able to depress or hold down those of ability or skill. The attractions of this age over those of the past for labor are such that they should induce men to exert themselves to become skilled workmen, so as to receive the higher wages. It requires but little effort on the part of those who believe and realize that it is but just that experience and ability should be rewarded, to start the artisan in the direction of acquiring more proficiency in his calling. Of course, "poor tools" may improve themselves in some lines most every day, but at what a cost to the employer! Even then it generally would take ten years experience to gain the knowledge which could be obtained in one year through the proper apprenticeship, for two reasons: 1, that a young person grasps ideas, learns quicker and maintains knowledge longer than if obtained when an adult. 2, the simple matter of his being an apprentice implies that he is under instructions and has teachers who should give him attention and the value of their experience. An intelligent teacher can express in four or five words what he has learnt through years of practice.

You cannot as easily make skilled employees out of men as you can out of boys. I well know that many excuses are offered for the degeneration of skill. A good many cry, we don't have the opportunity, too much of specialty business going on. Isolate, fence them off, consider specialty shops as of another realm, and yet with present condititions it would be about the same old song, "I do wish I could hire a few good, experienced, skilled men; they are getting worse and worse every day."

It is not going to remedy matters to ignore the truth and set up a visionary ghost to scare us from the road which could lead us onward to improvement. If we want to create or make good, skilled employees, there should be more opportunities to-day than in the past. We can obtain to-day good and thorough information to understand the principles of nearly every trade. We need not simply practice imitating, as had to be done ten years back or further. We need not "go it blind" or be guided by "rule of thumb." We can know what should be done to meet with success. The old school had not the knowledge of science and principles nor the advantages which the workman can obtain to-day. What is most required at the present time is to have the apprentice attach more value to obtaining the privilege to fully or thoroughly learn a trade and less to the question of wages. He will then find that there are just as good opportunities for learning a trade now as in the times of the old school.

Through the costly teaching of experiment and experience the old school simply knew that work had to be done in a certain manner. Why? was a question very few, if any, were able to answer. Give us our old school of "bound apprenticeship" combined with our advanced knowledge of the principles and science of our trades and the best old school mechanics or skilled men could easily be surpassed by the new school in giving an equivalent for high wages.

But many employers are not clamoring at present for an improvement over

the old mechanics. Many of them would be well satisfied with men equal to the old mechanics. To obtain them we must turn back and pick up the diacipline that made skilled men out of boys many years back. What was that? I can surmise being asked by youth. It waa not a course, my young American buck, that, with your high strung notions, is expected to receive favor in your mind. But as you have asked the question I will tell you, and by putting the introduction in the shape of a "wild West" story, you may be interested sufficiently to follow me into starting into a solution of the problem.

Your first move is, of course, to hunt for an opening that will suit your inclination and talents; and before getting on the trail of it you will often meet many disappointments. Still, the experience you will receive will cause you to only appreciate the prize the more when obtained. Your adventures may lead you far from friends and home, but to atrive for honors you find accorded to the famed experienced old heads you must be willing to undergo any and all forms of sacrifice and hardship if only at the end you can come out a thoroughbred. Now to reach that in a trade is not achieved in a month, or in a year or two. In many occupations it requires from five to aeven years at low wages and endurance of hardships.

Now we wait your answer. Do you want to atart in? You will be left some privilege; you can kick once in a while, but if too many off goes your head, for remember there was no fooling or wasting time with boys having the "big head" when the rule of the old school was in force. Then you were not considered a man until you had obtained a fair amount of knowledge and good common aense. If you started at 14, at 21 you should possess it and enter manhood with aufficient knowledge and akill in your trade to command and give an equivalent in work for good wages. You would do as well starting with six years of apprenticeship at an average of only $6 per week, and following that with your first four years' wages as a journeyman or skilled artisan, averaging $18 per week, as you would had you served three years at $8 per week and the first seven years as a journeyman at $12 per week. The latter is large wages for the majority of "poor tools" that are turned out these daya in many trades. Figures will now show that in ten years the amount of money received is exactly the same in both cases. Now, before going further, I would ask if you can discover what could be deduced from the above. You hesitate; well it is simply this: That every day you now continue to work at the trade you average $1 per day more for your labor than if you had only served a three years' apprenticeship. Do you fully realize what this means? No? I thought so. It is just the way you have realized everything else that is best for your own interest. Well, as your past has proved how purblind you are to see any further ahead than your nose, I suppose we will have to knock it into you, and to do so we will suggest or allow you a life of 30 yeara more as a journeyman.

	Three-year aporenticeship.	Six-year apprenticeship.
Weeks in a year..	52	52
Wages per week.	$8.00	$6.00
Wages per year.	$416.00	$312.00
Years apprenticeship.	3	6
Total apprenticeship wages.	$1,248.00	$1,872.00

	Seven years journeymanship.	Four years journeymanship.
Weeks in a year.	52	52
One week's wages.	$12.00	$18.00
One year's wages.	$624 00	$936.00
Journeyman years.	7	4
Journeyman wages.	$4.368.00	$3,744.00
Apprenticeship wages.	1,248.00	1,872.00
Ten years' wages.	$5,616.00	$5,616.00
Thirty years' journeymanship.		
$3.00 per day		$28,080.00
2.00 per day		18,720.00
Bonus for ability and skill		$9,360.00

Having reached this point you cannot but perceive how dearly you have paid for thia "big head" privilege of which you thought so much while serving an apprenticeship of three months to three yeara. Here you aee just that because you could not deny yourself a little pleasure and independence in the firat years of your life you have sacrificed virtually $10,000, a young fortune actually thrown away.

You lost an opportunity of being "aomebody" who would be sought after, and by your akill be assured of steady work; inatead you go into the world as a "poor tool" to be knocked from pillar to poat; you will be more than likely to be half your time out of employment and the other half be an object for censure and abuse.

Youth is the schooling time of life. A rebuff is aimply given as a reprimand to awaken boya to make an effort to do better, but during manhood years rebukes are a slur on ability or akill, and in many cases lead to discharge.

It is best that they be received in youth, when forgotten in five minutes, while in manhood years they will ever be remembered and redound to their discredit and debar them from many of the comforts and pleasures they might have taken in the companionship of man, duties and responsibilities of life.

There is one element in the figures here presented which by a close reader may be called into question, and that is that one apprentice should average $8 per week for three years, while another ahould average only $6 per week for six years. Since a modern apprentice and hia backers insist on his receiving large wages, the employer, in order to not lose by the contract, gets the apprentice perfected in doing one thing just as quick aa he can. At that he keeps him just as long as he can, so as to get an equivalent in work out of him for the large apprentice wages he insists on receiving. Then, again, the proprietor, having no "bond" or guarantee that an apprentice will stay any more than a day or a month, often finds it necessary to get all out of the apprentice that is possible while he may remain. If he only knew that the apprentice was to atay a definite long time it would, generally speaking, be to the employer's interest to start him in at the bottom and gradually work him up to the top, with practice in every line of his work. If the employee will only reason this out he cannot but perceive the common sense of such a position. This may be "letting a cat out of the bad," but the secret is now divulged and it should be a pointer to not be too exacting in the question of wages, but to try to get a chance at more than one thing in a firm's manufacture. In fact, endeavor to secure a chance at learning and having practice in all that may pertain to the trade or calling. This working or having experience at only one or two things in a trade is what "floods our lands" with "poor tools," and causes many to have a smattering of several trades. They master none because they float from one to another trade in the hope of bettering themselves.

Let a chance to thoroughly learn all there is in a business be our first consideration, and the question of wages come second, as was the practice of the old school. In the end it does pay to develop ability, and now more than ever should the employer and employee labor to develop the much required skill, for in this question their interests or welfare are at least mutual.

One of the results of the International Congress of Education in Chicago last summer is the organization of the Manual Training Teachers' Association of America, to secure the development of manual training in the educational aystem of the United States. At a meeting held in Cincinnati last week the association waa formally organized, the plan and scope of the association were considered and a constitution waa adopted. The officers of the association — Geo. B. Kilton, Springfield, Mass., president; Geo. S. Waite, Toledo, vice-president, and Geo. Robbins, Frankfort, Ky., secretary and treasurer—constitute the Executive Committee, which is now making arrangements for a aummer meeting.

Secretary Carter of the Maryland Board of Health has compiled the following statistics showing the mortality in various cities of the United States and Europe having a population of more than 100,000:

	Population.	Deaths.	Death rate per 1,000.
London	5,849,101	55,895	19.11
Paris	2,424,705	28,675	23 61
New York	1,801,739	23,856	26.47
Berlin	1,669,124	17,181	20.58
Chicago	1,458,000	13,590	18.95
Vienna	1,435,931	18,005	25 07
Philadelphia	1,115,562	12,249	21.95
Brooklyn	978,394	10,685	21.84
St. Louis	520,000	4,802	18.47
Brussels	488,188	4,359	17.86
Boston	487,397	5,816	23.88
Baltimore	455,427	4,806	21.10
Dublin	349,594	4,735	27.05
San Francisco	330,000	3,006	18.21
Cincinnati	305,000	3,000	19,67
Cleveland	290,000	2,538	18.19
Buffalo	290,000	2,361	16.28
Pittsburgh	255,000	2,923	22.92
New Orleans	254,000	3,598	28.72
Edinburgh	267,000	2,572	19.22
Milwaukee	250,000	2,000	16.00
Louisville	227,000	1,630	14.80
Minneapolis	209,000	1,004	9 60
St. Paul	155,000	745	9.61
Christiania, Norway	156,500	1,385	17.75
Denver, Col	150,000	871	11.61
Rochester, N. Y	144,834	1,291	17.87
Reims, France	105,498	1,503	28.62

A Brooklyn, N. Y., firm of coal dealers have instituted a sensible and cleanly method of delivering coal to householders in bags. This new departure is much appreciated, as being a decided improvement over the old dirty and inconvenient practice of dumping the coal on the sidewalk and shoveling it from thence into the cellar or coal bin. Delivery of coal in bags prevails almost generally on the other side of the water.

The city of Trenton, N. J., is suffering severely from the suspension of her pottery industries. Twenty potteries are closed down, as well as a number of brick and decorating yards. Fully one-half of the city's working population is reported as idle, and much distress prevails, 1000 entire families being fed and supported by the Citizens' Relief Committee.

STEAM AND HOT WATER.

Warming and Ventilation.*—II.

(Concluded from The Metal Worker February 17.)

The Plenum System and its Modifications.

The whole of the fresh air is taken at one central place, where it is also filtered and warmed, and is then propelled by a fan into the rooms, out of which it forces the whole body of vitiated air. Each room has its separate polluted air flue, which leads upward, and allows the foul air to be discharged into the open air. The heating is done by low pressure steam.

In the case of the Melbourne Road Board School, Leicester, the fresh air is admitted through a shaft 12 feet from the ground and 26 superficial feet, at the bottom of which a coarse filter of jute cloth is fixed. The latter may be fitted with a water supply, so as to still further arrest the floating impurities in the incoming air, and wash the jute screen. Through this the air is drawn by the open bladed fan driven by a 5 horse-power gas engine, which latter is really larger than necessary, but has given very good and economical results. The fan is 5 feet in diameter, and is run during the cold weather at 250 and during the warm weather at 325 revolutions per minute. It propels the air forward into the large underground trunk, which forms a circuit under the school.

This main duct is 5 feet wide by 6 feet 6 inches high, its bottom is formed of concrete faced with cement, its sides of good brick work and the top is covered with concrete slabs; it is kept spotlessly clean and the sides are whitewashed from time to time. It will be noticed that the extra constructional work is not great in this case, the inner wall only having to be built, the outer wall being taken down a little deeper than would have been the case without such a system.

In this main duct and at the bottom of the several upcast shafts are placed the heating batteries and coils, which are supplied with steam from a Cornish boiler fixed in a sub-basement so as to allow the condensed water to return to it by gravitation. As there is no water wasted in this arrangement, it is seldom replenished in the boiler—say once a month. As there is so little fresh water used in the boiler, no deposit to speak of is formed, hence there is no trouble in cleaning out the boiler.

The boiler is of the Cornish type and is usually worked at a pressure of 5 pounds per square inch; sometimes, however, it has happened that the gauge indicated no pressure at all and yet the batteries and coils were warm. The steam service works absolutely noiselessly, and there have been no broken or leaky joints since the apparatus was set to work. The steam main is run right round the underground trunk and great care is taken in the laying of it, the pipe being anchored at each end, whereas in the middle special compensators are fixed to allow for the expansion and contraction. At every rise in the main pipe a special fitting is fixed, called a "fixed point," which is dripped; this drip pipe communicates direct with the return, which is run at the bottom of the duct and is connected with the boiler just below the water line. A great deal might be said about the proper laying of steam pipes, but time will not permit of it here.

All the class rooms are heated by these batteries, which are placed, as already stated, in the main underground duct, but the large halls are heated by direct radiators, which are fixed on the respective floors in such a position that the partially warmed air of the trunk enters the room through gratings under them. In these large halls, where the number of children taught is small in proportion to its size, this plan of keeping them warm has been found more economical than if they were heated from batteries in the basement; it also admits of these rooms being warmed independently of the fan, which is an advantage at times, and has the desirable effect of warming the walls. The staircases, corridors, lavatories and cloak rooms are also heated by direct radiators.

The inlets for the fresh air are fixed about 8 feet above floor level in all class rooms, and there are two sets of outlets provided on the same side for the vitiated air, so that it can be either forced out near the bottom or near the top of the room. From experiments and from actual work it was found that the best results were obtained when the vitiated air was taken off near floor level, which cannot be surprising when the amount of dirt and dust which every day collects on the floor of a board school is borne in mind. This, together with the emanations from the skin and lungs of the children, are not allowed to rise and pollute the air, but are removed before they can do harm.

The action of the incoming air is rapidly upward and across the room, spreading itself out as it passes toward the outer walls and windows, thence flowing down their cooler surfaces to the floor and rising slightly again, it eddies across the room in waves to the outlet grating, through which it is forced out. By this method all the air entering is made to circulate throughout the room before it reaches the exhaust shaft, and there is a constant movement and mixing of the air going on in all parts of the room.

The temperature of the rooms is kept at about 60° F., and there has been no difficulty whatever in obtaining this temperature in a single room by 9 o'clock in the morning, even on the coldest day. In most schools the caretaker has to be at his boiler by 5 30 or 6 o'clock, but in this case he does not attend to it before 7 a.m. If the temperature in a class room requires altering the head master telephones down to the caretaker, who raises or lowers it according to requirements without altering the volume of air supplied and without interfering with the temperature in any other room.

The number of children at the Melbourne Road Board School is 1700, the consumption of coal ½ ton a day, and the cost of gas, oil, waste, &c., about 6 shillings per week.

The success of any installation of the plenum system depends, in the first instance, on the manner it has been designed and carried out, and in the second, on the way it is worked and maintained from year to year, and a few remarks on some points of importance in designing and carrying out large schemes may not be out of place.

1. As to ducts and flues: All the ducts and flues must be large enough for the quantity of air they have to pass at a moderate velocity, and must be so constructed that they can be kept perfectly clean in every part without any difficulty, and limewashed for disinfecting purposes should this be required. The main duct should be large enough to admit a man comfortably, and all vertical flues should rise directly from it. If the flues are dirty or can only be cleaned out with difficulty, then the system is sure to prove a failure.

2. As to inlets and outlets. These should be large enough to admit the air in sufficient quantities at the proper rate of speed. If they are too small the air will have to pass in and out at a high velocity, which is sure to cause an unpleasant noise, and may cause drafts. They must also be placed in such a position as will insure perfect diffusion throughout the room, and perhaps the best way to obtain this in a general way is to fix them in one and the same wall at opposite corners. As a rule, the inlet openings should be near the ceiling and the outlets near the floor, but in special cases this position may have to be reversed.

3. As to connections between fresh air and foul air flues. Great care must be taken that these two kinds of flues have no connection, which may be caused through carelessly laid brick work, at points where they cross each other.

4. As to filters: The idea of filtering the fresh air is a very old one and there are a great variety of filters at work, from the simplest form to the most complicated. It should be borne in mind in selecting one that the finer it is the more power will be required to draw air through, and the sooner will its pores become choked. The experience gained with the filters described has been decidedly satisfactory, and they might be employed, or a filter might be chosen similar to the one in use in the Victoria Infirmary, Glasgow, care being taken not to over moisten the atmosphere.

A great many objections have been raised against the plenum system, not infrequently by those who are patentees of other ventilating appliances, and it would be useless to discuss them all, but there are one or two which it might not be out of place to consider here.

1. As to breakdowns of the machinery. It has been stated that if the engine breaks down, no fresh air can be supplied till it is repaired. In this respect natural or mechanical schemes

* Paper read by Mr. Ashwell before the British Association for the Advancement of science.

of ventilation, with this advantage, perhaps, that an accident to the machinery is at once noticed, and can be remedied without delay, whereas a breakdown in a patent cowl or some such appliance may not be noticed for a considerable time, as nobody attends to it. It would, however, not be true to say that during a breakdown no fresh air at all will be supplied. This would only be the case during the warm weather, and then the opening of the windows would soon remedy it. During a breakdown in winter the hot air will still, to some extent, ventilate the rooms till the repairs are complete. This would be the condition of things in cases where no duplicate power is provided, but where this has been done —either by an extraction tower as at Nottingham, or by a fan in the roof driven by the electric motor, or by a duplicate engine at the air inlet— then no inconvenience at all will be felt during repairs; and though this course will prove somewhat more expensive at first, yet in the long run it will be the cheapest, and should be adopted in all cases where a temporarily reduced supply of fresh air entails hardship or danger to life. If this is done, then it may safely be asserted that the plenum system is the most reliable system of ventilation.

2. As to scheme being too complicated. It is quite true that any scheme of mechanical ventilation is more complicated than schemes of natural or so-called automatic ventilation; but plenum schemes are by no means too complicated for successful working, as is proved by the experience gained in all parts of the globe.

To say that a natural scheme of ventilation is uninterruptedly at work all the year round is, to say the least, very misleading. It may be true that the atmosphere is always in motion, but then this motion may be so infinitesimally small at times as to cause no movement of air at all in outbuildings, a state of affairs well known to all those who have to rely on this kind of ventilation.

The addition of the machinery is a safeguard for the regular supply of air in the proper quantities, and it is far better and wiser in all matters concerning so immediately the health of countless thousands as ventilation does, to have a special man constantly attending to it, rather than leave it to itself and all sorts of mishaps.

3. As to cost of scheme. It is undoubtedly a most important matter to consider very carefully the cost of any ventilation scheme; but when comparing the expenses in connection with two different modes of ventilation for one building great care must be taken to place the two schemes exactly, as far as this is possible, on the same basis as to the purity of air supplied, the quantity, the regularity, the convenience of working them, &c. If this is not done the results obtained will be utterly useless and misleading; but wherever this is done, and all the circumstances of the case considered, the author is confident that the expenses in connection with the plenum system will not be found excessive. He had not prepared any figures, as he is of opinion that general figures are frequently totally misleading, and for this reason he would recommend the consideration of the question of cost afresh for each particular case.

The Brandt Submerged Water Heating Company of Toledo were incorporated recently. The object is the manufacture and sale of the Brandt submerged water heater in the territory east of the Mississippi, except Virginia and South Carolina.

Radiator on Boiler Level.

From Broomell, Schmidt & Co., Limited, *York, Pa.*—We have noticed with interest the communications and illustrations which have appeared in *The Metal Worker* in regard to the matter of heating radiators on a boiler level. One of the specialties which we manufacture is the Heatencook range (house heating from the kitchen fire). In this system it is necessary to use all of the first floor radiators on a level with the heater. We have over 100 jobs working on this plan, all of which are giving excellent and continued satisfaction. The proper plan for this work is to run the flow pipe to the attic and drop from this pipe to radiators below, or to run it under the ceiling of second floor, supplying third floor radiators from below and dropping to radiators on second floor and first floor. It is a mistake to connect flow pipes with a by pass under radiators, because the radiator above will work very unsatisfactorily. While it will take a little more pipe, it is better to run independent return pipes from as many radiators as possible, connecting these return pipes into the main return in cellar. We find that if the return from a small radiator on second floor is connected into the return of larger radiator on first floor the water will come down hot from the second floor radiator before the first floor radiator is hot all over, and the tendency is for the first floor radiator to heat from both ends, making a sluggish circulation and poorly heated radiator.

Feed Water Heaters.

BY L. A. N.

Comparatively few boilers used for heating purposes require to use feed water heaters. All such as are employed in gravity return systems, or where the water of condensation is returned to the boiler by a trap, being thus supplied with heated water, do not need feed water heaters. In rare instances, as in some large heating plants, a return system is not used and the water of condensation is trapped out and allowed to run to waste. This is sometimes the case also in smaller heating plants, so situated that the water of condensation cannot be conveniently returned to the boiler. In all such cases a feed water heater, besides preserving the usefulness of the boiler for a longer period, will be found an economical appliance, and, whether used for heating or for power, no boiler whatever should be fed with cold water.

People, as a rule, are willing to concede that a boiler fed with hot water will last longer than when fed with cold water. They also will admit that, because heating feed water prevents or greatly lessens the formation of scale in boilers, a boiler supplied with a feed water heater will steam more economically than without it. But there is a point in favor of feed water heaters not frequently considered. Any one familiar with the laws that govern the heating of liquids in boilers must see, upon due reflection, that the circulation in a boiler fed with cold water must differ greatly from that in a boiler where the temperature of the feed approximates the mean temperature of the contained water. If a quantity of cold water be injected into a steam generator it immediately seeks the bottom, forming there a layer which supports upon its upper surface the previously heated water, thus more or less separating the latter from direct contact with the most effective heating surface. In other words, the coldest part of the contained liquid is brought into contact with the most effective surface, which precisely reverses the condition of highest efficiency, so far as it depends upon the contact of the liquid with the heating surface.

When the liquid flows over a surface no hotter, or only a very little hotter, than itself, either no heat all, or a very little, is transferred to it; whereas, if passed over a much hotter surface it would rapidly take up heat. The cooler feed water, on the contrary, might take up considerable heat, if passed over the same surface. A cold layer of water at the bottom will have set up in it only a limited circulation between the bottom and the hotter water, because it will require considerable time to heat the cooler liquid to a degree that will render it light enough to rise to the level where the steam is liberated in the steam space. The time required will be much longer than with hot feed water, and hence, with the latter, the circulation will be far more active. As not only the rapidity of steam generation, but also the efficiency of boilers largely depends upon activity of circulation, it must be conceded that herein is an element of economy entirely independent of those usually allowed for heating feed water.

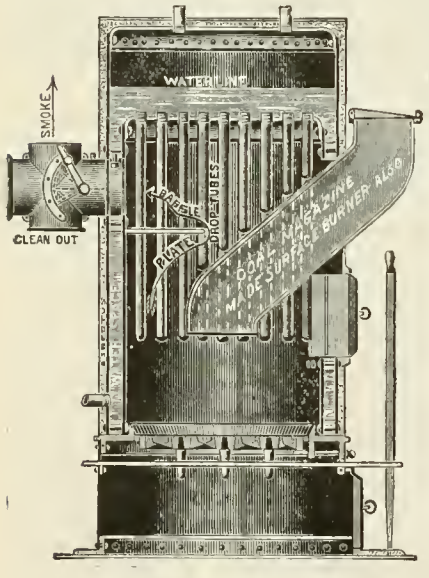
The Smith & Winchester Company,

Boston, Mass., issue a vary sumptuous volume relating to the goods that they handle. The book is an illustrated catalogue and price-list, 8 x 11 inches in size, and is handsomely bound in cloth. It is the second illustrated catalogue issued by this firm, and embraces all materials and tools commonly used in steam, gas, water and plumbing work. The lists in it are revised up to the date of issue and it is expected that few changes are likely to occur in the near future, though, of course, the lists and discounts are subject to change without notice. The frontispage is an engraving of a wind engine of the date A.D. 1700, and is a very quaint and interesting mill. At the beginning of the volume is a complete alphabetical index, covering some 12 pages. The catalogue proper begins with pipe, sections being given showing the thickness and sizes of wrought iron pipe, together with tables. These are followed by fittings of all sorts, malleable and cast, for various purposes. The next line of goods are valves and cocks, over 70 pages being given to this one department, showing how thoroughly the ground is covered. A large variety of steam specialties are included in this connection, such as governors, gauge columns, injectors, &c. Radiators are given a number of pages, many styles of direct and indirect being presented. Radiator valves are shown in great variety. Beginning with the plumbing department, which is on page 198, some 70 pages are given up to cocks, bibbs, stops and this class of goods. Bathtubs follow, many different kinds of shower baths, bath fixtures, lavatories, brackets, &c., being shown; next basins, closets, closet tanks. Cast iron soil pipe, traps and fittings are comprehensively treated, as well as

other cast iron goods, such as sinks, sink fixtures and bowls; miscellaneous goods in the line of boilers, towel racks and pipe hangers. Then come kitchen sink hoppers, followed by lead pipe, traps and bends and sheet metal pipes. Plumbers' and 'steam and gas fitters' tools comprehend a very complete line of these goods; in fact, some 50 pages are given up to that class of articles, including everything from a plain chisel and simple tools up to power machines. The pump department is particularly exhaustive, including over 100 pages. Hand pumps, power pumps, rams, &c., are included. Hydrants are given full attention, also driven well supplies; iron railings, hitching posts and crestings are noted. The end of the book, excluding a few pages given up to greenhouse fittings, is devoted to the wind engine department, which shows half tone engravings of many different types of wind mills. Scattered among the modern wind engines are several illustrations of old wind mills, such as were used 100 or more years ago, and which add very much to the interest of the department. Altogether the book is most thorough and complete, and will be welcomed by the trade.

The Keystone Heating Boiler.

We show in the accompanying illustration a sectional view of the Keystone heating boiler made by Broomell,



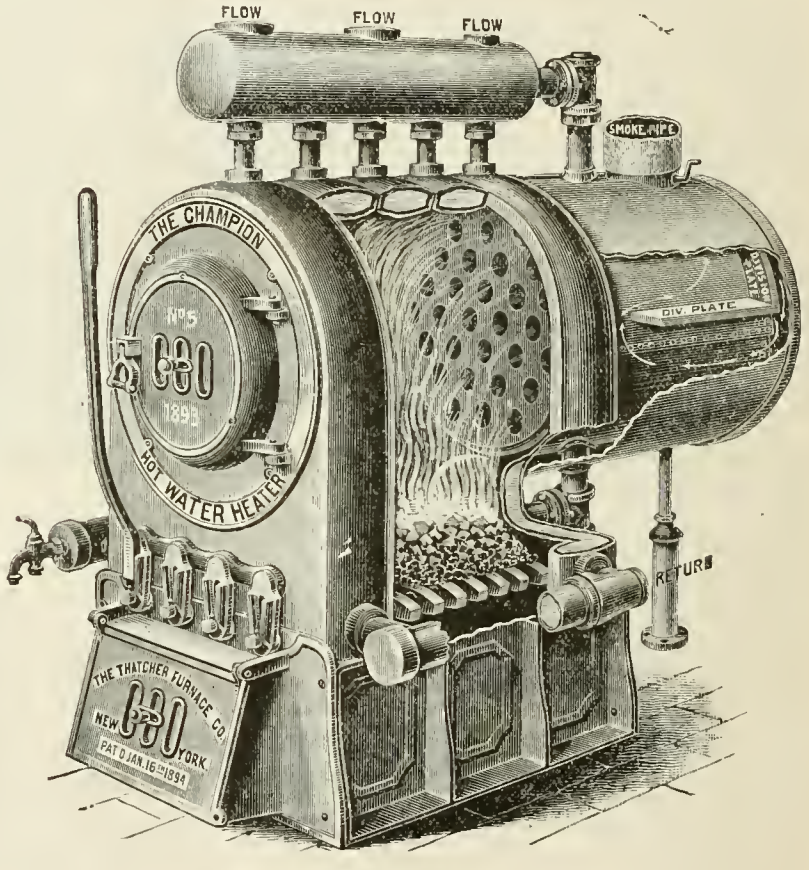
The Keystone Heating Boiler.—Sectional View of Boiler.

Schmidt & Co., Limited, York, Pa., with Philadelphia office at 146 North Third street. The illustration shows the boiler with a magazine feed and adapted to steam. It is, however, made without magazine, and for hot water as well as steam. In fact, the manufacturers prefer to supply the surface burning boiler, as it is the more economical in the use of coal. The boiler was designed to meet the demand for a heater that should not require brickwork. It is made of steel, and an especial point claimed for it is the large fire pot. The boiler proper, it will be noticed, consists of an annular water space with a drum at the top, to which drop tubes are connected. A baffle plate, as shown in the illustration, is placed on the drop tubes, extending half way to the front of the boiler and just below the opening for the smoke outlet, thus forcing the products of combustion to come in contact with all of the tubes. Particular attention is directed to the shaking and dumping grate, the grate bars being made with a double backbone, with air space in the center, and, it is claimed, will not warp or twist. The coal magazine is so arranged that it can be lifted out at any time, and when removed all the tubes are accessible for examination or cleaning. Another feature to which attention is directed is the patent combined smoke elbow and damper shown at the left of the cut. It is placed out of the way of the steam pipe connection and fittings, which enables the boiler to be set up in very low cellars. The smoke pipes to chimney can be attached to the top, bottom or side elbows, always leaving two openings available for cleaning the pipe or the top of the baffle plate. The manufacturers also direct attention to the damper shown in the cut. When the damper is wide open the cold air check doors on either side of the boiler are shut. As soon as the damper begins to close the check doors open and when the damper is closed entirely the cold air openings are full size. This combination of elbow and damper in connection with the automatic regulator furnished, it is claimed, control the draft and fire with great accuracy. Outside of the boiler, as shown, is a non-conducting jacket made of heavy galvanized iron, with a space between the jacket and steel shell filled in with asbestos sponge. The boilers are made for both hard and soft coal. The steam boilers are made in five sizes with diameter of fire pot 18 to 35 inches. The hot water boilers are made in the same sizes.

H. P. Blair and D. A. Westbury have formed a partnership under the firm name of H. P. Blair & Co. and opened a steam fitting and plumbing establishment at 118 Colfax avenue, South Bend, Ind.

The Champion Heater.

One of the newest candidates for favor in the heating trades is the Champion hot water and steam heater, illustrated in the accompanying cut. The apparatus, which has already been satisfactorily tested for both steam and hot water in a number of residences, is made by the Thatcher Furnace Company, 33 Peck slip, New York, who secured patents on January 16 for a combination of cast iron sections and a horizontal tubular return flue boiler. The cast iron sections are connected by nipples, with return headers at each side at the bottom and a flow header at the top, and a horizontal



The Champion Heater.

tubular section connects with the back cast iron section at the bottom and the flow header at the top. The back cast section is solid across the bottom and has a circular opening above, permitting a free entrance of the gases to the tubes in the horizontal section, which is enveloped in a shell, with flue plates so arranged as to give a direct draft or effect a passage down and to the front of a division plate, thus reaching all of the surface of the boiler as the gases escape to the chimney. Putting coal on the fire is made easy by an extra large door, which is to enable the flues in the tubular portion to be readily cleaned, while an opening at the back also gives access to the tubes and the indirect flues. The boilers have large combustion chambers, permitting the gases to be thoroughly ignited before they enter the tubes. The fire chamber is made 20 and 30 inches wide and increases 6 inches in length with each section, giving ample grate area for the surface exposed. A lever working grate is pro-

vided that is readily removed and there is a large ash pit. In the steam heater the top row of tubes is omitted, so that no tubes will be above the water line, and an automatic draft regulator is provided. The steam gauge is connected at the top and the water gauge at the right side connected on a level with the hinges of the fire door. The Champion is made in 12 sizes, the first 7 have respectively a hight of 54 inches and a width of fire chamber of 20 inches, while the larger sizes are 64 inches high and have a 30-inch fire chamber. The radiation they will carry is said to be very conservatively estimated and varies from 150 to 2000 feet for steam and from 250 to 3500 feet for hot water.

H. B. Smith Company.

We are indebted to the H. B. Smith Company, Westfield, Mass., for a copy of their lately issued handbook. The scope of this volume is well expressed in the following sentence, which we quote from the introductory notice: "This handbook was published for the purpose of combining within a limited space as much useful and practical information with regard to our manufactures as could be thus assembled, believing that such publication would correspond to the desires of our customers and work to our mutual convenience and advantage." In the present volume they have fulfilled this promise with unusual fidelity, for the publication is of a handy size, measuring 7 x 4½ inches, and is marked by simplicity and compactness. Although there are over 170 pages in it its thickness is less than ¼ inch, including the heavy binding of soft leather. It has evidently been the design of the publishers to present brief and accurate descriptions of their apparatus, and let the illustrations and few particulars of construction bear witness to the merits of the goods. As is well known, the H. B. Smith Company are makers of a large variety of heating boilers. The first section in the pamphlet is devoted to the Gold X L boilers; then come the Mercer boilers, then the Mills boilers; next the O K boilers and then the Cottage boilers. Following the boilers a section is devoted to Reed's patent rotating grate, followed by direct radiators, covering 30 pages; next the Whittier radiators; next indirect radiators, the latter covering 18 pages Breckenridge's automatic air valves are next noted, and the little volume closes with rules and practical data, some of the tables among the latter being particularly valuable.

HEATING NOTES.

The William H. Page Boiler Company, Norwich, Conn., send us a circular bearing extracts from the Portsmouth *Times* of January 10, 1894, giving letters from two persons in Portsmouth who have recently had Volunteer hot water boilers installed in their houses by J. M. Smith of that city. In both cases the writers speak in the highest terms of the apparatus.

L. S Bunker of the Bunker & Hazard Company, Webster City, Iowa, is stated by a local journal to have invented a sheet steel hot water and steam radiator which is claimed to have advantages in cost and radiating qualities over other forms of construction. The principle on which it is made is said to be an entirely new departure.

The Rex Heating Company, 85 Centre street, New York, are issuing a catalogue of 12 pages in a red cover devoted to the Rex hot water heaters that are specially adapted for small dwellings, stores, offices, bathrooms, conservatories and poultry houses. The illustrations show them in section and the various ways in which they are used.

The officers of the Herendeen Mfg. Company of Geneva, N. Y., for the ensuing year are: President E. W. Herendeen; treasurer, W. L. Herendeen; secretary. F. A. Herendeen; superintendent, F. J. Furman. The New York office of the company is room 46 in the Taylor Building, at 41 Cortlandt street, and is in charge of J. G. & A. H. Dudley. Some changes have been made in the process of manufacture of their Faultless Furman line and their plant extended and new machinery added. They have made some specially large boilers that will be used in the Harder Building, at 126 to 130 White street, New York.

F. Richter & Son, 382 to 400 Sixth street, Milwaukee, Wis., have recently taken some important heating contracts. They secured the Tenth Ward school house in the city of Milwaukee, and have also been awarded the contract to heat the Wisconsin Bridge & Iron Company's plant at North Milwaukee. They have invented a new fan system of heating for which they claim many advantages over older systems, the main point being that it is a cavity system when the fan is not in operation, obviating the necessity of direct radiation. They agree to change the air in a building every ten minutes and to furnish 30 cubic feet of air every minute to each pupil in the schoolroom. The apparatus is also constructed so as to automatically regulate the temperature of each room to the degree that may be desired. Not the least important feature of this system is its comparative cheapness. J. T. Ryan is manager of the heating department of he firm.

The American Boiler Company are to remove their Chicago office and salesroom from 34-36 Dearborn street to 84 Lake street.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

Mulligan & Schermerhorn, Troy, N. Y., are installing a heating plant in the residence of W. F. Burden, Newport, R. I., using two No. 6 Gorton steam boilers. A No. 2 was installed in his stable by them last fall.

McMann & Taylor, 42 Cliff street, New York, dealers in plumbers' and steam fitters' supplies, are furnishing all the materials for water and drain pipes in the Manhattan Life Insurance Company, in lower Broadway, just below Wall street. This colossal building will have the wrought iron drainage system, the bore of the fittings being the same as the pipe, minimizing the risk of stoppages at the joints. The plumbers having the contract are J. N. Knight & Son, 755 Seventh avenue, New York.

Fred Stoyle, Houghton, Mich., has the contract for resetting the boiler and rearranging the heating plant in the mining school building in that place.

W. J. Van Kewren has drawn the plans and will supervise the erection of a building to cost $75,000 and covering a space 83 x 248 feet, at Lake and Forest avenue, Chicago. The building will contain society halls, an auditorium and several apartment flats and will be heated by steam.

Bids will be received up to March 9 for heating and ventilating a four-room addition to the Butler Street School building at Lowell, Mass.

D. E. McNamara has been awarded the contract for doing the plumbing in the new addition to the Post Office building at New Haven, Conn.

Donohue Bros. are overhauling the plumbing of the Glendower Hotel, at Springfield, Mass., and putting it in a perfect sanitary condition.

The New York House, at 244 Water street, of the Raymond & Campbell Mfg. Company, Middletown, Pa., installed their Sun steam heaters in the Whalan Apartment House, a five story building, 50 x 100 feet, and in the store of Whalan Bros., at 155 Smith street, Brooklyn, a five-story building, 50 x 200 feet.

Gardenier & Vermullen, Paterson, N. J., are installing one of the Thatcher Furnace Company's champion steam heaters in the Eden Musee of that city. One thousand three hundred feet of direct radiation will be used and 500 feet of indirect.

The Philadelphia Steam Heating Company of Philadelphia have about completed the heating of the new mansion of John Pitcairn, at Bethayres, Pa. The building is in an exposed situation, and the indirect system of steam heating is employed. Two No. 5 Dunning boilers are used.

The contract for heating the Boardman Training School, at New Haven, Conn., has been awarded to the New Haven Steam Heating Company by the Selectmen.

The Kelly & Jones Company, 48-52 North Clinton street, Chicago, are to furnish a direct and indirect system of steam heating in the residence of E. A. Hammil, 2637 Prairie avenue.

The Wells & Newton Company, 274 Dearborn street, Chicago, are to furnish the plumbing and gas fitting in the new armory, Michigan avenue and Sixteenth street and Pierpont apartment building, Barry and Evanston avenues.

Among the contracts for hot water heating lately taken by the Theo. Jacobs Company, 72 74 Market street, Chicago, can be mentioned the following: Residence of Gustave Hesset, Lake View, and residence of C. H. Fitzhugh, Lake Forest, Ill.

Geo. Siegel, Carlinville, Ill., has secured the contract for the steam heating in Mr. Mueller's residence. A Florida boiler will be used.

The Rockford Construction Company, Rockford, Ill., are to install two No. 45 Spence boilers for the hot water heating in the residence of Mr. St. John.

Contracts for plumbing and gas fitting in the new National Union Building, at Toledo, Ohio, were let by the Building Board at a recent meeting. J. W. Groenwald, the St. Clair street plumber, put in the lowest bid, $4200, and was awarded the contract.

Sabine & Harvey, Boonville, who are about to locate at 74 South street, Utica, N. Y., have secured the plumbing contract for the large hotel of C. M. Barrett & Co., Third Lake, Fulton Chain, N. Y.

PLUMBING and GAS FITTING.

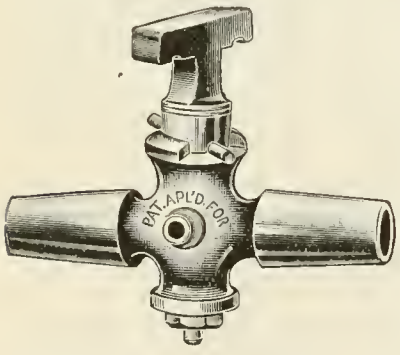
Maryland State Plumbing Commission.

The State Board of Commissioners of Practical Plumbing have prepared their report to the Governor. The board is composed of Dr. John Morris, president; Wm. H. Rothrock, secretary; Dr. J. F. McShane, John Trainor and John M Haupt. In their report the board say: During the year 1892 the board examined 407 applicants, issued 397 certificates, rejected 17 and deferred 11. During 1893 the number examined was 339, of which number 324 received certificates and 15 were rejected.

The law is a necessary and popular one, and if intelligently and honestly carried into effect must result in great good to the public. Although not many convictions have been secured, owing to the peculiar constitution of juries, the law has acted as a deterring influence, and our citizens have been protected in a very large measure from the ignorance and unscrupulousness of incompetent mechanics. The examinations of the board have not been unduly rigid, for the reason that the board did not deem it advisable to deprive men who had been engaged in plumbing for years before the enactment of the law of a means of livelihood. It is believed, however, that a class of young men are coming on who will be more thoroughly educated in sanitary knowledge, and who will be able to fulfill scientifically and intelligently all the requirements of their calling.

The Perfect Check and Waste.

The accompsnying cut shows a new check and waste manufactured by the Perfect Check & Waste Company, 189

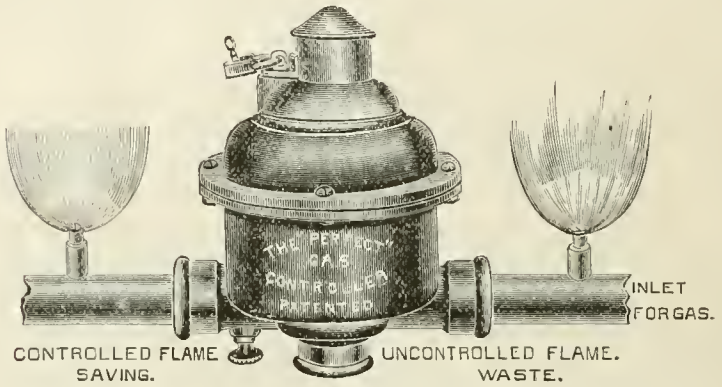


Perfect Check and Waste.

and 191 La Salle street, room 92, Chicago. It will be observed that this check is double guarded, and it is, therefore, specially adapted to contract or jobbing work, as the guard cannot be broken by even the most careless mechanic or tenant, thus overcoming a great annoyance at present encountered by the trade. It is furthermore pointed out that it cannot become set, because the double guard acts as an axle, and the weight of the rod cannot depress the core or allow it to become set. The top of the check being rounded, it presents a free passage for the wire, with no sharp corners to cut the wire when the rod is in a leaning position.

The Perfect Gas Controller.

The Brownhill Company, 141 and 143 Ontario street, Chicago, are manufacturing, under the name of the Perfect gas controller, a new device for regulating the pressure of gas on a consumer's premises. Illustrations are herewith presented, Fig. 1 showing the controller and Flg. 2 giving a sectional view to demonstrate the principle on which it operates. It is an automatic tap, intended to be fixed to the gas service pipe, opening or closing as the lights in the house are turned on or off and as the pressure increases or decreases from the street main. As the same pressure of gas is not required for, say, two or three burners as for ten to twelve, it is reasonable that a given number of outlets in a house cannot require a force of gas three times greater at one period of the evening than at another. Yet ordinarily there is no arrangement provided by which the pressure is controlled and the supply of gas fed to the burners just as required for the service. There is no question that under such circumstances much more gas is burned than necessary when but few burners are used, and a consumer does not reap the full benefit of his economy in extinguishing other lights. But a more potent cause of excessive gas bills is the great pressure often applied by gas companies to enable them to force gas to consumers located at a great distance from the works. The device made by the Brownhill Company is to reduce and regulate the gas pressure and is claimed to be simple and durable. The parts are interchangeable and can be replaced by any one without removing the body from the pipes. It is stated to be as applicable for ten burners as for 1000. All sizes are made from those to be applied to ⅛-inch pipes up to 4 inches or even larger if desired.



The Perfect Gas Controller.—Fig. 1.—General View of Controller.

The sectional cut, Fig. 2, is thus explained: A, outer casing or body of controller; A1, lid or cover; B, mercury trough; B1, mercury, which is poured in through inlet O after the controller is fixed in position; C, cover to mercury trough, removable for cleaning if necessary; P, valve box, also removable; E E, double inlet for gas; F F, equilibrium valve arranged to secure a steady flow of gas under all pressures; G, spindle connecting valves with float, H H, guides to keep spindle exactly upright; I, syphon screw to let out condensation if necessary; K, float, which rises and falls in mercury with the varying gas pressures; L, loose thimble for carrying weights; M, regulating weights for modifying the action of the controller; N, brass cap, which is secured by padlock; N1, eyelet for padlock; O, inlet for mercury; O1, outlet for mercury in case of removal. When the gas enters the controller it passes first through the double inlet E E, and out through the double valve F F, and so under the float K, which, rising or falling according to the varying pressures from the main and the varying

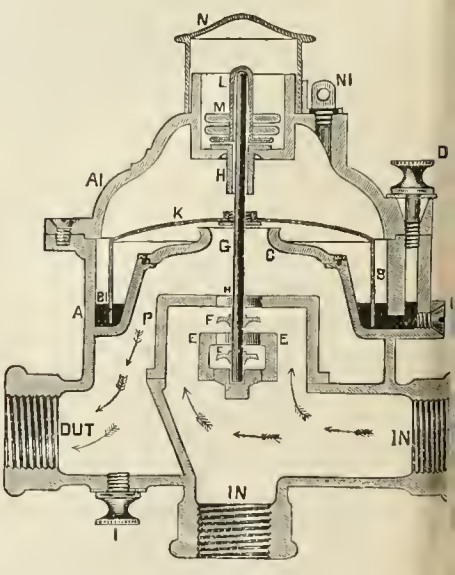


Fig. 2.—Sectional View of Controller.

consumption, opens or closes the valve. Several lead weights are supplied with each controller by means of which the defined force of the gas may be modified according to the permanent requirement. Thus if the delivery is found to be scarcely sufficient, a weight placed on the thimble L will increase the regu-

lar preasure. On the other hand, if the force is found to be too great, the removal of one of the weights will at once reduce it.

The pressure of gaa supplied to burnera should not exceed six-tenths; at this pressure it combines with the oxygen of the atmoaphere and causea a perfect combustion for illumination. The flaring or roaring flame is the only indication of waste to an ordinary obaerver, and when auch roaring occura the waate, it ia aaid, is from 50 to 60 per cent., and a waste aay of 30 per cent., it is claimed, would not be noticed, as there ia no perceptible noise to call attention.

The Brownhill Company publish a descriptive circular giving a number of very strong testimonials from uaers of their controller.

Meriden No. 27 Bracket.

The accompanying illustration shows Meriden Malleable Iron Company's new No. 27 bracket, with alab bar or metal apron. This bracket is intended for use in connection with alabs in place of the marble aprons heretofore commonly used. This combination, it is claimed, makes a much more artistic piece of work thau aprons of other kinds and, in addition, supports the front of the alab better than where brackets alone are used. These are made to conform to any size of alab, are furnished in brass and nickel, are light and artiatic in finiah and their atrength is guaranteed all that ia required to support any style of alab. Besides a variety of bracketa now ready, the Meriden Malleable Iron Company, Meriden, Conn., who manufacture the article illustrated, are preparing a line of novelties in aponge holders, soap dishes, towel racks, &c.

TRAPS AND VENTS.

Pelman Hague has opened a plumbing shop on West atreet, Pittsfield, Mass.

The store recently vacated by Fred. Disbrow, at Bridgeport, Conn., is now occupied by Spicer Brothera, who will carry on a general plumbing and tinning business.

A plumbing shop will be opened in Gates' block, Fenn atreet, Pittafield, Mass., by Wealey Noble.

John M. and H. C. Robertson have purchased the plumbing, gas and steam fitting business of Heisel & Co., at Stillwater, Minn.

The plumbing firm of Booth & Ballantyne, Montreal, Canada, have been registered as dissolved.

Plans were recently submitted to the Building Inspector for a four-story addition to the plumbing establishment of John D. Johnson & Co., on the west aide of Seventh street, below Race atreet, Philadelphia. The property next door to the preaent building was purchased recently by the firm and it is on this aite that the new structure is to be erected.

The John Schoen Plumbing Company were recently incorporated at St. Louis, Mo., with a capital atock of $10,000.

Portsmouth Machine Company, Portamouth, N. H., manufacturers of plumbers' brass supplies, castinga and Critchley's patent expanding reamer, issue a price list of rough brass fixings and aoldering nipples and unions.

E. W. Lang & Co., Portland, Maine, are manufacturing drop aolder for canners' use by an automatic machine, which turna out 25 pounds per minute. Any size from 32 drops to the ounce up can be made by regulating the gearing. They also manufacture atick and wire aolder and patent steel can cappers.

Zalmon Goodsell, the well-known master plumber, acted as toastmaster at the annual meeting and banquet of the Sons of the American Revolution, held last week at Bridgeport, Conn. It was an occasion of more than ordinary interest, and its success ia aaid to have been largely due to the labors of Mr. Goodsell.

Robert M. Vannan haa rented one of the atores in the new Odd Fellowa' Building on Salem avenue, Carbondale, Pa., and will remove hia plumbing business there.

A meeting of the Kennebec Master Plumbers' Association was held at the Elmwood. Waterville, Maine, recently, and G. F. Learned of Waterville, Maine, was elected vice-president.

Wm. A. Webber & Co., Beverly, Mass., plumbers, have dissolved partnership.

Case & Co., having bought a good portion of the late H. F. Spencer stock, have now located their plumbing and heating shop at 217 North Adama street, Green Bay, Wia., and are prepared to do all kinds of plumbing, gas fitting, ateam and hot water heating, also sewer work.

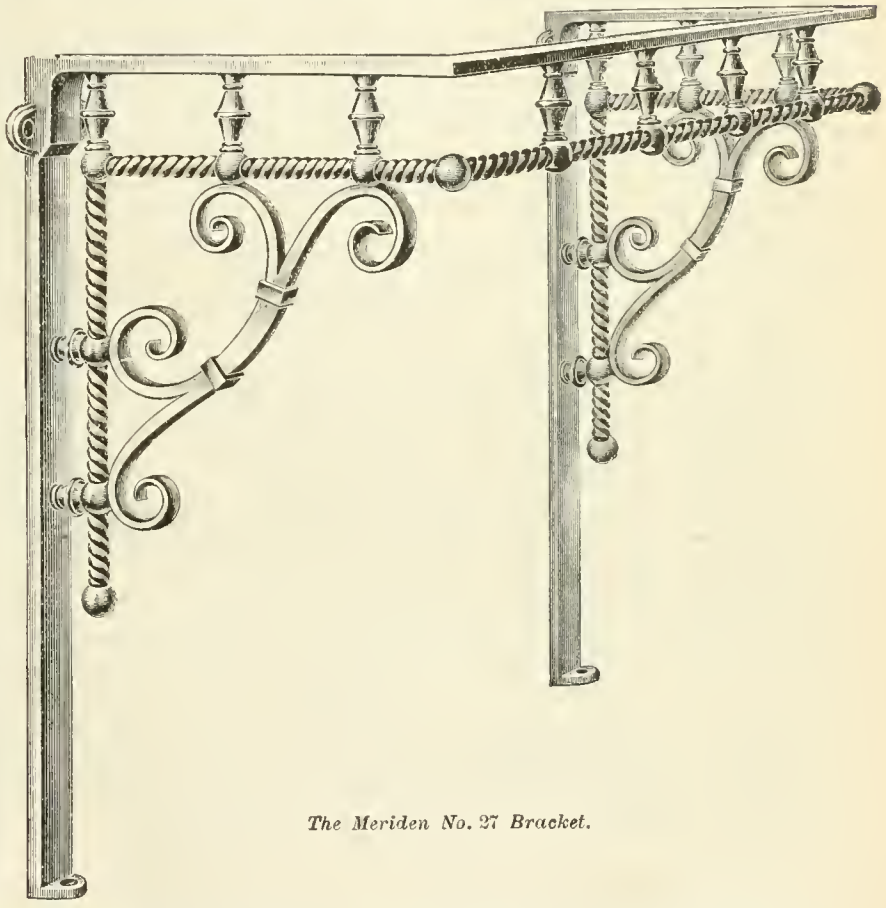
John O'Brien and Albert Rauf have opened a plumbing shop at 35 Hendricks atreet, Fort Wayne, Ind. The name of the firm will be O'Brien & Rauf.

Major L. N. Middlebrook, a Bridgeport, Conn., plumber and known at the national conventions as the "Old War Horse from Connecticut," made a telling response when Toastmaster Goodsell called on him to honor the memory of Gen. Gold Sellick Silliman, one of Connecticut'a Revolutionary heroes, at the banquet given by the Sons of the American Revolution.

John Shine and P. Love have gone into the plumbing business under the firm name of Shine & Love, and have leased the room opposite Jarman's drug store, Elm atreet, Trenton, Mo.

Ephrem Duford and Joseph Barrette have registered as partnera in the plumbing business at Montreal, Canada.

The Bradford, Pa., School Board, says the Oil City *Blizzard*, has condemned a school house on the ground that it "has no roof, no floor, very bad windows and no ventilation." In no way can persona more readily display their inconsiatency than by being unreasonably exacting. What do the claquers want? Here is a achool house with neither roof, floor nor windows, and yet complaint is made about the inadequacy of the ventilation. Only on the ground that the entire atmosphere of the place is contaminated can this be considered reasonable.



The Meriden No. 27 Bracket.

A new office created in Brooklyn is that of sanitary engineer and will be filled by William S. Johnson, B.S., of 471 Halaey street. Mr. Johnson will have charge of the plumbing bureau and will be expected to watch the dralnage of the city, the ventilation and drainage of houses and the sources the water aupply. Under Mr. Johnson's supervision new regulations as to plumbing, drainage and ventilation will be prepared.

We are indented to the Henry McShane Mfg. Company, Baltimore, Md., for a copy of the advance circular C of the bath and lavatory specialties of their manufacture. The volume, of over 50 pages, is 10½ x 8 inches in aize, neatly

bound in heavy paper. The goods shown begin with illustrations of lavatory legs in a variety of styles, brass brackets, then basin fixtures, bathtub fixtures, shower baths of various sorts, needle baths, &c., some 15 different styles of baths of this kind being illustrated. Bath and lavatory fixtures are noted. The Henry McShane Mfg. Com pany also publish a revised price-list of brass fittings, of which illustrations are shown in connection with tables of prices and sizes.

P. J. LYNCH, manager of the Dececo Company's Boston branch, is a candidate for the office of Sewer Commissioner for the town of Melrose, Mass.

ANDERSON & PAYMOND have recently opened a plumbing shop at 104 Charles street, Boston, Mass. They will also do coppersmithing and cornice work.

SABINE & HARVEY are about to remove from Boonville, N. Y., to 74 South street, Utica, N. Y., where they will be located after March 10. They inform us that they would like to have manufacturers send them their catalogues, prices and discounts on hardware, tinware, plumbing goods, &c., as they expect to engage in the tin and plumbing business in Utica.

THE PLUMBING AND STOVE STORE of Geo. Bradford, at Phenix, R. I., was destroyed by fire last Sunday night.

E. BAGGOT, 169–171 Adams street, Chicago, is to establish a branch house for the sale of gas and electric fixtures at 902 Olive street, St. Louis, Mo.

R. H. ELLITHORPE has bought the interest of W. H. Johnson of the firm of Ellithorpe & Johnson and will continue the plumbing business at 354 Niagara street, Niagara Falls, N. Y.

JAMES GRAY, plumbing inspector for the Board of Health of East Albany, N. Y., states that a set of plumbing regulations is being prepared for the approval of the local authorities. He has recently invented and is putting on the market an extension sink bracket, made to fit any size of sink from 14 x 20 to 20 x 40, which he will show by an aluminum sample at the master plumbers' convention at Buffalo, N. Y., March 6.

C. C. TODD, formerly with the Walcott-Hurlbut Company, has accepted the management of the Chicago branch of the Alberene Stone Company, 219 Dearborn street, manufacturers of laundry tubs, sinks, &c.

THE ST. LOUIS SANITARY COMPANY of St. Louis, Mo., are erecting in that city a sewage reduction plant with a capacity of 300 tons daily, and have satisfied the Board of Health that no offensive odors will arise from the work.

W. C. BODINE has purchased the store and plumbing business of C. K. and C. W. Larabee, Bellows Falls, N. H.

THE FIRST ANNUAL CONVENTION of the Association of Master Plumbers of the State of Michigan was held at Grand Rapids on February 27. At the first session 30 delegates were present. President James Meathe of Detroit called the meeting to order with an appropriate speech and the first day was given up to the report of officers and routine business and the evening devoted to the reading of papers of interest to the trade.

ARTICLES OF ASSOCIATION of the Michigan Heating & Plumbing Company were filed in the office of the county clerk at Jackson, Mich., last Monday. The capital stock is placed at $10,000, of which $4110 is actually paid in. The company consist of Julian S. Leet, Wm. H. Hamilton and Frank H. Close.

GEORGE CROW has leased ground on Union street on Central block lot, Bellaire, Ohio, and is putting up a building for a plumbing shop.

The Metal Worker acknowledges the receipt from the Master Plumbers' Association of Buffalo, N. Y., through Secretary Charles F. Menach, of an invitation to participate in the entertainment provided for the delegates to the State Convention of Master Plumbers. A theater party, a reception and smoker and a drive, on the different days of the convention, are the features.

The Chicago Master Plumbers.

The Chicago master plumbers held a meeting at their hall, 197 Madison street, Monday evening, February 26. In the absence of President Paul Redieske Vice-President Thos. Conway presided. A letter was read from President Redieske stating that his health had greatly improved since his visit to Hot Springs. J. Barrett, 54 Dearborn street, was made a member of the association. J. J. Wade presented a report of the Executive Committee's proceedings, stating that there was a loyal feeling among the plumbers throughout the country toward the National Association, and that new organizations were springing up, even in places where there were only a few plumbers. The Arbitration Committee reported progress in its work. Wm. T. Geary was appointed a committee of one to report on a plan of protection against professional dead beats, who run up a bill with one plumber and then patronize another. It is proposed to put a stop to this practice. There were many letters of regret received from members of the craft who were unable to attend the entertainment and ball recently given by the association. A vote of thanks was extended to the talented artists who assisted in making the entertainment a success. Through the courtesy of the secretaries of many plumbing organizations the Chicago association has been made acquainted with the wages and hours of labor of plumbers throughout the country. In this respect Pittsburgh is said to "take the cake."

Lawrence Shuster, Jr.

Lawrence Shuster, Jr., originator of the soil pipe and fittings business carried on under the name or style of the Shuster Foundry of Philadelphia, and South Pittsburg, Tenn., died on February 19 at his home in Philadelphia, of pneumonia. He was born in Philadelphia, April 6, 1852, and was educated at the Zane Grammar School, Filbert street, in that city. At the age of 17 he was apprenticed to the firm of Weaver & Pennock, plumbers, and stayed with them a year and a half, when he suffered from lead poisoning and went West for the benefit of his health. After six months' recuperation he returned to Philadelphia and associated himself with Hughes & Bros., plumbers, at Eighth and William streets, with whom he completed his apprenticeship. He then started in business for himself at 712 Callowhill street, where he remained 14 years, and until the Board of Health of the City of Philadelphia instituted a system of plumbing inspection, when he was appointed one of three inspectors under the system. This position he held about seven years, during which time he designed and introduced the Sure Seal specialties, now so widely known to the trade. The reception accorded these specialties proved so satisfactory that he decided to relinquish his position as inspector and devote himself to the manufacture and sale of the specialties. He accordingly opened an office and store at 717 Willow street, in Philadelphia, and did a good business. In 1892, becoming convinced that he had laid the foundation for a good business in sanitary fittings, he sought an opportunity for its development, and with Joseph Lodge, Wm. Lodge and his brother, Frank Shuster, formed a company under the name or style of the Shuster Foundry, for the manufacture of cast iron soil pipe and fittings of all kinds. Their buildings and plant were established at South Pittsburg, Tenn., in close proximity to the works of the Tennessee Coal & Iron Company, of which works Joseph Lodge was and is superintendent. The works were operated from the com-

LAWRENCE SHUSTER, JR.

mencement by Wm. Lodge as manager and Mr. Shuster looked after the trade in the East, using his place of business in Philadelphia as headquarters. The new concern soon acquired a reputation for the high quality of their goods and the variety of their fittings, and their business grew so rapidly that early in 1893 it became necessary to seek larger quarters for the Philadelphia establishment. Then it was that the property in which they are at present located was purchased. Mr. Shuster was a man of good ideas and executive ability, and he speedily adapted the premises to the requirements of the business. With larger premises an impetus was given the business and the results for the year were exceedingly satisfactory. All the pipe and fittings sold were guaranteed as to quality, and this fact helped not a little to swell their sales. The foundry at the present time is furnishing employment to over 100 hands.

Mr. Shuster was highly esteemed by the trade in Philadelphia and throughout the East. He was of a kind and cheerful disposition, and his manner was pleasing to all with whom he came in contact. During his inspectorship his decisions were conceded to be most fair, and met with hearty approval, and there were many who regretted his retirement from the public service. Although of generally robust health, his illness lasted but four days.

Press Working of Sheet Metals.—II.

BY OBERLIN SMITH.

Classification of Presses by Method of Support.

Another classification in commercial use is founded upon the fact that some presses stand upon the floor, either upon legs attached to the frame, as in Figs. 11 and 12, Chapter I, or with a base extending downward from the frame proper and resting upon the floor, as in Fig. 13, Chapter I, or in cases like Figs. 14, 21 and 22, Chapter I, where the bed is thick enough up and down to nearly or quite reach the floor, and does not need to be artificially raised up therefrom.

In contradistinction to these floor presses, whose peculiarity is usually not mentioned as such, are the bench presses, so-called, which are usually set with their bases resting upon an ordinary work bench, or in some cases upon one made lower than usual. The type of frame usually employed in such presses was shown in side and top views in Figs. 1 and 2, and in front and top views in Figs. 7 and 8, Chapter I. Drop presses, as in Fig. 22, Chapter I, are often used in this way also when they happen to be of small size. It is obvious that press frames can be mounted directly upon a bench in this way only when the depth of the bed is considerably less than the usually convenient hight for setting the top of the press bed above the floor, which is generally about 32 inches.

Obviously other classes analogous to these might be established, as, for instance, wall, ceiling and suspension presses. As a practical matter, however, the former two of these are rarely used. An instance of the latter is seen in the portable steam, pneumatic and hydraulic crabs which are used for punching and riveting, mostly upon boiler and ship work, and which are usually suspended from a trolley above and driven through the medium of a fluid conveying hose.

Classification by Kinetic Construction.

The next general method of classifying presses is by their kinetic construction, and they are often named after some important member of the driving mechanism, as for instance lever presses, screw presses, toggle presses, crank presses, &c. Before analyzing the kinematics of the subject more in detail (when, by the way, I will for convenience include drop presses, considering the center of the earth as pulling the ram down by an imaginary cord) it will be well to look for a moment at Fig. 1 and consider again the primal principle involved in all machines of this character. I have here shown the simplest possible form of press which would properly guide and strike together the two dies U and L, shown in dotted lines. It is, of course, but an amplification of the round stick

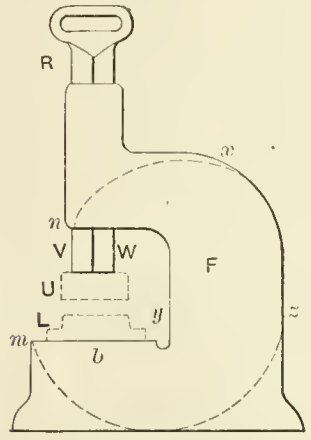


Fig. 1.

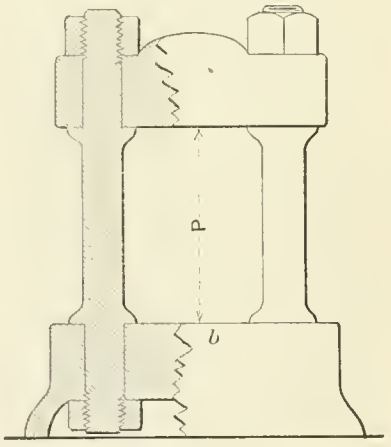

Fig. 14.

Fig. 16.

PRESS WORKING OF SHEET METALS.

of the primeval savage, slid by the pressure of one hand through the other hand closed around it as a guide, and pushed down over a hole in a flat stone, as imagined in the early part of the last chapter. In this case the ram R is shown of a rectangular cross section at *v w*, that it may not revolve and alter the relation of the dies to each other. It can obviously perform, within certain limits of pressure, all the functions of a press if the ram is simply pushed down by the hand of the operator. Indeed, such presses, with a spring added to lift the ram, are frequently seen upon office desks for embossing documents of various kinds. If it is worked upon a somewhat different principle, by the ram being lifted and allowed to do its work in falling, it then becomes a true drop press.

In Figs. 25 to 46 inclusive are shown a series of rams, R, with the press frames which guide them omitted, and with the various driving mechanisms crudely indicated by mere lines, which will, however, serve to show the principles involved. At F are shown the lever fulcrums which abut upwardly within some part of the frame structure. At *s* are shown the respective shaft bearings used in the case of power presses. These in Figs. 36, 37, 38 and 39 evidently also abut upwardly.

Describing these diagrams: Fig. 25 shows in side view section a hand lever press; Fig. 26, a foot pendulum press; Fig. 27, a foot lever press; Fig. 28, a hand lever toggle press; Fig. 29, a foot pendulum toggle press; Fig. 30, a foot lever toggle press; Fig. 31, a power crank lever press; Fig. 32, a power cam lever press; Fig. 33, a power crank lever toggle press; Fig. 34, a power cam lever toggle press; Fig. 35, a power toggle press; Fig. 36, a power crank press, ordinarily known simply as a power press; Fig. 37 is a front view of the same with the ram at down stroke; and Fig. 38 a front view of a power double crank (sometimes called a double pitman) press. These latter are often used for large work, where the ram needs to be very long from right to left, and would not very well maintain its parallelism with the bed were it driven down at one point only. In Fig. 39 is shown the ram of a double action press, driven down by cams working upon rollers, and a plunger, P, sliding inside of it, driven by a crank and pitman. Fig. 40 shows a hand screw press, with the nut *n* abutting upward in frame. Such presses are sometimes driven by power, also by means of any appropriate arrangement of reversible gearing connected with the screw. Fig. 41 shows a hand drop press, wherein muscular action stores up the energy developed by gravity rather than performs direct work, and in Fig. 42 is a foot drop press. In both of these cases the ram is lifted by a downward pull upon a cord or strap running over a sheave at *s*. In some cases such muscular action is assisted by a pulley at *s* being made to constantly revolve by power, the tightening of the cord giving nearly sufficient friction to raise the ram, which, however, falls and slides the cord over the pulley when no downward pull occurs at the other end. In Fig. 43 is shown a drop press with a roller lifter for the ram; and in Fig. 44 a crank lifter drop press. The rollers and crank are respectively driven by power, the rollers being separated when the ram is to drop, or, in the other case, the crank being thrown out of gear with its driving shaft. Fig. 45 shows a pneumatic, steam or hydraulic press, the ram being driven in one or both directions by a piston in cylinder *c*. In Fig. 46 is represented one form of a magnetic press, where the ram is actuated by a solenoid consisting of a bar of iron, *s*, which is drawn into a helix, *h*, or its equivalent, when a current of electricity is passed through the wires *w w'*.

Classification by Power Applied.

Press nomenclature enjoys another system of classification, which has, perhaps, been sufficiently indicated in the last paragraph, consisting of the kind of power applied. Thus we have various members of the family christened as hand presses, foot presses, power presses, hydraulic presses, &c. It is sometimes the case, however, that a foot press is supplied with a power attachment and that a power press is equipped so that it can be worked by hand, usually by fastening a crank to the fly wheel thereof. Again, a hydraulic or magnetic press is really a power press, because power, in the conventional sense of the term as derived from a revolving shaft, driven by steam or otherwise, has been used to force the water or electricity through the pipes or wires connected with the press. On the other hand, a hydraulic press might have its water supplied by a hand pump or even by a device supplied with a foot treadle.

Classification by Functions.

Still another classification is commonly used in the commercial baptism of the useful machine which we are considering, viz., that of functions. Thus we have the word press prefixed with the adjectives shearing, punching, cutting, forming, bending, embossing, coining, stamping, drawing, deepening or reducing, broaching, &c., almost *ad infinitum*.

Classification by Materials Worked.

Whether or not the classifications which we might elect to use are infinite in number it matters not; the fact remains that there seem to be an inconveniently great quantity. I will, however, mention but one more, which is derived from the material worked upon, thus giving us such names as tin presses, leather presses, soap presses, pill presses, brick presses, &c., the last three being, perhaps, distant cousins of the sheet metal press family, although much like them in many points of construction and in the employment of the general principle of compressing and embossing the material used, very much after the manner of an ordinary coining press.

From the above paragraphs it will be seen that when a sheet metal worker wishes to select a press from among the numerous kinds and sizes so freely advertised in the market, he will find them classified and named by their motions, their position, their shape of frame, their method of support, the kinetic principle of their driving mechanism, their mode of obtaining power, their functions and the material used in them. Furthermore, these distinctions are overlapped and interwoven with each other in every imaginable direction, as, for instance, when any one of a half dozen distinctly classified presses may with equal facility be sold him for a cutting press, or where all sorts of functions may be performed by a power press, &c. His only recourse is to have a general knowledge of the whole subject. This he must use judiciously, in connection with the advice furnished him by the press maker, so as to get a machine to suit him, regardless of what particular string of adjectives (as numerous, perhaps, as the Christian names of a Spanish duke) may be tacked on to the particular article which he will finally select.

Literature of Presses.

In commencing this treatise I had no intention of making it a natural history of the press family, although it has seemed necessary to treat all the different varieties somewhat in detail in order that subsequent descriptions of dies, together with the materials worked in them and the operations thereupon, may be clearly understood. Were it a thorough-going treatise upon the machines in question it might well of itself occupy a bulky volume, which should properly include a score or two of portraits in perspective of the various machines above referred to. There is, however, another reason besides lack of space for omitting such a set of pictures, viz., because it would be difficult to so limn them as not to make apparent some of the designs of well-known makers which are in the market, and thus lead to a suspicion of invidious distinctions, unless indeed it were possible to take composite photographs of all the good presses of each particular kind.

As far as the writer knows, the literature of this subject, outside of press makers' catalogues, is extremely limited. It is, however, to be hoped that in the not too far off future some competent author will give to the world a comprehensive biography of a family of machines which are far too useful to remain much longer in the realms of literary oblivion.

Such of my readers as are interested in analyzing more closely some of the various points involved in the mechanism of ordinary power presses, I will refer to a paper read by me before the American Society of Mechanical Engineers some years ago, entitled, "Power Press Problems," which will be found in Vol. IX, page 161 of their "Transactions." From this paper I quote a few paragraphs, as follows:

"To the maker and user of machine tools, which are often quite complicated in their construction and action, the machine commercially known as a 'power press,' may seem too simple to require any literature of its own. If the motions are analyzed which are required in the two general classes—machine tools and presses—it will be found in machines of the planer type, for instance, that it is necessary to move either the work or the cutting tool in an accurately straight line to a considerable distance against a cutting pressure, and in two other straight lines, both at right angles to this first line, and one of which has its direction adjustable to make an infinite number of angles with the other. For the necessary feeds and adjustments, these motions must be in both directions, and in the case of the first mentioned one the backward or return motion must be much faster than the forward motion.

"In machines of the lathe type, in which may be included screw machines, milling machines, boring and drilling machines, &c., there is frequently a similar set of motions to the last two described for the planer; while for the first named rectilinear movement is substituted a rotary one, so as to produce cylindrical and conical surfaces instead of planes. In both types of machines many of the motions must be reversible, intermittent and variable in speed. These requirements, together with all

the adjustments necessary, and the great strength and rigidity which ought to be, but are not always, embodied in such parts the writer has elsewhere advocated in writing of the 'anvil principle' *vs.* the 'fiddle principle' when criticising the extreme flimsiness of many of the machine tools in the American market. . . ."

A power press, "to a casual mechanical observer who had not studied it as a specialty, would seem to be far easier to design than the machine tools proper, mentioned above, but after taking it up as a specialty his judgment would be reversed, and he would find several knotty problems to keep him awake at

PRESS WORKING OF SHEET METALS.

night while the builder of lathes or planers was quietly sleeping the sleep of the just. This difference arises partly from the fact that power press building is both a newer and a smaller industry than the making of machine tools. It has not been so fully experimented with either in point of time or in regard to the number of experiments —in other words, these machines have not arrived at the same stage of development in the evolution of their race as have the older and more numerous tribe of lathes and planers.

"A more important difference, however, lies in the fact that machine tools are subjected to very little percussive action, while all the parts of a power press are constantly endeavoring to hammer themselves and each other to pieces. This is due chiefly to the fact that the work in the dies offers a sudden resistance to the moving parts when it is struck; and, incidentally, to the sudden stopping and starting of several heavy members of the machine while the wheel which drives them revolves at a constant speed.

"As a consequence of these conditions one of the problems arising is, how to fasten the parts together so that nothing will jar loose or come apart while in action. . . . ."

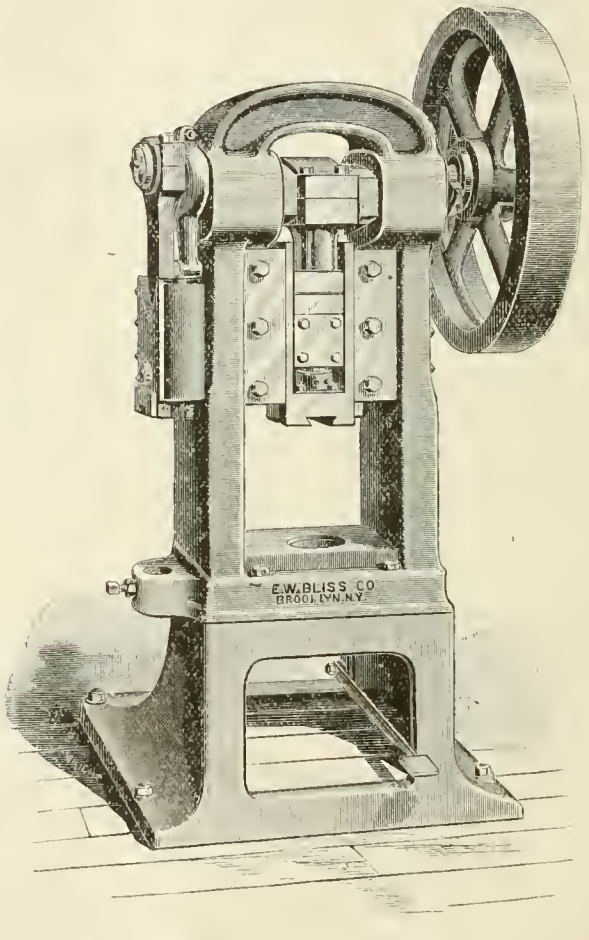
Advice to the Buyer.

In general, a few of the most important points to be considered by the purchaser of a press are as follows: 1. A great excess of strength and rigidity, that it may not break down or spring unduly from its normal shape. 2. Great length to the ram and ample surface of the proper shape upon its bearings and the parts of the frame which confine and guide it. 3. Accuracy of workmanship, especially in regard to the ram and its relations to the bed. 4. Durability, as secured by ample proportions in the smaller details and by sufficient bearing surfaces upon all the wearing parts, together with proper material, properly hardened where necessary. 5. All the clumsiness possible in the bed, ram and parts adjacent thereto, to give plenty of the anvil principle; that is to say, plenty of inertia to resist sudden blows without undue vibration. 6. Convenience of manipulation both in operation and adjustment. 7. Ample length of adjustment in the ram and other members having variable positions, together with plenty of die room in general. 8. Beauty and harmony of general design. This latter point may be sneered at as of no practical consequence by some non-esthetic Philistines whose souls are but part way civilized. Such men, however, must sometimes buy presses. For their financial benefit I will say that, in the long run, those machines which are the most artistically proportioned will, necessarily, have their materials so located in detail as to do the most good for the least money. They will, therefore, be the strongest and most durable.

It is calculated by the Mint Bureau officials that the gold production of the United States for 1893 will reach a total of $37,000,000 in value, as against $33,000,000 for 1892. Colorado alone contributes an increase of from $3,000,000 to $4,000,000, Montana, Arizona and New Mexico also showing gains. These figures bring up last year's gold production in this country to a point exceeding that of the bonanza period. The world's total gold production in 1893 is estimated to be more than $150,000,000, a gain of at least $12,000,000. These figures, in view of the fact that the output of silver last year was the smallest for many years, are reassuring as evidence that the gold supply will be entirely adequate for monetary purposes for some years to come.

Trimming Press for Drop Forgings.

The engraving represents a press of new design built by the E. W. Bliss Company of 17 Adams street, Brooklyn, and is intended for use in the forge shops where hot metal is to be trimmed. It is provided with the Bliss clutch and a patented adjustment in the slide, and has a supplementary slide in the side of its frame to be used in cutting off the work from the bar after it has been forged and trimmed. The press is of ample strength in all its parts and is usually provided with a fly wheel, as it is generally necessary to trim forgings very quickly and a high speed machine is essential. The machine shown has a 4-inch stroke, 4-inch adjustment; bed is 15 inches from bed to end of slide when up; distance between uprights is 22 inches. This machine carries a 900-pound fly wheel, the total weight being about 5500 pounds. The dimensions can be modified to suit special requirements if necessary. These presses can also be geared for cold trimming.



TRIMMING PRESS FOR DROP FORGINGS.

An important canal project, caculated to revolutionize lake traffic, is said to have the support of a number of New York, Chicago, Boston and London capitalists. The plan is to construct a canal, capable of accommodating the heaviest vessels, directly across the State of Michigan from the eastern shore of Lake Michigan either to Detroit or Toledo. Preliminary surveys of these routes have been made and the scheme pronounced by eminent engineers to be perfectly feasible. Either canal would be about 180 miles long, and would greatly facilitate the passage to the East of vessels from Chicago, Milwaukee and other Northwestern points, rendering unnecessary the present long water route through the Straits of Mackinaw, Lake Huron, St. Clair River and Lake, and down the Detroit River to Lake Erie.

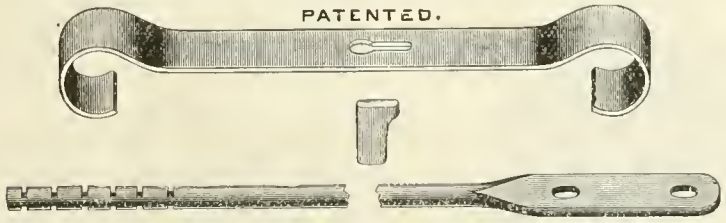
Statements received at the Department of Internal Affairs at Harrisburg, Pa., showed that the railroads in the State carried much more freight in 1893 than in 1892. The tonnage from the mining districts increased from 171,913,484 tons to 180,534,176; products of forests from 15,853,793 to 16,602,476; manufactures from 35,528,399 to 40,147,802; merchandise from 20,862,902 to 25,911,492. The tonnage of agricultural products decreased from 19,174,726 tons to 18,477,085. In 1892 the aggregate tonnage was 263,333,304 tons, and in 1893 281,673,031.

The first practical system of towing canal boats by electricity has just been inaugurated on the Bourgogne canal, says the New York *Marine Journal*, connecting the Seine and Saone rivers, France. The power is furnished by water falling from sluices at the two ends of the canal, and the current is made steady by means of storage batteries. The trolley system is used.

ROOFING AND CORNICE.

The Mundwiler Eave Trough Hanger.

We show in the accompanying illustrations the Mundwiler patent steel eave trough hanger made by Rhodes, Dickelman & Co., Forest, Ohio. Fig. 1 shows the different parts of the hanger. The rod after being bent is passed through the hanger and held in



The Mundwiler Eave Trough Hanger.—Fig. 1.—Parts of Hanger.

place by the key shown in the engraving, the slots at the end of the rod permitting adjustment to any fall or pitch. It will be seen by this arrangement that the trough is easily removed, as the key can be released without difficulty, and it can be taken down and painted without removing the hanger from the roof. Fig. 2 shows the Mundwiler patent clamp and slot hanger. The rod and hanger are fastened together by means of a key as in the case just described. The special feature of

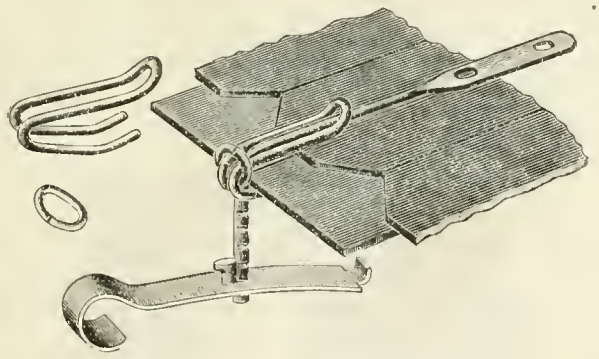


Fig. 2.—Hanger for Slate Roof.

this, however, is the device shown at the left, by means of which the hangers can be fastened to a slate roof without the use of nails, screws or burrs. The construction and application of this device is shown in the illustration.

Allen's Corrugating and Cornice Works.

An establishment which has grown remarkably within the past few years is Allen's Corrugating and Cornice Works, of which Thomas Allen is proprietor, at 422 and 424 West Randolph street, Chicago. The growth in the business compelled the addition of power some time since, and Mr. Allen is now enabled to turn out all classes of heavy work, such as are not easily attempted by those who operate hand machines. The shop is 180 x 50 feet, one story high in front and two stories in the rear, being very light and well arranged for receiving and shipping. It is well fitted with all appliances of the most approved character for corrugated and galvanized work.

The machinery comprises power shears for light or heavy sheets, geared and simple brakes, a very powerful crimper, a toggle machine for making standing seam roofing, skylight bars, V-crimped roofing, beaded ceiling, &c.; large corrugating rolls, weighing 12 tons; curving rolls, for curving arches of corrugated iron, &c.; power press for cutting skylight miters, cleats for roofing, &c.; power punch and shear for round, square and flat iron; machine for making curved moldings. The crimper above referred to is an exceptional machine, doing remarkably fine work. It takes a sheet 52 inches wide, and when turned out the sheet is as level as the top of a table, totally free from buckles or waves. The curved molding machine is one of the finest in the works. It makes curved moldings or cornices of any size, strictly true to profile and radius. The dies are very nicely adjusted, and the machine is controlled by a treadle, which regulates the stroke to the exact power desired. A brick machine is shortly to be installed for making steel brick in sheets 30½ x 60 inches, which is much larger than the capacity of most machines of the kind, thus reducing the amount of labor in putting the brick in place and making fewer joints when complete. Ample facilities are enjoyed for painting iron, while the storeroom will hold 500 to 800 tons of stock.

The second story of the rear portion is used as a warehouse, and forms a convenient location for paint agitators, &c., for the painting department below. In the front part of the shop is a good drafting room, well fitted up for laying out work, cutting patterns, &c. These works were equipped specially for making galvanized iron and copper bay windows, cornice work of all kinds, corrugated iron partitions, &c. This has been seriously interfered with by the action of the Chicago City Council, forbidding the use of galvanized iron work with wooden backing, and establishments of this character have thus been compelled to pay greater attention to other lines. The Allen Works will in the near future add a department for the manufacture of galvanized iron conductor pipe, gutters, &c. They will then cover all kinds of work in roofing, siding and finishing. Their facilities will enable them to handle the largest contracts. They do not limit themselves to local trade. Their business already covers a broad expanse of territory, but is principally in the West and Northwest.

They have just issued an illustrated catalogue of a number of their specialties. It is a neat publication of 16 pages, containing a great deal of interesting matter for roofers and cornice workers.

FLASHINGS.

Rhodes, Dickelman & Co., Forest, Ohio, have just put in their works a line of the latest and most improved machinery, and have at present a capacity for turning out 5000 feet of eave trough per day, though, they say, the facilities can be increased to 10,000 feet per day, if the trade demands. We hear from the firm that their prospects are very favorable, as a number of jobbers have become interested in their specialties. In addition to their eave trough hangers and roofings, sidings, corrugated iron, &c., they furnish galvanized conductor, elbows and other articles of galvanized iron.

David Lupton's Sons, 2611-2613 Coral street, Philadelphia, have recently added some new machinery to the cornice and skylight plant. They are now turning out hanging gutter, ridge roll and angle coping in 10-foot lengths. They are furnishing the Esterbrook Steel Pen Company with a sheet metal *fac simile* of their falcon pen for advertising purposes that is 3 feet long.

Some of the Pennsylvania slate quarries, which have been idle all the winter, are announced as about to resume work.

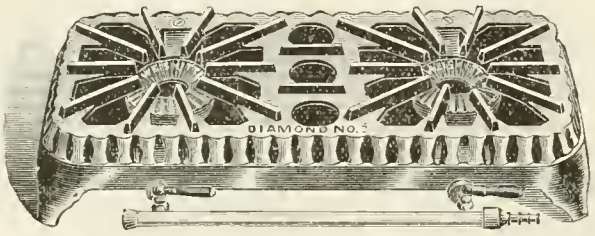
The large plant of the Porter Iron Roofing & Corrugating Company, which has been located at 101 West Front street, Cincinnati, is to be removed to Anderson, Ind. The final papers were signed on February 11 by the officers of the company and the officials of Anderson, in consideration of a small bonus and a factory site. Operations at Anderson by the iron works are to be commenced by May 1. The concern give employment to a large number of men

The American Roofing Company, St. Louis and Cincinnati, report a fair trade for the season. Their spring business will doubtless be large, as inquiries received by them denote that jobbers are not overburdened with stock and will shortly have to replenish. The Southern trade, which usually opens up about the middle of February, is a trifle backward, but promises to be heavy.

THE RETAIL STORE.

New Table Gas Stoves.

A. Weiskittel & Son, Baltimore, Md., have just brought out two new lines of gas stoves, each provided with two burners in the top plate. The larger size, offered under the name Fire King, is referred to by the manufacturers as of superior construction and possessing among other features a large flush top,



New Table Gas Stoves.—Fig. 1.—General View of Diamond Stove.

removable rings, air regulators, lever cocks and loose top burners, making a stove which, it is said, cannot get out of order and which enables the operator to readily keep it clean. The ornamentation is neat, nickel plate being judiciously employed, while the feet and edges of the top are highly polished. The feet are referred to as being especially attractive and ornamented with rich raised carving. The

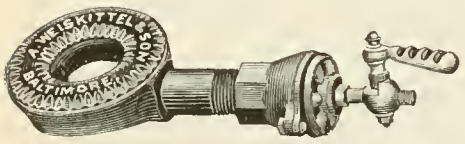


Fig. 2.—General View of Burner Employed.

second line, which is offered under the name Diamond, has been brought out to meet the demand for a low priced gas stove. It is, however, beautifully finished in nickel plate, and the manufacturers make for it very strong claims. We present in Fig. 1 a general view of this construction. The loose top burner, Fig. 2, which is employed in connection with these goods, is made entirely of

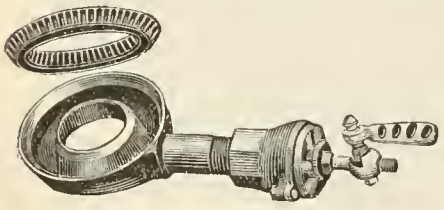

Fig. 3.—View of Burner with Loose Top Removed.

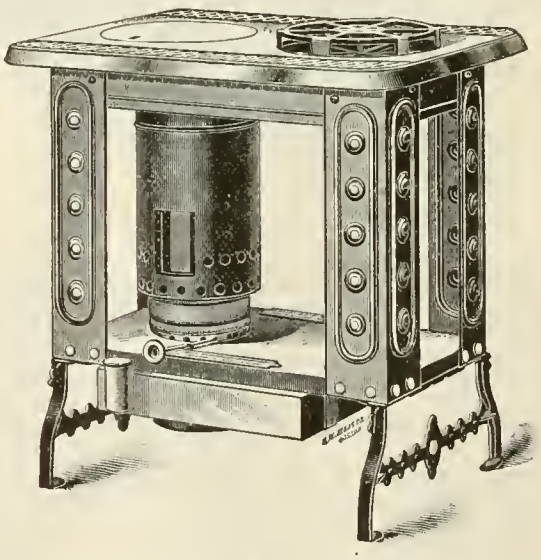
heavy cast iron, rendering it strong and durable. The makers state that it cannot get out of order, as there is nothing about it to burn or break, while it can readily be kept clean by simply lifting off the top, as indicated in Fig. 3 of the engravings, and removing any dirt which may have accumulated in the burner. The construction is such that any one can operate the stove, and all will readily appreciate the advantages claimed for the burner. The manufacturers point out that a perfectly clean burner will generate, with the same consumption of gas, a greater amount of heat than one clogged with dirt. The firm are now manufacturing five different lines of nickel plated gas cook stoves, for which many claims are put forth. The new catalogue which the firm have in preparation will be mailed to the trade in a short time.

Improved Ladies' Delight Oil Cooking Range.

Page Brothers & Co., successors to William Page & Co., Nos. 227-233 Cambridge street, Boston, Mass., have just brought out what they designate as the latest improved Ladies' Delight Cooker, embodying features of construction likely to interest the trade. The illustration which we present herewith represents one of the two sizes in which the range is offered, the other being double the capacity and provided with two burners. The feature to which special attention is directed consists of the manufacturers' patent central draft burner, made of seamless brass tubing and having a metallic covered non-conductor between the burner and tank, which prevents the latter from becoming heated by radiation. The tank holds 1 gallon and is made of polished brass, as are all those portions of the stove coming in contact with the oil. The stove here shown has two holes in the top, the latter measuring 16 x 20 inches. The oven occupies one griddle hole, while the other, which is directly over the flame, is available for other cooking purposes. The manufacturers refer to this stove as absolutely safe and odorless, neat, clean and easily cared for and does not smoke or draw up.



Improved Ladies' Delight Oil Cooking Range.

MEMORANDA.

A. B. SCHOONMAKER, who has been with the firm of E. F. Berean & Co. for about five years, has purchased the tin and stove business of W. H. Newman, at Marlborough, N. Y., and will hereafter conduct that business himself.

W. C. VANDENBERGH & Co., Blue Island, Ill., have just opened a large hardware and stove store in that place, putting in a complete line of Peninsular goods, which they have arranged to handle exclusively.

W. B. HIRST is about to open a stove and tin store at South Charleston, Ohio, where he will also be prepared to do all kinds of roofing. Mr. Hirst will be glad to receive catalogues from manufacturers in his line.

Final action has been taken by the trustees of the Brooklyn Bridge in relation to the terminal improvements in Brooklyn. The plan for extending the bridge terminal to Tillary street and the erection of a station at that point, involving an expenditure of from $3,000,000 to $4,000,000, was abandoned, and the plans prepared by the bridge engineers a year ago accepted. The total cost will not be more than $300,000. It is probable that the cars on the bridge will be lighted with Pintsch gas, recent experiments with that system having proved satisfactory.

STOVE TRADE NOTES.

The New York City Stove Trade.

The stove trade in New York City and nearby towns, considered as a whole, may be set down as dull, with a slight improvement in February over what it was in January. The present demand for coal cooking stoves of the portable variety is and has been so small that orders for such stoves do not resemble the usual forerunners at this time of the year of an approaching spring trade. There is nothing in the demand to base any hopes of a satisfactory spring trade on, so far as those particular stoves are concerned, and it is still so small as to imply more the need here and there of a stove to replace one that has actually broken down and fallen to pieces beyond the possibility of repair. There is not enough in it to afford an analysis, based on sizes, varieties, quantities and grade, and compute its probable growth and character, or to indicate that the people are disposed or able to buy for any other reason than actual need.

If the people are too poor or too afraid to buy until practically driven to do so for the want of something to build a fire in, it is plain that the stove business, which for its profitable magnitude depends so largely upon purchases made in deference to fashion, pride, or the desire for greater conveniences, will continue to be restricted until confidence is restored to promote buying by those who have the means, and money is let out in other avenues to furnish employment to idle men. In this connection, and as affecting to a considerable extent the city trade, much depends on the building business hereabouts. In this line some improvement is observed, and it affords the only ray of hope of spring business, not only in the cooking and heating apparatus used in new buildings, but in portable stoves as well, and those concerns who manufacture or deal in both classes of goods will be benefited to a double extent. The severe weather during the past month has hindered progress in this line, and postponed the benefit to the stove business that always arises from building activity. Every mild day has brought inquirers from among the builders or agents of mortgagees, into whose hands much unfinished property has recently been and continues to be turned back, as to plumbing, hardware, roofing, ranges and heaters, only to be nipped in the bud by extreme cold weather or snow following. Signs of strong activity even in this line are absent, as loans are still made with a sparing hand, credit for material is only conservatively extended, rapid transit is still unsettled, and affairs at Washington uncertain, so that the stove business from any point of view seems not to be destined soon for a recovery from the depression into which the whole trade and commerce of the country have settled.

While all this is true as based upon present signs there may be more business in March than any of us dream of at present or that there seems any reason to expect. Traveling salesmen are just about leaving town, two weeks late, as a rule, and their sales and reports after getting fairly to work may contain more encouragement than is looked for. Certain it is that much money is withheld from circulation by those who can well afford to spend it, and those who have had continuous employment ever since the cry of hard times was first heard have saved every cent they could for fear of losing employment, and these people must get "tired out."

Man is not prone to long indulge gloomy forebodings or to long continue the practice of self denial. Again, the winter, which everybody has dreaded, is nearly ended; the crisis is past and the hopeful season of the year is at hand, when it may reasonably be expected that many who got through better than they anticipated and saved money besides will make purchases long delayed and help to swell the amount of money in circulation and create a vacuum in the market, which factories, foundries and mills will quickly respond to fill. SIFTER.

An Ideal Gas Stove.

In a recent number of the *Gentleman's Magazine* Lynn Cyril D'Oyle publishes an article on the use of gas for cooking and heating, in which he discusses at some length the report of the *Lancet* Commission which was reprinted in *The Metal Worker*, December 23 and 30, 1893. From Mr. D'Oyle's article we quote the following account of an ideal gas stove:

I would have gas fires specially constructed upon what is my ideal of perfection. The stove would be supplied with air sufficient to insure the complete combustion of the gas consumed from outside the apartment, either through the floor or from an outer wall —not to avoid the cock and bull theory about burning up the oxygen, but so that any draft along the floor would be impossible, and to insure all the ventilation being from the top of the apartment. I would have the air and the gas supply so contrived that both were heated to a very high temperature before coming to the point of ignition—of different construction, but on exactly the same principle as the recuperation lamp—a system by which the best heating effect is to be obtained, and one which seems to have been neglected by stove makers. Would not this also insure a noiseless burner? My fire should be atmospheric, and packed with clay balls to give a cheerful glow and to impart as much radiant heat as possible. The flue should be from the top of the stove, of sufficient size only to carry off the products of combustion, and going straight up to the ceiling, where it would run between it and the floor above, and join into the flue coming from the ventilating light. It would then draw the vitiated air of the apartment away through the rose over the ventilating light, and, in fact, would do exactly the same duty. By this means practically the whole heating power of the gas consumed would be utilized upon the air of the room, and we should combine the three greatest things to be attained—the full calorific value of the fuel, a hot, glowing, cheerful fire, and a most excellent system of ventilation, which might add a span to life and be a material aid to comfort. The flue from the stove to the ceiling might be covered with art porcelain or other ware, so that it would be really attractive. But in any house not specially constructed such a contrivance would probably be more efficient than any other method, and when not convenient (or considered too expensive) to put in a shaft, the flue could be carried up nearly to the ceiling line and then through into the chimney, having a ventilating rose around it. The damper at the bottom of the chimney would, of course, be closed. The only disadvantage to this would be that in time the ceiling would be discolored above the bend, not from any products of the gas, but for the same reason which causes a similar effect over any steam or hot water pipe.

Cooking and Heating by Electricity.

Central Electrical Heating Co., Havemeyer Building, 26-28 Cortlandt street, New York, manufacturers among other things of a large number of articles for culinary, laundry and heating purposes by means of electricity, have fitted up a room adjoining their suite of offices as a kitchen and dining room. This is in charge of a competent cook, who prepares every day a meal for the office staff and such as are desirous of seeing a practical demonstration of this method of preparing food or heating rooms. The implements made by this company are so arranged that to operate them it is only necessary to connect with any electric light wires in any room in a house. There is no danger from shock, the current admitted to houses being insufficient to do harm. Among other things the company manufacture Ranges with one or more ovens, suitable for roasting, baking, &c., Broilers, Toasters, Coffee and Tea Pots, Stew and Frying Pans, Tea Kettles, Laundry, Hat and Curling Irons, Glue Pots, Chafing Dishes, &c. For ordinary purposes, aside from space heating, it is stated this method competes successfully with coal at $6 per ton. Unless water power is available, the entire heating of buildings, &c., at the present rates for supplying electricity is still a luxury. There are, however, residences in this city and Brooklyn where no coal has been used for two years for cooking, heating, lighting and laundry purposes. One point emphasized is that there is no dirt from coal or ashes, the current can be turned on or off instantly and the intensity of heat graded by simply turning a switch. In warm weather the heat can be discontinued when through with, while in cold weather a heating apparatus can be quickly connected in any room wired for electric lighting, for the purpose of supplementing the supply of heat, as in a nursery, dining room, library, sick room or wherever

needed. This method does not vitiate the air of the room by absorbing the oxygen in it, as when gas, oil or coal are used. They also make Disk Stoves for light work, to be used anywhere. These are a few inches high and about 12 inches in diameter. When the utensils or heating apparatus are not in use the expense is stopped by cutting off the current, meters measuring what is used, the same as gas. This company have recently fitted over 2000 railroad cars with their heating apparatus, 200 of which belonged to the Atlantic avenue trolley system in Brooklyn.

ODD PLATES.

The Cincinnati Steel Range Company of Cincinnati, Ohio, have just brought out a new line of low priced wrought steel ranges designed for family use. Two sizes and three styles are now made. The goods are designed, we understand, to meet the demand for a first-class family size wrought steel range, approximating in cost the ordinary cast iron construction. The new line is well proportioned, massive in design and tastefully decorated with nickel. The arrangement of parts is such that coal or wood may be used in the same fire box. The manufacturers are confident that the new line of goods will meet with favor at the hands of the trade.

The pattern storehouse of Hess, Snyder & Co., Massillon, Ohio, was seriously damaged by fire on Tuesday, February 20. The conflagration is thought to have been the work of an incendiary, and resulted in a loss which at latest advices was estimated at $5000, partially covered by insurance.

C. W. Trotter & Son, 46-48 North Clinton street, Rochester, N. Y., send us a neat catalogue, with folders, relative to the bake ovens which they manufacture. These goods, we understand, are intended to take the place of a brick oven, being provided with three walls, outside, inside and middle partition, and are lined with asbestos or mineral wool, which, with an air space, makes five thicknesses. The ovens are made single and double and are intended for using coal or wood as a fuel. The manufacturers make special reference to their mechanical construction, durability, cleanliness and insulation of the walls. The Trotter galvanized steel bake oven is designed for bread, meats, pastry, &c., and for use in bakeries, hotels, asylums, colleges and all public institutions. They also refer to their patent dry air refrigerator and to the fact that cold storage rooms and refrigerators are constructed to order. The firm handle as specialties furnaces, ranges, gas stoves, refrigerators, bake ovens for public institutions and hotel supplies.

According to recent issues of local papers the State Department, at Harrisburgh, issued on Monday, February 19 a charter to the Chicago & Erie Stove Company of Erie, Pa., capitalized at $200,000. The directors named are William H. Whitehead, Charles E. Shirk and Frank C. Whitehead.

The Weir Stove Company of Taunton, Mass., closed their works on the night of Thursday, February 15. The policy of the company in the past has been to run their shop, when in operation, full capacity, and as they were getting on hand more goods than appeared necessary in view of the depression in the trade, they shut down without naming any time for resuming. They hope, however, that the shut down will be for a short period only, depending largely upon the condition of trade in the immediate future. They expect, however, that early in the month things will be in shape to put their men to work in all departments.

The Schneider & Trenkamp Company of Cleveland, Ohio, have issued an exceedingly attractive catalogue and price-list relating to their lines of gas stoves made under the name Reliable. It is a well arranged pamphlet of 70 pages, neatly printed on a good quality of paper and bound in colored paper covers carrying a side title in old gold. The engravings are well executed, and show to advantage the various styles and sizes in which the Reliable goods are made. This volume is the fifth annual gas range catalogue which the company have brought out, and in it the statement is made that the manufacturers are offering seven distinct lines of ranges "which are unquestionably leaders in the gas stove world today." Among the improvements which the company have made for the coming season may be mentioned the addition of an entire line of ranges with side broilers and a complete line with half low water heaters. In response to a call which they have received from various sources during the past season, they have also added an entirely new line of cheap ranges. The opening pages of the catalogue are given up to a number of testimonials from those who have used the company's goods, following which the Reliable gas ranges are illustrated and described. The goods are well made throughout, embodying the latest features of convenience and utility, and are ornamented in a manner pleasing to the eye. Attention is also given to Reliable junior gas stoves, or hot plates, burners, furnaces, sad iron heaters, broilers and toasters, stew pans, gas radiators and bake ovens. A telegraphic code is presented for the use of dealers desiring to order goods by wire.

A sign in front of the building now occupied by the Thatcher Furnace Company, New York, gives notice that they will move to 240 Water street about May 1.

Eugene Belson, at the recent expiration of the partnership of Faith, Belson & Co., stove dealers, at Philadelphia, withdrew from the firm.

F. M. Borden & Bro., Philadelphia, welcomed F. M. Borden home from a sojourn in Florida last week, and after a very rough sea voyage stoves and refrigerators were a very welcome sight. He says that no section has been so thoroughly drummed recently as Florida, as a result of the "fight or fizzle" which came off at Jacksonville.

L. B. Cress is on a trip through Pennsylvania representing the Leibrandt & McDowell Stove Company of Philadelphia, and disposing of Farmer Girl cooks and the Victor Cook ranges.

Reeves & Horner, 45 North Second street, Philadelphia, Pa., are issuing a trade price-list of their Globe oven for oil, gas and gasoline stoves. The doors are stamped with designs from dies in their presses and the ovens have a double stayed corner and some have a Russia iron top. The ovens are finished on the inside with soft steel and are said to be superior bakers. With this circular they send a list of the stove sundries they handle and a list of the manufacturers whose repairs they carry in stock. They have the sales agency for Philadelphia of March-Brownback Stove Company of Pottstown, Pa., Schuylkill Valley Stove Company of Spring City, Pa., Raymond & Campbell Mfg. Company, Middletown, Pa., and have recently been made the Eastern sales agency and distributing house of the gas goods of Geo. M. Clark & Co., Chicago, Ill.

The Front Rank Steel Furnace Company of St. Louis, Mo., report a good demand for their Front Rank steel furnace. Four furnaces have recently been shipped to Stratford, Ontario, and a number of others to various points in Canada. The makers are experimenting with a hot water heater, which will shortly be ready for the trade, and which promises to create a sensation, as regards economy and heating capacity.

The Stockhoff Heating Supplies Company, St. Louis, Mo., are issuing a batch of advertising matter to the trade, consisting of vest pocket memorandum book, circulars, &c. This advertising matter refers to the fact that they are agents for the Bostwick steel lath and also for the product of the Barbee Wire & Iron Company.

The thirty-fourth meeting of the Foundrymen's Association will be held at the Manufacturers' Club in Philadelphia on Wednesday, March 7, at 8 o'clock p. m. There will be a discussion on W. J. Keep's paper entitled "Foundry Chemistry," as to whether chemistry or the ordinary practice used by foundrymen in mixing their irons, &c, can better be depended upon for foundry practice. A number of analytical chemists are expected to be present at the meeting to take part in the discussion.

The annual meeting of the stockholders of the Chattanooga Stove Company, Chattanooga, Tenn., was held Wednesday, February 14 the old Board of Directors being elected, as follows: W. W. Baldwin, H. J. Baldwin and M. B. Clark of Cleveland, Ohio; C. H. Baldwin of St. Louis, and G. W. Farrington of Chattanooga. The report of the condition of the company by Manager G. W. Farrington was regarded as very satisfactory, the company having enjoyed a fairly prosperous year. The works are reported in full operation and giving employment to nearly 100 men.

The stove plant of the Abram Cox Stove Company, situated at Lansdale, Pa., resumed operation on February 23 with a force of 100 men.

John A. Duncan, receiver of the stove works of Duncan & Masters, Eighth and Santa Fé streets, Kansas City, Mo., has recently filed his report with Judge Henry. The statement shows that he has received in cash $9917.04 and disbursed $9137.73, including a dividend of 40 per cent. paid to creditors.

The Scranton Stove Works announce under recent date that owing to the growing importance of their Western business they have arranged with Judson A. Tolman to give up his retail trade in Chicago and devote his entire time to the wholesale business. The company state that by reason of a well equipped modern stove plant erected in 1893 and with an increased stock in Chicago they will be able to promptly supply the wants of their Western customers with "a line of stoves and ranges second to none." Mr. Tolman's headquarters in Chicago are at 32 Van Buren street.

P. C. DeVol, Council Bluffs, Iowa, offered a prize for the best poem on Garland stoves and ranges. The successful verses describe very cleverly many of the merits of these well-known goods. The conclusion of the story is as follows·

So, now, all you people who want a good stove,
Stay right here at home and no longer rove;
For the stove that is known as the best stove of all
Is the "Garland," sold only by P. C. DeVol.

The Glazier Stove Company, Chelsea, Mich., issue a notice to the trade, under date of February 19, that their warehouse and offices were completely destroyed by fire on February 18. They state, however, that this will interfere with them but slightly in supplying their customers with the B. & B. stoves, as their factory and unfinished product are unharmed. They are running full force and turning out goods at a rate that will soon enable them to fill all orders promptly.

J. B. Oldershaw of Baltimore, Md., has issued under date of March 1 a notice to the effect that the stove and furnace business established in that city by him in the year 1859, and continued for the past 35 years, will hereafter be conducted under the name of the Rapid Transit Stove & Furnace Company, located at 628 North Eutaw street and 400 and 402 Druid Hill avenue.

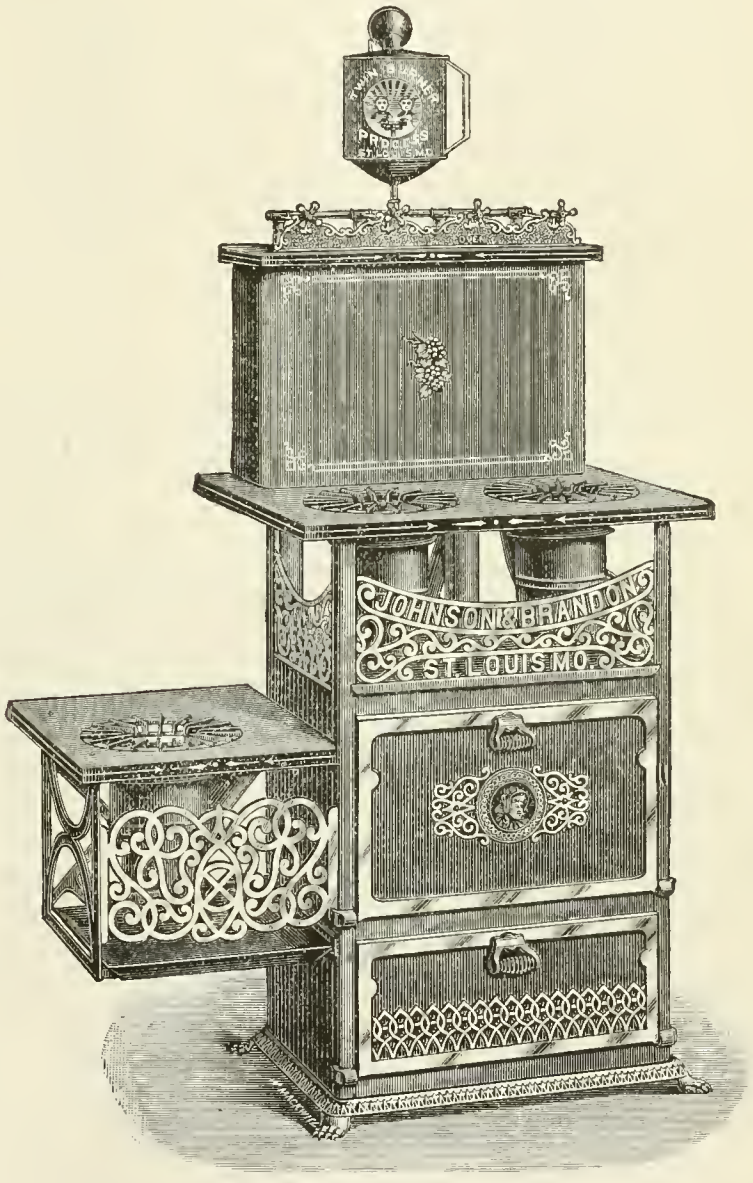
"Monarch Gas Stoves," is the title of a very neat catalogue of over 30 pages, which reaches us from the Baxter Stove Company of Mansfield, Ohio. The printing is upon tinted paper, the text appearing in two colors, while the engravings are in black. The binding is in colored covers, and the side title is embossed in old gold letters. The frontispiece consists of a bird's-eye view of the company's works at Mansfield, facing which is a group of portraits consisting of Thomas Baxter and his seven sons. The goods illustrated are made under the generic name Monarch, and comprise numerous styles and sizes. The goods embody the latest improvements and are constructed in a manner giving good results in operation. One feature of the Royal Monarch stove to which particular attention is invited is an iron casing added to the end step, within which is a portable reservoir made of cast iron and either porcelain lined or lined with 14 ounce tinned copper. Attention is also invited to the Monarch, which is offered in Nos. 84, 94, 5 and 44. Under the same name is offered a line of table stoves consisting of Nos. 4, 42 and 43, while Nos. 53, 55 and 58 are hot plates. The closing pages of the catalogue are devoted to the Monarch gas heater, Monarch broiler, steam cooker, ovens and fittings.

The office and salesroom of the Richardson & Boynton Company, 84 Lake street, Chicago, has been moved to the second story of the same building.

Press dispatches from Bloomington, Ill., under date of February 25, are to the effect that early on the morning of the day named fire broke out in the works of the Bloomington Stove Company in that place, entailing a loss of several thousand dollars. The works were practically destroyed, and all the patterns, together with a large amount of new work, seriously damaged. It is stated that although the works had been shut down for several weeks it was the intention of the company to resume operations on the morning of Monday, February 26, with a full force of hands. The fire is supposed to have been of incendiary origin, but the loss is fully covered by insurance.

Twin Burner Process Cabinet Stove.

We present herewith a general view of what is known as the Twin Burner process cabinet stove, which is being introduced to the trade by the Twin Burner Stove Company, Johnson & Brandon, proprietors, 2020 and 2026 Walnut street, St. Louis, Mo. The stove is referred to by the manufacturers as being strong and substantially constructed, finished in a first-class manner, and the decorative features neat and effective. The hot air and vaporizing tubes extend through the top of the stove inside in such a way as to protect them while at the same time securely bracing them in position. They are connected with removable cast iron couplings which are easily taken apart, so that the vaporizers may be taken out and cleaned. These vaporizers are construced of perforated brass and the cone seats of cast iron. The cone seats are provided with wrought iron flanges, so as to protect the burner drums from heat, grease and dirt, which heretofore have been the cause of the drums either burning out or rusting off at the top. The manufacturers refer to this improvement as rendering all hot air conductors indestructible and as worthy of important consideration on the part of the trade. The burners are so fastened by a bolt as to be easily taken apart while the needle points are of pure German silver wire, making them safe from damage by corrosion or rust, and insuring a steady drip. The cone rests and cone caps are ground to an even bearing to fit air or gas tight and have no packing. This is a feature which the manufacturers claim is embodied exclusively in the Twin Burner process cabinet. The stove is provided with sight feed tubes, and the oven with double burners, a feature strongly urged by the manufacturers. The stove is provided with two burners on top and a third in the step at the left. The manufacturers refer to the Twin Burner process cabinet as possessing large cooking capacity and as occupying but small floor space. In the catalogue which the company have issued for the season of 1894, this stove is illustrated in its various styles and sizes, as are also the Twin burner step stove and junior stoves.



Twin Burner Process Cabinet Stove.

TRADE REPORT.

The Iron Market.

Reports from Pittsburgh indicate that there have been large sales of Lake Ore to furnaces in that district. It is not clear to what extent the purchases alluded to involve merely a readjustment of prices on Ore not delivered on last season's contracts. The largest producer in the Pittsburgh district is credited with having bought 800,000 tons last week, in addition to 200,000 tons of Pewabic Ore bought earlier. Since the same concern was credited early this year with carrying 500,000 tons the purchase looks very heavy. It is estimated by good authority that the Lake mining companies have contracted to date for about 1,800,000 to 2,000,000 tons.

The Pig Iron markets are pretty quiet, so far as Foundry grades are concerned. Increasing demoralization characterizes the Southern producers, who have a tremendous fight on their hands against the cheaply produced Irons made in the districts which run on Lake Ores and Connellsville Coke.

We note a sale of 5000 tons of warrants to English parties, which carries the total foreign holdings close to 45,000 tons.

It looks as though some one were eager to create the impression that Wire Rods were very scarce. Reports are conflicting, but thus far there is enough material to go around comfortably.

Negotiations for a shipment of 1000 tons of Scrap Iron to Glasgow, England, are reported to have fallen through.

Pig Iron.—Current business is light, and competition for orders coming up is very sharp, Eastern Pennsylvania and Hudson River furnaces crowding the Eastern market. A lot of about 1200 tons of No. 2 Northern Iron was sold for delivery near Boston at $12.15. Albany, Troy and the entire northern part of the State is the battle ground of the Buffalo producers, who are making prices below those at which other Irons can be laid down. From the South come reports of increasing demoralization. It looks as though the Southern Iron which is being driven back out of Western territory by local Irons will exert increased pressure upon the seaboard markets. During the past week a sale has been made of 5000 tons of warrants to English parties, thus following up sales of 3000 and 3600 tons recently made. It is estimated that from 40,000 to 45,000 tons of warrants have been taken thus far for English account. Quite a number of small Cast Iron Pipe contracts have been placed lately, among them being Tonawanda, 1400 tons for New York at $19; Yonkers, at $21.35; Pittsfield, at $21.40, and Springfield, at $22. A gas company in this city is in the market for 17,000 pieces. It is reported that this company will in all require over 70 miles of Pipe. We quote standard brands $13 @ $13 50 for No. 1; $12 @ $12.50 for No. 2, at tidewater. Southern Iron, same delivery, $12.75 @ $13.50 for No. 1; $11.25 @ $11.75 for No. 2; $11 @ $11.50 for No. 3; $11.25 @ $11.75 for No. 2 Soft, and $11.75 @ $12 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is $10 50 @ $11.

Advices from Philadelphia intimate that the demand for Pig Iron in that market is fairly in line with the supply. It has not increased as rapidly as was hoped, but it holds its own, and there is some reason to believe will begin to show improvement in course of the next three or four weeks. Prices are very low, and while they are pretty well held, there is not much chance of improvement until consumption reaches larger proportions than at present. Prices are more uniform than they have been for a long time past, 50¢ ℔ ton being about the extreme range in any of the grades; that is to say, $13 being about a very inside figure for No. 1 Foundry, and $13.50 the extreme outside. General quotations for Philadelphia and equivalent points are about as follows:

No. 1 Foundry	$13.00 @ $13.50
No. 2 Foundry	12.25 @ 12.75

In the Chicago market a fair volume of business is reported in local Iron, but the large majority of transactions have been in small lots, with but a slight sprinkling of good sized contracts. Sales of Southern Iron are still in small quantities only and now run mostly to Nos. 1 and 2 Soft, which are wanted as a mixture with the harder Northern Iron. Lake Superior Charcoal is very quiet with but little inquiry. Quotations are given as follows, for cash:

Lake Superior Charcoal	$15.30 @ $15.50
Local Coke Foundry, No. 1	12.00 @ 12.50
Local Coke Foundry, No. 2	11.50 @ 12.00
Local Coke Foundry, No. 3	11.00 @ 11.50
Local Scotch	13.00 @ 13.50
Ohio Strong Softeners No. 1	13.50 @ 14.50
Southern Silvery, No. 1	..... @ 12.50
Southern Silvery, No. 2	..... @ 11.75
Southern Coke, No. 2	11.50 @ 11.65
Southern Coke, No. 3	11.00 @ 11.50
Southern, No. 1, Soft	11.50 @ 11.65
Southern, No. 2, Soft	11.00 @ 11.50
Tennessee Charcoal, No. 1	16.00 @ 16.50
Tennessee Charcoal, No. 2	..... @ 15.00
Alabama Car Wheel	18.50 @ 18.65
Jackson County Silvery	15.00 @ 16.00
Other Ohio Silvery	13.00 @ 13.50
Coke Bessemer	12.00 @ 12.50

The same discouraging condition of the Pig Iron trade noted for the past two or three weeks continues in the Pittsburgh district, and prices are reported as showing a weaker tendency, under the influence of recent sales of Ore on the basis of $2.75, Cleveland. The market continues to be characterized by purchases of hand to mouth character, no large blocks being in negotiation and none are expected until the market is more settled. Foundry Iron is in fair demand, inquiries being better than for some little time past. We quote the market as follows:

No. 1 Foundry	$12.00 @ $12.25, cash
No. 2 Foundry	10.75 @ 11.00 "

The general feature of the Southern Pig Iron market is weakness, and it is evident that round lots of Southern Coke Iron could be bought at lower prices; there have been sales of 2000 tons No. 2 Soft Foundry Iron at $7, f.o.b. Birmingham, and for No. 2 regular it is said that $7.25 has been shaded; in fact, the whole market for Southern Foundry Coke Iron is so much demoralized that there appear to be no settled prices, but it is strongly asserted that a reduction of fully 25¢ ℔ ton could be obtained on all grades. There is rather more demand for small lots from the jobbing foundries, the orders being more frequent and for increased quantities, more frequently running up to 100 to 200 tons, but the aggregate volume of business is still so small as to discourage furnacemen and their agents. There is not much demand for Charcoal Iron, but the better qualities of standard Car Wheel Iron are firmly held. Quotations are merely nominal, as follows:

Southern Coke, No. 1	$11.00 @ $11.25
Southern Coke, No. 2	10.00 @ 10.25
Southern Coke, No. 3	9.50 @ 9.75
Ohio Soft Stone Coal, No. 1	14.50 @ 15.50
Ohio Soft Stone Coal, No. 2	14.25 @ 14.50
Lake Superior Coke, No. 1	13.00 @ 13.50
Lake Superior Coke, No. 2	12.00 @ 12.25
Hanging Rock Charcoal, No. 1	17.00 @ 17.50
Hanging Rock Charcoal, No. 2	16.50 @ 17.00
Tennessee Charcoal, No. 1	13.50 @ 14.00
Tennessee Charcoal, No. 2	12.50 @ 13.00
Standard Southern Car Wheel	16.75 @ 17.75
Lake Superior Car Wheel and Malleable	16.50 @ 17.00

Metal Market.

Pig Tin.—Prices have undergone a further decline in the wholesale market, but the change is not felt in small lots. The weakness may be attributed chiefly to London depression caused by heavy European stocks of Tin, the unsettled condition of the Silver market and of Eastern exchange. In any event there have been no distinctly "bearish" local features, nor have there been any signs of unusual pressure to sell.

Copper.—The fairly large business referred to last week has had no visible effect upon the general market. In any event nothing more than routine trans-

actions have come to notice, and the almost invariable report is that both home trade and export demand are extremely tame at the moment, while prices remain stationary.

Pig Lead.—Business has been very moderate in this market. Negotiation has also been tame. In short, dullness stands out prominently as the conspicuous feature. In prices in the wholesale market hardly any change has taken place, while in small quantities quotations remain the same as last week.

Spelter.—Dealings in this quarter have been very commonplace. The demand has not turned for the better. The offering has reflected no change in the attitude of sellers. In fact, the market has remained flat, showing no response to late reports of contemplated combination of smelters. In the jobbing trade, however, there is a slight stiffening in prices.

Tin Plates.—In some lines of Plates for prompt and early delivery business has increased slightly, but no signs have appeared of anything in the way of general improvement. This tendency toward a stronger market is noticeable particularly in Coke Tins, other kinds of Plates not being appreciably affected.

A London dispatch to *The Iron Age*, under date of February 28, refers to the market as follows: Business in Tin Plate has been moderate. Buyers seem still to limit orders to immediate wants, although making more inquiries. The impression is that business is likely to continue until buyers offer better prices, since makers are more disinclined to do business at a loss. Several makers have refused to enter orders at prices that were accepted a week ago. Black Plates are held at somewhat higher prices. The Pontymister workmen have given notice of termination of their contracts, owing to a dispute on Saturday with the owners. Liverpool prices are quoted as follows:

IC Charcoal, Alloway grade.....12/3 @ 12/9
IC Bessemer Steel, Coke finish. ...10/6 @ 11/

Sheet Iron.—Writing of the Western market our Chicago correspondent says: Manufacturers of Black Sheets are soliciting business more keenly than ever, and exceptional inducements are being offered to buyers to place their contracts for the season at this time. The business in Galvanized Iron is extremely dull, as consumers are holding off in the expectation that prices may go lower. This is rather doubtful, as manufacturers are now discriminating on the list and some are refusing to take any business whatever on heavy guages. They claim that it is a waste of time and trouble to galvanize Sheets, and therefore would prefer to sell them as Black Sheets, rather than put them through the galvanizing process.

Chicago Report.

Scrap.—Business is quiet in Old Material. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	...
Machinery Cast	6.00	...
Malleable Cast	5.00	...
Stove Plate (free of burnt)	4.00	...
Burnt Iron and Grate Bars	3.00	...
Sheet Iron and Hoops	2.00	...
Plow Steel and Breaking Stock	4.00	...
No. 2, such as Shovels, Hoes, &c	3.00	..
Old Boilers—whole (Iron)	3.00	...
" (Iron)—cut in single Sheets and Rings	5.00	...
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5 ¢

THE STANDARD TURNING WORKS, Cambridgeport, Mass., send out circulars announcing that they are preparing to do all sorts of work in the turning line, making every variety of Handles, or anything of a similar nature. They have a large stock on hand and are prepared to do work in common and fancy goods and ivory. Accompanying their circular they send out a box filled with a miscellaneous assortment of samples. These include a wide variety of turned Handles made from different sorts of wood and finished in various ways by staining, polishing, enameling, &c.

NOTICE IS ISSUED to the trade from Yonkers, N. Y., under date of February 13, by Joseph M. Stoughton, receiver of the W. F. Washburn Brass & Iron Works, that the works are now running under an order of the Supreme Court.

FRANCIS I. MAULE, 28 Cheatnut street, Philadelphia, Pa., sends out a pamphlet of interest to advertisers. It is gotten up in the original style characteristic of Mr. Maule's work.

CONDITION OF THE

Hardware Trade.

FEBRUARY CLOSED with only a moderate volume of current business, the aggregate of the month's trade, however, having been fair. It is hoped that trade will assume a more normal activity during March. Prices are without important change, being somewhat better on such leading goods as Barb Wire and Wire Nails, owing in part to concerted action by the manufacturers, and also to a reaction from the extremely low prices which have been ruling for some time. In most lines, however, the market is not especially strong, and manufacturers are showing a disposition to shade prices to secure business. There is some complaint in regard to collections, but on the whole they are referred to as fair.

Advices from Chicago.—The character of the Shelf Hardware trade is changing to some extent. The demand is running a little more to straight Hardware and less to staples than has been the case from the beginning of the year up to a very recent date. Merchants are more closely examining into the character of their stocks, and finding that they need Builders' Hardware and other shelf goods for spring business are ordering a little more freely in this line. The demand for staple goods and seasonable goods has perhaps fallen off in about the same proportion, so that the volume of business can hardly be said to have improved. The change toward straight Hardware nevertheless is appreciated by the jobbers, who are anxious to see considerably more movement in this branch of their trade, from which better remuneration is ordinarily obtained. The Heavy Hardware jobbers are feeling serious results from the recent heavy snowstorms and the cold weather which followed. Their trade has fallen off, and the shrinkage in the volume of business has at the same time been attended by efforts of sellers to increase business by offering concessions in prices. The only effect thus far has been to demoralize buyers and cause them to defer purchasing in the hope that they may be able to do still better. The low prices made are affecting such articles as Carriage Bolts, Machine Bolts and other staple goods of the same class. Prices on iron and steel are dropping, and it is not yet apparent that bottom has been struck.

Notes on Prices.

Wire Nails.—The volume of business is fair and with the orders booked during the past month or two the manufacturers will be well occupied for some time to come. In the matter of price the market is in excellent condition and has a firm tone. Manufacturers are adhering to the quotation of $1.10 for carload lots at factory, and

in some cases are naming a somewhat higher figure. The good understanding which exists between the manufacturers of Wire Nails and Barb Wire contributes not a little to the strength of the market, especially in view of the action which has been taken in regard to the raw material. At the present time it is thought by some well informed parties that existing quotations will be not only maintained but that slight advances in the near future are not unlikely.

Advices from Chicago.—Low prices on Wire Nails now appear to be a matter of the past. Present indications favor an advance in the near future, depending on the disposition of the leading manufacturers. They have gained absolute control of the situation in some essential particulars. They have in connection with the Barb Wire manufacturers bought the surplus product of the active wire rod mills up to July 1 and have in addition succeeded in removing some competition in the Wire Nail trade, which might have proved annoying during the next month or two. It is likely that some large merchants who were resting in the belief that they had secured very low contracts on Wire Nails may suddenly find that these contracts are with parties who will not be able to fill them. The replacing of such contracts on the market under present conditions can hardly fail to have a decidedly stiffening effect on prices. The actual volume of business within the past week has not been large, but inquiries were good and considerbale trade is in sight which must speedily be closed. Manufacturers' prices are continued at about $1.20 to $1.25 Chicago, while small lots from jobbers' stocks are selling at $1.25.

Cut Nails.—There is little new to report in the Cut Nail market. The volume of business is fair, but not heavy. Prices are, however, quite well maintained on the basis in the East of $1.05 for carload lots on dock, New York, the manufacturers adhering strictly to their policy recently adopted of quoting only prices for Nails delivered. The Western market continues steady at $1 to $1.05 at mill. The price from store in New York is firm at $1.15.

Advices from Chicago.—An excellent week is reported in Cut Steel Nails. Good orders have been received from the greater part of the Northwestern territory, as well as in other sections which are not usually regarded as tributary to this particular market. While the volume of business in Cut Nails cannot be said to show remarkable growth, at the same time it is of a character to give considerable encouragement to the local manufacturers. Outside factories are doing very little at present in this locality on account of the close prices made here. Quotations are continued at $1.05 Chicago, on a 60 cent average for factory lots. Jobbers are selling small lots from stock at $1.15 to $1.20.

Barb Wire.—The recent advance in the price of Barb Wire has had the effect of checking for the time being the demand, but a good many orders representing in the aggregate a considerable quantity of Wire have been placed at the new prices. The manufacturers are evidently working together in harmony and their agreement tends to give the market a steady, if not a strong tone. Quotations for carload lots of Four-Point Galvanized are as follows: Pittsburgh, $2.15; Cleveland, $2.20; Cincinnati or Allentown, $2.25; Chicago or New York, $2.35. An advance of 5 cents per 100 pounds is made on less than carload lots.

Advices from Chicago.—The influences prevailing in the Wire Nail trade are operating in precisely the same way in Barb Wire. Manufacturers are well supplied with orders, and business is coming in quite freely, so that the outlook is good for a large spring trade Stocks have been even lighter in manufacturers' and merchants' hands than those of Wire Nails, and there seems to be no reason why there should not at an early date be a heavier movement in Barb Wire than was seen last month in Wire Nails. If this is the case, prices will very probably advance materially. Manufacturers' quotations on Galvanized Barb Wire are now $2 35, Chicago, while small lots from stock are selling at $2.35 to $2.40.

Lape's Scissors Sharpener.—The Sharpener which is put on the market by W. E. Lape, Syracuse, N. Y., is sold to the trade at $1.50 per dozen net.

Ball Bearing Well Wheel.—This Wheel is put on the market by the T. F. Cheriton Hardware Company, 62 Reade street, New York. The Wheel is sold to the trade from the following list, which is subject to a discount of 35 per cent.:

	Per dozen
No. 01, Japanned Well Wheel Pulleys 10 inch	$8.00
No. 02, Japanned Well Wheel Pulleys, 12 inch	12.00

Glass.—The situation in the Glass market remains practically the same as last week, as far as demand and quotations are concerned. There is a desire on the part of manufacturers whose factories are in operation to secure orders even at a concession from regular quotations. It is reported that factories having a capacity equal to 262 pots have closed down within the past ten days, and that the number of pots, or their equivalent, now making Glass is 878 out of the 1800 pots in the country. During the month of March large orders for Glass are generally placed with manufacturers and jobbers, so that developments in this direction for the next 30 days will be watched with much interest. Pittsburgh quotations are reported as 85 and 10 and 5 per cent. discount for single strength, and 85 and 20 and 5 per cent. discount for double strength Glass. It is understood that more favorable prices are obtainable from both Eastern and Western factories.

Trade Notes.

It gives us pleasure to announce to the many friends of Wallace & Sons, the proprietors of the Brass and Copper Rolling Mills at Ansonia, Conn., with warehouses at 29 Chambers and 5 Reade streets, New York, who last summer, owing to the stringency of the money market, were obliged to go into the hands of receivers, have made a settlement of their affairs with their creditors and the receivership has been vacated. The business of Wallace & Sons has never been discontinued, the receivers having run all the mills during the time they were in charge.

A. Dardell, 292 George street, New Haven, Conn., is putting on the market The Best Ventilator for facilitating the draft of chimneys.

The Columbia Corrugating Mfg. Company, Niles, Ohio, have just completed the erection of a factory measuring 60 x 200 feet, and which has been fitted up with improved machinery. This addition to the plant will considerably increase the capacity of the above concern.

Miner & Peck Mfg. Company of New Haven, Conn., in addition to their regular line of Peck Drop Presses, are about to place on the market a line of Friction Drop Hammers, which are said to possess new and valuable features, the result of long experience and study of the subject.

A large sale of Granite Iron Ware is announced among our Special Notices by E. Bissell, Son & Co., 12 Murray street and 15 Park place, New York. The sale is by order of the St. Louis Stamping Company, and will take place on Wednesday and Thursday, March 7 and 8.

Merry & Clark, 535 West Fifteenth street, New York, issue a notice to the trade informing their patrons that they have secured the agency for the corrugated conductors, eave trough, gutters, elbows, &c., made by Clark, Quien & Morse, Peoria, Ill., and that after March 1 they will carry a stock of from 50,000 to 100,000 feet of assorted sizes of galvanized iron corrugated round and square conductor pipe. They call attention to the fact that this corrugated pipe is made from but one piece of metal, lock seamed and in 8-foot lengths.

The *Silk Herald* of Paterson, N. J., says that among the thousands of people engaged in the silk industry, scattered through the United States, four-fifths are out of employment at the present time.

It is but a short time since New York builders were bewailing the utter absence of life in their line of business. A New York City journal reports, however, that cheap building materials are now causing "an epidemic of office buildings and apartment houses."

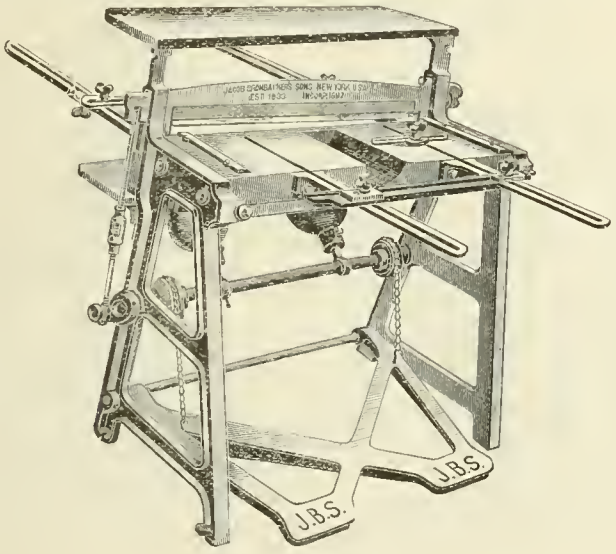
French economists are concerned at the discovery that savings banks deposits in that country have shrunk more than 16 per cent. in the past two years.

New Square Shears.

We show in the accompanying illustration a new square shears that is being put on the market by Jacob Brombacher's Sons, 30 Cliff street, New York. The special feature of these shears is that they cut twice with every operation of the treadle, and that in the machine springs are deue away with entirely. The shear is particularly adapted to factories, and it is pointed out that as every operation of the treadle cuts twice it saves 50 per cent. of the time as compared with single cutting shears.

SCRAP.

In a review of the British tin plate trade of last year the London *Ironmongers' Chronicle* sums up the situation as follows: "The year 1893 has heen a phenomenal one as far as tin plates are concerned. During the whole year the market has witnessed a steady decline, without a single fluctuation of any moment in the contrary direction, the closing price being the lowest ever recorded in the history of the trade.



New Square Shears.

Even this does not seem to be the bottom, for in the current month prices have been reported slightly lower, though this reduction is not general. No doubt the declining prices of tin and steel have helped tin plate makers to face the market, but they are all professing inability to sell at current rates without a loss. At present about 35 per cent. of the mills are shut down, and no rise in values seems probable until the American tariff is definitely settled one way or another."

Gummey, Spering & Co., Philadelphia, Pa., issue circulars directing attention to Gummey's anti-pin hole bright tin plate, which they describe as the only absolutely anti pin hole plate ever made. The trade are well aware how much trouble was experienced in securing plates that would be proof against this inexplicable difficulty of pin holing. We learn from Messrs. Gummey, Spering & Co. that, after an actual test of two years, they are satisfied that they have entirely overcome this defect, which has baffled the efforts of the most expert makers of bright tin plate.

The Continental Tin Plate Works, Twenty-sixth street and Washington avenue, Philadelphia, Pa., of Gummey, Spering & Co., have been running continually since they started, June, 1892, except for a few days in November and about a week later for repairs. They are turning out an extensive assortment of tin and terne plates, including some 18 different brands. In point of popularity the manufacturers especially allude to the Climax, Phenix and Pennsyl Old Method. The latter brand is now being placed on the roof of the Harrison Estate Building, Tenth and Market streets, Philadelphia, the roof requiring 250 boxes of 20 x 28. The Alderly brand they refer to as having been importing and selling for many years, but they are now making it at their own works. These plates are described as all pure American, being made from American black sheets by American labor.

N. & G. Taylor Company, Philadelphia, are sending out to the trade a circular directing attention to the merits of the Taylor Old Style brand of roofing plates. In their letter they refer to the injurious effect of acid flux in the manfacture of tin plate, and also make some observations on the use of palm oil. With thia circular is a *fac-simile* reproduction of a letter from M. Samson, Independence, Mo., in which the writer refers to a lot of Taylor Old Style tin shipped by Taylor & Co. which had been on the roof of his store building for 30 years and never had any paint on it. Samples of this old roof are sent around with the circular letters and bear striking witness to the excellence of the material, the plate showing the marks of time, but not revealing any corrosion through the iron. In other words, it is as water tight as the day it was put on, which is an excellent record for 30 years' exposure.

The Cornish tin mining industry, according to the reports of English journals, is just now at an exceedingly low ebb, Prices have receded to the lowest level and there is no assurance that they will advance for some time to come.

A company has been organized and incorporated in Wisconsin for the purpose of building a canal from Lake St. Clair to Lake Erie, thus avoiding the dangerous places in the present route and shortening the route from West Superior to Buffalo by 100 miles.

Plumbers' Apprentices.

The apprentice question is attracting much attention among the plumbers. The master plumbers' associations in numerons localities are endeavoring to come to some positive understanding in taking apprentices, so as to put the matter on a more satisfactory basis than has hitherto been the practice. It is very difficult, however, to establish regulations which will be thoroughly satisfactory to everybody. A very carefully prepared plan was not long since rejected by the Chicago association, notwithstanding the efforts of a very able committee to formulate a system of apprenticeship that would be just and equitable to all concerned. At a large meeting of the Minneapolis plumbers a most animated discussion occupied the entire evening and yet was wholly without result. It would seem not a very difficult matter to adopt a few simple regulations which would cover the whole case and stop all trouble. When the attempt is made to cover by positive rules every possible contingency that may arise, more or less difficnlty is always encountered. Few rules and a little chance for modification in special instances would answer the purpose far better and stand a better chance for adoption. The question should be settled before spring work begins.

Waste and Repairs.

It has been pretty thoroughly demonstrated by this time that waste and repairs are very uncertain elements on which to depend for any considerable volume of business. Even a population of 70,000,000 of the most enterprising and usually the most extravagant people on the face of the earth can, when they are forced to economize, cut down consumption in a most disheartening way for those engaged in the business of manufacturing or distributing supplies. The philosophical view of the situation is that in a reasonable time everything in use must wear out or become unfit for further service. Replacements will then be made, causing a fair degree of activity in business circles. But when people are economizing nothing seems to wear out as rapidly as when they have the means to buy freely, and replacements are only made at very long intervals. The United States when prosperous is the best market in the world, and the purchasing power of its people *per capita* is far beyond that of any other country, but the United States when in adversity is perhaps no better than the average European country. Expenses must be contracted within incomes, and if the incomes are light the expenses will be light perforce.

Future Consumption.

If the business of the United States should for any reason from this time forth be strictly limited to the actual necessities of its people there would be no future for the manufacturing establishments now standing idle. Those in operation could easily supply all wants, and perhaps not strain their facilities to meet the requirements of some substantial growth in the population. This is almost an assertion that a large part of the manufacturing and commercial facilities of the country is superfluous, and has been built up far beyond our needs. It would be true if our present condition were normal. But this stringent economy, this greatly restricted consumption, is not the natural condition of Americans. They may be depended upon to work out of it, slowly, perhaps, but surely; and the time will come when enterprise will displace timidity, frugality will give way to liberality and consumption will increase in every channel of trade. The masses will then be again well employed, and their earnings will again sustain the fair commercial fabric whose glory is now so sadly clouded.

Ex-Mayor Abram S. Hewitt proposes that, as private capital cannot be induced to provide rapid transit for New York City, the city should advance the capital for and own the new road, leaving its construction and operation in the hands of a corporation. Mr. Hewitt's plan has been approved by the New York Chamber of Commerce.

For some hours of one day, recently, the city of Buffalo was absolutely without water owing to the failure of the natural gas supply, which is used to run the engines at the pumping station. As a similar mishap occurred a month or so ago, the city government has decided to begin the entire substitution of coal for gas, the supply of the latter being deemed too uncertain to risk its continuance as fuel.

Cleaning Castings With the Sand Blast.

The principle of using sand as an abrasive by propelling it through a blast at high speed, which was invented by J. C. Tilghman of Philadelphia, has been used for some years in England by the Tilghman's Patent Sand Blast Company, Limited, at Sheffield, for the removal of molding sand, scale, &c., from steel, iron and brass castings, forgings, plates, and also for cleaning the atone work of public buildings. For propelling the sand compressed air at from 8 to 10 pounds pressure per square inch is employed. Chilled iron globulea instead of quartz or flint sand are used with good results, both as to speed of working and cost of material, when the operation can be carried on under proper conditions. With the expenditure of 2 horse-power in compressing air 2 square feet of ordinary scale on the surface of the steel and iron plates can be removed per minute. The surface thus prepared is ready for tinning, galvanizing, plating, bronzing, painting, &c. The innumerable little indentations form an excellent anchorage for the protecting materials, causing them to adhere with much greater force than to an acid or otherwise cleaned surface. The advantage of this method of cleaning castings is that it acts with equal rapidity and thoroughness upon flat, curved, angular and indented surfaces. By continuing the operation the hard skin on the surface of castings, which is so destructive to the cutting edges of milling and other tools, can be removed. Small castings are placed in a sort of slowly rotating barrel open at one or both ends, through which the blast is directed downward against them as they tumble over and over. No portion of the surface escapes the action of the sand. Plain cored work such as valve bodies can be cleaned perfectly both inside and out. One hundredweight of castings can be cleaned in from 10 to 15 minutes with a blast created by 2 horse-power. The same weight of small forgings and stampings can be scaled in from 20 to 30 minutes. We understand that those who have developed the Tilghman process in England contemplate starting a similar business at an early date in Philadelphia, J. S. Mathewson, managing director of the company, having been in the employ of Mr. Tilghman since 1870. We understand that Mr. Mathewson, Mr. Tilgman and his brother, who reside in Philadelphia, are the sole proprietors of the business, which, therefore, seems destined to return to this country after years of development in Great Britain.

Southern journals agree in discerning a solid and genuine revival of business prosperity in the South; the result, largely, of organized effort to attract investment to the centers of population and to advertise the towns. The revival does not partake of the nature of a "boom," but is an honest advance in growth and values, which bids fair to be permanently progressive.

The Cleveland, Ohio, Chamber of Commerce is arranging for the celebration in 1896 of the city's centennial.

THE LETTER BOX.

A Stove Repair Suggestion.

From F., *Virginia.*—I notice in *The Metal Worker* something about marking stove repairs. I think that stove makers ought to furnish dealers with a list of all their stoves which have interchangeable parts, as it is frequently found that parts of one stove will fit a stove of a different name. If the dealer knew all such interchanges he might prepare to supply repairs for the various named stoves without having to order specially for each stove.

When a stove is brought to the shop for repairs there is a chance to try such parts as are on hand. But when a customer wants a grate, fire brick or cross piece he does not want to haul his stove to the shop, but comes or sends for the pieces wanted, and hardly ever can give the right directions for ordering, which makes delay, and the freight on small parcels eats up the profit, to say nothing of packages lost in transit and never found. If each stove maker would furnish a list of all his stoves, with description of parts fitting the different named and numbered stoves, a stock of repairs could be carried to suit the stoves in use in each section, which would be the means of saving a great deal of writing, booking, collecting small bills, postage and freight on those troublesome little orders.

This is submitted for the consideration of the stove trade generally, and comment solicited.

No Regulation.

From J. D, *Brooklyn, N. Y.*—Will you kindly publish the plumbing regulations of Plainfield, N. J., in relation to new work? Can a New York plumber do the plumbing work in a new house, and what are the cost of sewer and water connections to plumbers?

Answer.—We learn from a Plainfield plumber that there is no ordinance in that city governing plumbers and plumbing work. A fee of $10 is charged by the water company for tapping the main. There is no system of sewers.

Objects to Exposed Piping.

From L. W. F., *Earlville, N. Y.*—Will *The Metal Worker* inform me in an early issue the proper way to pipe a range boiler? My customer does not want the pipes to appear around the side of the room, which is nicely finished, yet wants hot water at the sink, across the room from the boiler. Can the piping be taken off the top of the boiler in the usual way and then run down and under the floor, across to the sink, and then rise to the faucets? If piped as suggested, will the job give satisfaction?

Answer.—Many boilers are in use piped as described, giving satisfaction, though some annoyance has in some cases been experienced from an accumulation of air in the bend where the pipe turns down at the top of the boiler, if no pipe is run direct to an upper floor. The annoyance, however, has never been sufficient to condemn such a method of piping.

Better Marked Stove Repairs.

From W. H. Drummond & Sons, *Newark, N. J.*—In answer to "J. F. T.," Meadville, Pa, in *The Metal Worker*, February 10, we send a tag that we use which has been found very satisfactory. As soon as the repairs arrive the tag is attached to them and a postal card sent to notify the customer.

MEMORANDUM OF ORDER.

Ordered for *James Smith.*
Address, *74 Summit street.*
Name and No., *8-20 Domestic.*
Date, *1881.*

1 grate,
1 guard plate.

Price, *$2.50* 189
Deposit, *1.00* Order Forwarded,
Due, *$1.50* *February 24*, 1894.

STOVE REPAIR DEPARTMENT OF
W. H. DRUMMOND & SONS,
85-87 MARKET STREET, NEWARK, N. J.

Choked Flues.

From V. T., *La Crosse, Wis.*—Please state in *The Metal Worker* which would be the most desirable chimney on a permanent building, a square brick chimney or a round iron smoke stack, giving hight and area, to serve a horizontal tubular return flue boiler 2 feet in diameter and 8 feet long, having 25 2-inch flues. This boiler is now placed in the ordinary brick setting, having 2 foot grate bars and a patent water back and connected with a 12-inch smoke pipe about 6 feet long having a rise of 20 inches and two easy curve elbows, terminating in a brick chimney 14 x 14 inches about 13 feet high. This chimney is capped out with a 15-inch round sheet iron smoke stack about 20 feet high, making a total hight of 33 feet. The boiler, which is on a farm, has been in use a number of years, and is still being used for cooking feed and furnishing steam for a small engine located in a one-story building, far enough from the other buildings so that the wind seems to have no influence on the draft. The draft, however, seems at all times to be very poor. The fuel used is principally dry hardwood, though some pine edging and possibly some corncobs may have been used. Is the flue too large and would you recommend a smaller flue instead of the present one? It is presumed that all the openings in the chimney are closed.

Note.—Our readers are invited to give their views on this subject. In the meantime we would suggest that the brick chimney has always been regarded as more permanent than an iron smoke stack. However, the use of wrought iron chimneys is growing, owing to the satisfaction they give on all points. The chimney reported here seems to have ample capacity for the boiler with which it is connected, and is sufficiently high to do good service. From the character of the fuel used, we are disposed to think that the trouble arises from the flues being choked with soot and fine ashes, and that if the tubes and main flue of the boiler are thoroughly overhauled and cleaned better service will be rendered by the chimney. The chimney has capacity for a larger smoke pipe from the boiler than is now used in connecting it, and an increase in the size of this pipe may improve the conditions. From the use that is made of the boiler at present it is possible that a smaller chimney would be more satisfactory.

Size of Pipe.

From J. J., *Wilmington, Del.*—In reading some of my old *Metal Workers* I find the trouble of "R. J. M." in *The Metal Worker* of December 9, in which he is unsuccessful in heating his radiator from range boiler. I think his trouble is from using too small pipe. In hot water fitting the supply pipe to one or more branches generally has an area equal to the combined size of the other pipes, and if he will enlarge his hot water supply pipe I think that some of his trouble will be remedied. He will need an increased water back capacity, as I understand his case.

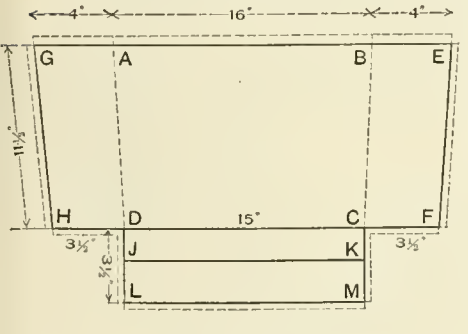
What Caused the Collapse?

From R. D., *New York.*—In reply to "H. D.," whose letter appeared in *The Metal Worker* of February 10, I attribute the collapse of the boiler to the following causes: First we have a column of water 6 feet high, which will exert a pressure of $2\frac{5}{10}$ pounds without allowing for friction, but owing to the long run of piping, the sharp bends, and the lowering of the water in the supply tank, I doubt if there would be $\frac{1}{2}$ pound pressure in the boiler. Therefore, a slight pressure formed in the boiler would stop the supply entirely. While under such conditions, suppose that a cold water faucet is opened. The water will start from the point of the greatest pressure, and that is from the boiler, and it will be seen that all of the water will be syphoned out of the boiler. When the faucet is closed the supply starts again, and the cold water coming in contact with the hot water and steam causes the noise heard. There is a vacuum formed by the condensation of

the steam in contact with cold water, and before the boiler can fill the collapse takes place. A horizontal check valve on top of the boiler would stop the syphoning. The expansion pipe should be taken to the furthest end of the system shown, and connected at the sink. This would keep that line circulating, and afford some relief through the water being cooled.

Construction of Range Reservoir.

From C. M. W., *Spencerport, N. Y.*—I send a method for constructing a range reservoir, with little waste of material. Suppose the required article to measure 8 x 16 inches at top, 7 x 15 inches at bottom, and to be 11½ inches high. First lay out the side, as shown by A B C D, and then add the half ends, as B E F C, A D H G. If the material is of sufficient width on D C draw the half of bottom, as indicated by D C M L. If the material is not of sufficient width a piece may be required, as indicated by J K M L. Two pieces



Construction of Range Reservoir.—Pattern for Half of Reservoir.

similar to that shown in the engraving are required for the article, and the forming is to be done on lines B C, C D and D A. The usual allowances for edges are to be made, as indicated by the dotted lines.

Difficulty with Drive Well.

From H B., *Woodhaven, L. I.*—If "M. W." of Little Falls, N. Y., who made inquiry in *The Metal Worker* of February 10, will examine his driven pipe and finds it all right—that is, straight down and the point not more than 26 or 28 feet below the valve in the pump—then his pump should work. Two or three feet of water in a driven pipe is never sufficient to supply the wants of a pump cylinder of ordinary size, therefore let him drive 5 feet deeper and get a good supply of water, provided he will reach sand or gravel. We have here 5 to 8 feet of water and then 2 to 4 feet of clay. Water will never enter the point in the clay, consequently the handle flies up from a vacuum being formed in the pipe. He may find the pipe is old and rusted out, and in that case he would have to drive a new well.

From I. K., *Shelbyville, Ind.*—Not having seen anything in the Letter Box from Indiana for some time, we "Hoosiers" thought we might help "M. W." in getting his driven well to work. He should pull up and clean his point, then rub it thoroughly with bar soap until the meshes of the strainer are all full, then put his point down to where it reaches gravel and water. Take his sand pump on ⅝-inch pipe and put it in the point and agitate the water and soap and it will wash the screen clean. Then if he has plenty of water his pump will work easily. After he has tried this let me hear from him. I have been in the business for years and know this method works when all others fail.

A Pump is Best.

From J. H E., *York, Pa*—Being a constant reader of *The Metal Worker*, I desire to ascertain through its columns if there is any kind of an appliance made to lift water from the level of reservoir pressure to a higher point? To explain more fully, I have a ⅝ lead pipe running from street main through cellar up to kitchen sink, but the water will only flow 2 feet above the floor. Now, is there anything to force the water up to the attic tank 15 feet from the water level? If there is, I would like to know of it and where it can be bought.

Note.—Some of our readers may have discovered a method of raising water different from the old and generally used plan. We would suggest the use of an ordinary pump as being the least troublesome and probably the most satisfactory. Of course, rams or water motors could be used, but it is hardly likely that they would be practicable.

Seamless Zinc Tubing.

From A. R. B., *Minneapolis, Minn.*—Can you inform me who manufactures seamless zinc tubing?

Note.—So far as we can discover seamless zinc tubing is not made, but if we are mistaken in this we shall be glad to be informed of the name of the manufacturer.

Left Handed Tinners.

From E. L. H., *New York.*—In answer to "Right Hand," Pennsylvania, whose letter appeared in *The Metal Worker* of February 24, would say that I have a man who has worked with and for me all of 15 years. He is a first-class workman in every respect, either on the roof, on a ladder or in the shop at the bench, and is as good an all around man as I ever saw. He solders left handed, handles the snips and bench shears left handed, hammers left handed, uses his left hand for cutting and finishing and, in fact, never uses his right hand, except in the same way that a right handed man would use his left. I have seen my left handed man do work on a roof where any right handed man would appear worse than an apprentice alongside of him.

From LEFT HANDED TINNER, *Pennsylvania.*—I notice in *The Metal Worker*, February 24 the letter from "Right Hand." I also am a Pennsylvanian, but I decidedly disagree with my fellow countryman. I am a born left handed man, and when I found that my left hand was not so useful in the tin trade I was going to use the right altogether, but my employer told me to use both, as he said I would find it useful all through the trade. So I took his advice and found that he was right. It is especially convenient when I have to solder all day, for I can change the iron from one hand to the other, and in other work it is similarly useful. I do most of the work with my right hand, and I think a left handed man can become more active with his right hand than a right handed man can with his left. The great advantage of using both hands is that one is able to get to places with either hand where he would find it very awkward if he could only use his right hand.

From E. W., *Pulaski, Va.*—I notice the letter from "Right Hand" in *The Metal Worker* of February 24. His little story of the left handed boy who was just learning his trade was very amusing, but I am impelled to ask him if the reason the boy melted so much solder was that the soldering iron was used so long right handed that it wouldn't work any other way. I am a left handed tinner, and in my 15 years' experience I have worked with many right handed tinners as well as many left handed ones. I have never had a left handed tool made and find no inconvenience in handling any tinner's tools and have often felt sorry for right handed tinners when they have to do something where I had the advantage of them.

Troublesome Terra Cotta Chimney.

From J. S. B., *New Berlin, N. Y.*—I have a warm air furnace in my cellar, and to avoid running pipe through rooms above I built out of doors, back of my dwelling, a chimney of 10-inch vitrified sewer pipe 35 feet high, cementing all the joints tight. I connected the smoke pipe from the furnace to the chimney directly from the cellar. The chimney had a good draft and worked well in every way for about four weeks. Then I found if a check damper in the smoke pipe, which opens and leaves a hole in the same, was left open four or five hours that there was not a particle of draft in the stove pipe. Paper saturated with kerosene when ignited would immediately become extinguished when thrust in the check damper hole in the smoke pipe, and it would take from 15 to 20 minutes for paper saturated with kerosene oil to burn in the fire box of the furnace in order to start the draft again. What is the matter, and what is the remedy?

Note.—The experience of our readers with terra cotta chimneys will be gladly received. In this case the trouble seems to be caused by the air entering through the check draft and thoroughly cooling the chimney, so that there is nothing to create an upward current of air in it. The remedy would be to so arrange the check draft that there will always be some hot air or gases passing from the fire to keep the chimney warm enough to create upward currents. The thickness of the pipe is not sufficient to retain heat for a long time and being entirely exposed to the outside atmosphere it is quickly cooled. The capacity of the chimney is greater than the furnace requires, necessitating that the draft be checked, and it is probable that a 7-inch pipe would have been more satisfactory, as then the fire would need less check and the terra cotta flue would not become so cold as to stop the draft.

STEAM AND HOT WATER.

Radiator Connections and Mains.

BY HELIOS

Fig. 1 shows a two-pipe connection to a radiator. It is not good practice in placing a one-pipe steam apparatus to use a one-pipe connection to a radiator that has 100 feet of heating surface or over, unless the radiator has a base with a large apace in it. With a radiator having the sections connected together with nipples, the opening through the radiator is so small that a perfect circulation cannot take place and the radiator is liable to fill with water. If the radiators have over 100 feet of heating surface and they are connected together with nipples, use the connection shown in Fig. 1 and place in the return pipe a swing check valve. Be sure that the return pipe that has the check valve in it is level, for if it has a drip to the return pipe the valve will not close tight and steam and water will back up into the radiator when the valve on the radiator is closed.

Fig. 2 shows the manner of taking a connection from the main steam main to a riser that is to go up in the corner of a building. The main steam pipe has a drip from the boiler, as shown by the arrows. The branch pipe is taken off after the pipe has passed the corner, the branch being taken from the top of the steam main. This supplies dry steam and allows for the expansion of the main pipe, and also allows for a good drip from the riser back into the main steam pipe.

Fig. 3 shows connections to a heater. The steam main is carried from the boiler as near the ceiling as is possible, with allowance for covering and connections to radiators and risers, and must drip from the heater, as shown by arrows. In all one-pipe work it is best to keep the return pipe above the water line in the heater. The return pipe must have a true grade back to the heater. In the return pipe at the heater place an automatic air valve above the water line, which will relieve the return pipe of air and give a perfect circulation.

Fig. 4 shows steam and return connections at the end of the main pipe; also branch to radiator or riser from the end. This connection can be used on the end of a steam main, as it saves

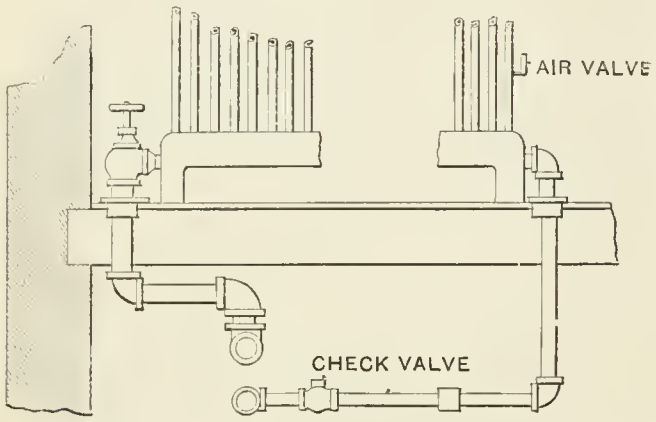


Fig. 1.—Two-Pipe Connection to Radiator.

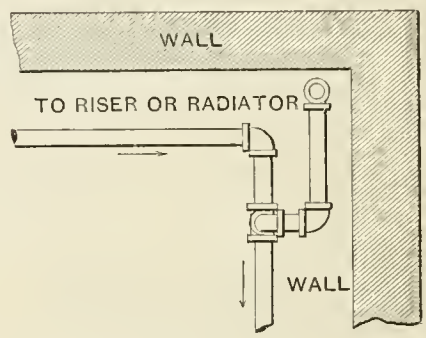

Fig. 2.—Connection to Corner Riser.

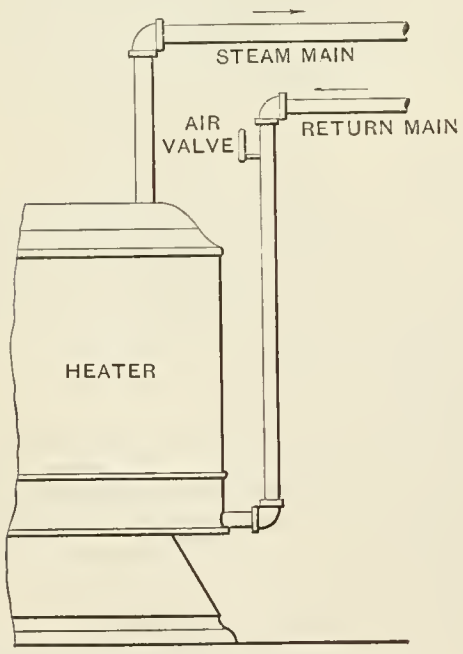

Fig. 3.—Heater Connections.

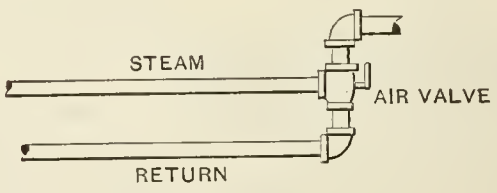

Fig. 4.—End Connections.

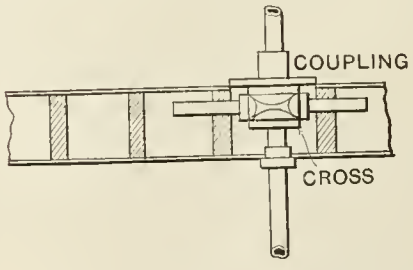

Fig. 5.—Riser Support for High Building.

placing a fitting in the main pipe and allowa a good drip from the branch pipe. Drill a hole in the fitting on the coupling on the riser and then slide over the riser across with side openings to take 1 or 1¼ inch pipe. Screw into

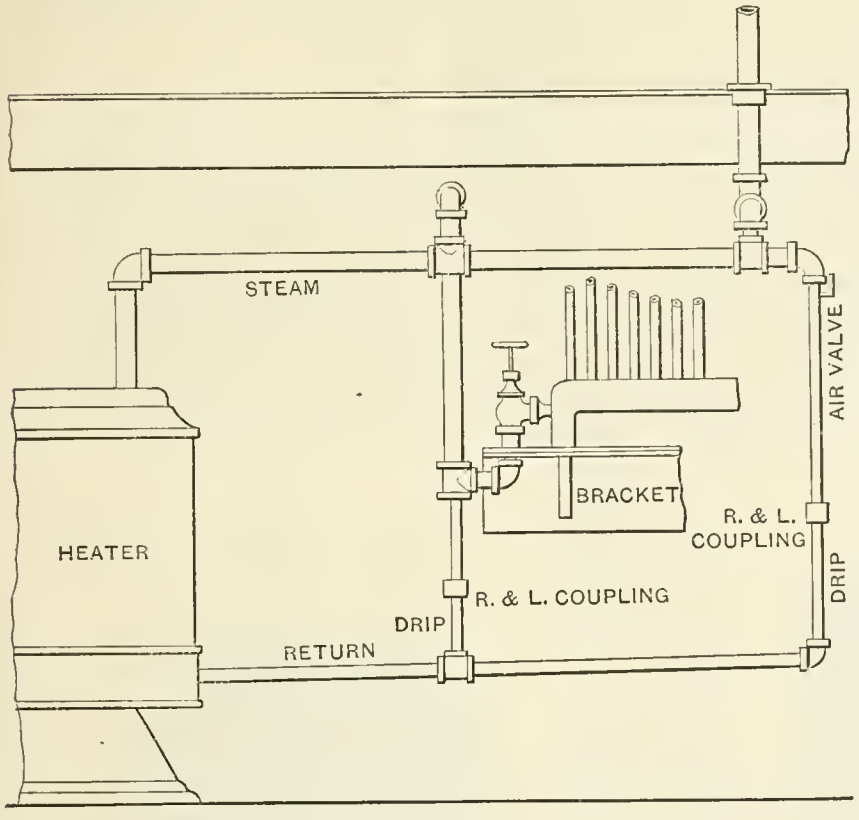

Fig. 6.—Connections for Radiator on Boiler Level.

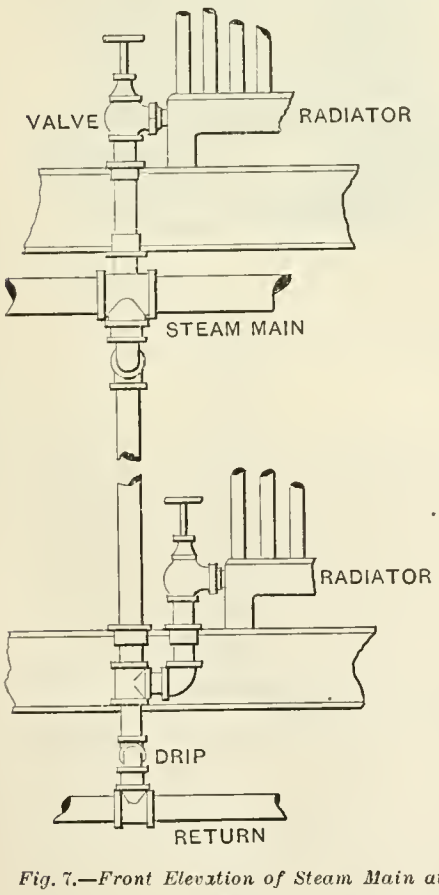

Fig. 7.—Front Elevation of Steam Main at Ceiling.

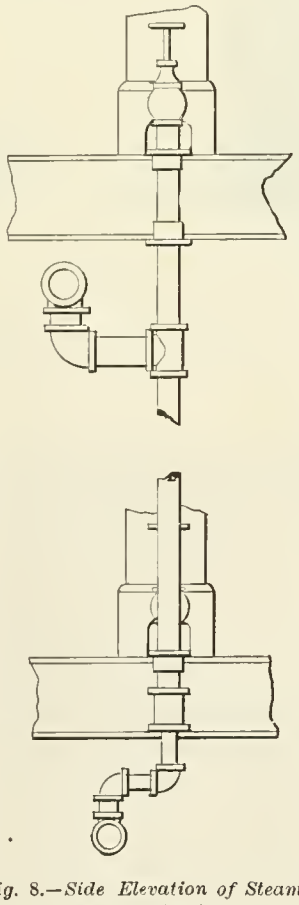

Fig. 8.—Side Elevation of Steam Main at Ceiling.

RADIATOR CONNECTIONS AND MAINS.

end of the main and place an automatic air valve.

Fig. 5 shows the manner of supporting riser in a high building. Place a the cross short pieces of pipe that will carry the weight of the riser, as shown in Fig. 5. This support must be placed in the middle of the riser, or as near as possible, so that it will hold the riser stationary at this point, and the expansion will be up and down from this support.

Fig. 6 shows the manner of connecting up a steam heating apparatus in a building where the boiler and radiation are all on the same floor. Run the main steam pipe close to the ceiling and take the branches from the top and turn down to the radiators, as shown in Fig. 6. This is done to allow for the expansion of the main pipe. The radiation, which is supported by brackets bolted to the walls of the building, is placed in position and connected up, as shown in Fig. 6.

Fig. 7 shows pipe connections to radiators in a building where there is not room under the first floor to run the steam main. The illustration shows the steam main run at the ceiling of the first floor, with branches up and down to the radiation and with the return main under the first floor.

Fig. 8 shows a side elevation of the connections shown in Fig. 7.

Furnace Coil in Conservatory.

From E. & H., *Oshawa, Ontario.*— We are pleased to see the Letter Box so interesting. It encourages all to show their own "hand" of ignorance, so that they may gain information thereby. In connection with a dwelling house in which we have placed a hot air furnace, the owner put up a conservatory, 40 x 12 x 7 feet high, forming a leanto against the east side of the dwelling, which he proposed to heat by hot water by placing a coil of pipe in the furnace. Now, what size coil will be required, or what rule is there for determining the amount of surface to be exposed to the fire to heat a given number of cubic feet of air?

Answer. — The application of the cubic foot rule in apportioning heating surface requires so much personal judgment, even in house heating, that many authorities discard it altogether. In greenhouse heating it is seldom or never used, the heating surface required being computed from the glass surface exposed, 1 square foot of heating surface being used for 2, 3 or 4 square feet of glass surface, according to the temperature of the water in the heating pipes. In the greenhouse mentioned there is, let us assume, an exposure of 760 square feet of glass surface, and in order to make sure of its being heated, with the water at a temperature of 160°, 1 square foot of heating surface will be calculated to heat 2½ square feet of glass surface. Consequently, about 300 square feet of heating surface will be required in the greenhouse. The heating capacity of coils placed in hot air furnaces varies very materially, so that the use of any rule to determine this has proved unsatisfactory, except when used with considerable judgment. An approximate rule, which has given satisfaction, is to allow 1 square foot of coil surface to 30 square feet of heating surface. In this case, a coil containing 10 square feet of surface would be required, and 2-inch pipe is the best size to use to connect with the piping necessary to supply the amount of heating surface required. About 1.6 lineal feet of 2-

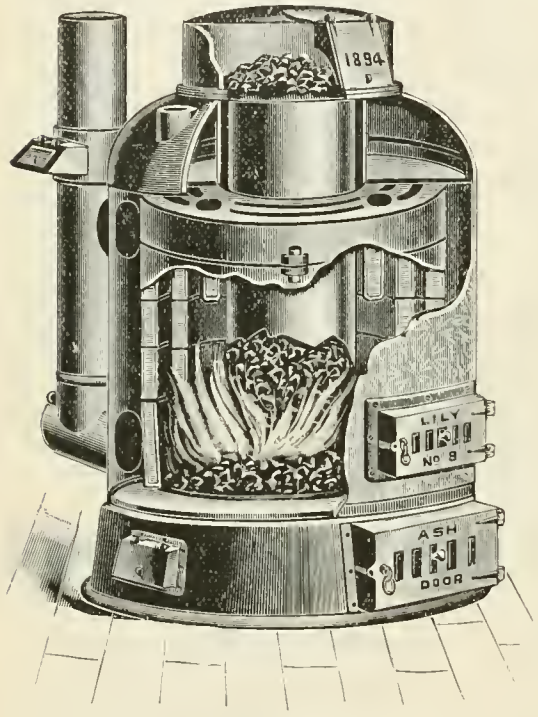
inch pipe are required to give a surface of 1 square foot. In heating greenhouses and conservatories the heating surface is generally placed in coils either along the walls or under the flower benches and less than 2-inch pipe is seldom used, while many advise the use of 4-inch pipe.

The New Lily Steam Heater

Rubel & Co., 114-116 Lake street, Chicago, are introducing the Lily steam heater, which is herewith illustrated in Figs. 1 and 2. It is constructed entirely of cast iron, and consists of from four to six hollow cast iron water sections and dome, circular in form, connected by three waterway openings and three oblong flues. These flues, as shown in Fig. 2, extend in and impinges against the broad surface or bottom of done. The fuel reservoir is unusually large, holding from 15 to 24 hours' fuel, and enabling the heater to carry steam for the same length of time. It is self feeding, and, it is said, does not clog up. In mild winter weather, with proper management, one filling is sufficient to generate steam for 24 hours. A 2-inch pipe containing a damper and leading from top of this fuel chamber to smoke pipe carries off any gas that might accumulate in it from the burning coal. The feeding door to the fuel reservoir is just above the steam dome, within convenient reach, and is of the type known as the side feed. The door is easily thrown back out of the way when supplying fuel. This heater also has a large feed door over fire pot so that it can be used as a surface feed if so desired. The fire is controlled by a check and jacket until they come in contact with the baffle plate, which is on top of the lower section; there they are turned forward then downward, passing around the fire pot to its rear, where they enter the smoke stack.

Wants a Heating System.

From C. F. S., *Trenton, Tenn.*—I have a customer who has a dry goods store, 125 x 22 feet and two stories high, that he wants heated by some other means than the common stove. The house is so located that a basement could be made, but my customer wants to avoid the cost of a basement. We have electric lights but no water works. What system of heating, under the circumstances, would you advise? My customer says he has read about stores being heated like sleeping cars. How are sleeping cars heated?



The New Lily Steam Heater.—Fig. 1.—*Broken View of Heater.*

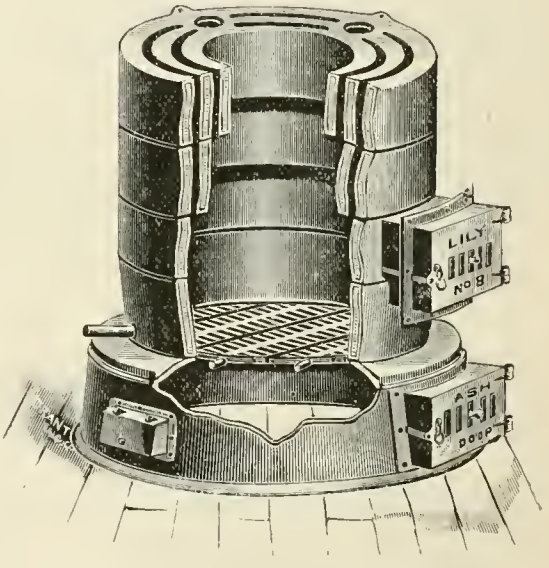


Fig. 2.—*Broken View with Casing Removed.*

length one third around the rings, being also extra large in width, creating a quick and positive draft through the heater, precluding, it is pointed out, any danger of clogging with soot or dust. The waterway openings in the several sections, when in place, directly above one another, constitute the means of communication for the water and steam between the several sections, and are of sufficient size to circulate the water freely through them. The lower section, or fire pot, which rests on the base, is conical in shape, being smallest at the bottom, and connects with the outer rim of the rings, thereby placing the flues of the sections resting on it directly over the fire, circulating the heat upward through the flues and interior of the heater while it is most intense. It is made in circular form, not divided, and is also a water section. Its communication with the other rings is through the three waterway openings described above. The steam dome, or top section surmounting these rings, is exceptionally large, and is used exclusively as a steam dome, no water being carried in it. The heat, as it is generated, passes up through the heater draft door, placed at the back in the smoke pipe, and a draft door on the base, which are attached to and operated by an automatic regulator capable of being adjusted to any desired pressure. A safety valve, guarding against an overpressure of steam, water gauge and steam gauge, registering the amount of pressure, and the necessary piping complete the fittings of the heater. The direct draft to be used in starting the fire is placed at the bottom of the dome connecting the top of the flues directly with the smoke stack and carrying off the accumulation of gas and smoke incident to the starting of fire. The grate is described as simple and easily operated by means of a shaking lever.

The heater is surrounded by three jackets, the inner one of black and the outer one of galvanized iron, the middle one being a heavy lining of asbestos. These three jackets are riveted together and are put on as one piece. The products of combustion pass up through the center of the heater and at the same time through the flues, then turn outward from the lower surface of the steam dome and descend downward through the space between the heater

Note.—Doubtless some of our friends in the trade can give this inquirer some acceptable method of heating a store. The discussion of heating radiators on the same level as the boiler which has been going on in the columns of *The Metal Worker* recently should be interesting to this correspondent, and we think, under the circumstances, that a hot water apparatus located at some convenient place in the store, and the piping run to radiators located advantageously, would make a satisfactory method of heating this building. Possibly an overhead steam system might be preferred. Sleeping cars, as a rule, are heated by steam.

A. G. King, Western manager of the Herendeen Mfg. Company, has removed from the Unity Building, 79 Dearborn street, to a large and more commodious office on the ground floor of 131 Lake street, Chicago. In the salesroom will be carried samples of the Furman boilers, brick set and portable, for steam

and hot water, together with a full line of radiators and steam fittings. The Herendeen Mfg. Company, we understand, have added to their business the manufacture of a line of horizontal tubular boilers for power and heating purposes.

School House Heating and Ventilation.

That a good atmosphere is as essential as a comfortable temperature in schools is a fact that is rapidly being accepted and put in practice, a case in evidence being the two large school houses recently erected at Johnstown, N. Y. The illustrations show the basement and two floors, with the heating and ventilating arrangements as installed by W. Lynes of that city. The hall and the rooms on one side of it only are shown in the illustrations, as the rooms on the other side of it are exactly like those shown. The heating in both school houses is done by steam from two No. 6 Gorton boilers, made by the Gorton & Lidgerwood Company, 96 Liberty street, New York. One of the boilers heats the halls in addition to the rooms above it, as shown in Fig. 1. Fig. 2 shows the arrangement of the first floor, with the location of the coils, radiators, registers and flues, and Fig. 3 shows the second floor. The heating is principally done by direct radiation, a 75-foot radiator being placed on each side of the lower hall, which is 66 feet long and 10 feet wide, and a 62-foot radiator being used at each side of the upper hall, which is of the same dimensions as the lower hall. A 32-foot radiator is used in the coat rooms, which are 38 x 10 feet. The four schoolrooms are each 26 x 34 feet and are warmed by wall coils extending along the exposed wall, each presenting 100 square feet of radiating surface and made of 1-inch pipe. In the basement are four stacks of indirect radiators, each containing 165 square feet, and are inclosed in a box lined with galvanized sheet iron and supplied with air from out of doors through a galvanized sheet iron duct, 12 x 12 inches. These indirect radiators connect with a tin lined flue 8 x 20 inches in size and lead to 16 x 20 inch registers in each room. By this means there is a constant inflow of fresh warm air, supplying a wholesome atmosphere for the pupils. The air in the room is drawn out to make room for the fresh air by means of ventilating flues, 20 x

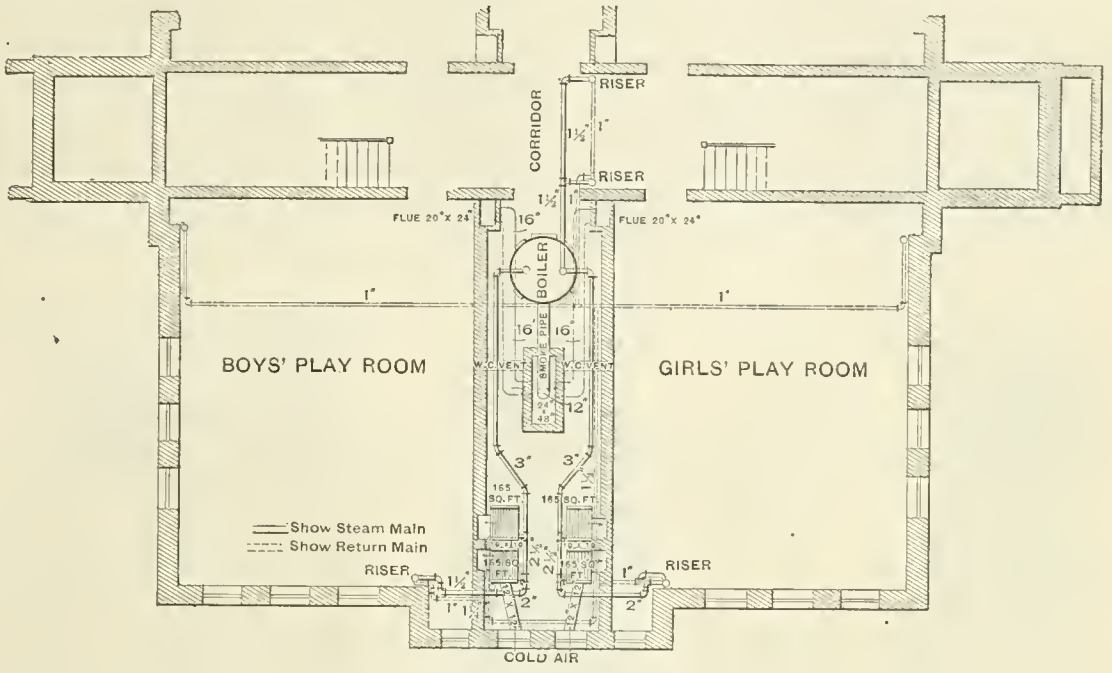

Fig. 1.—Showing Basement and Heating Plant.

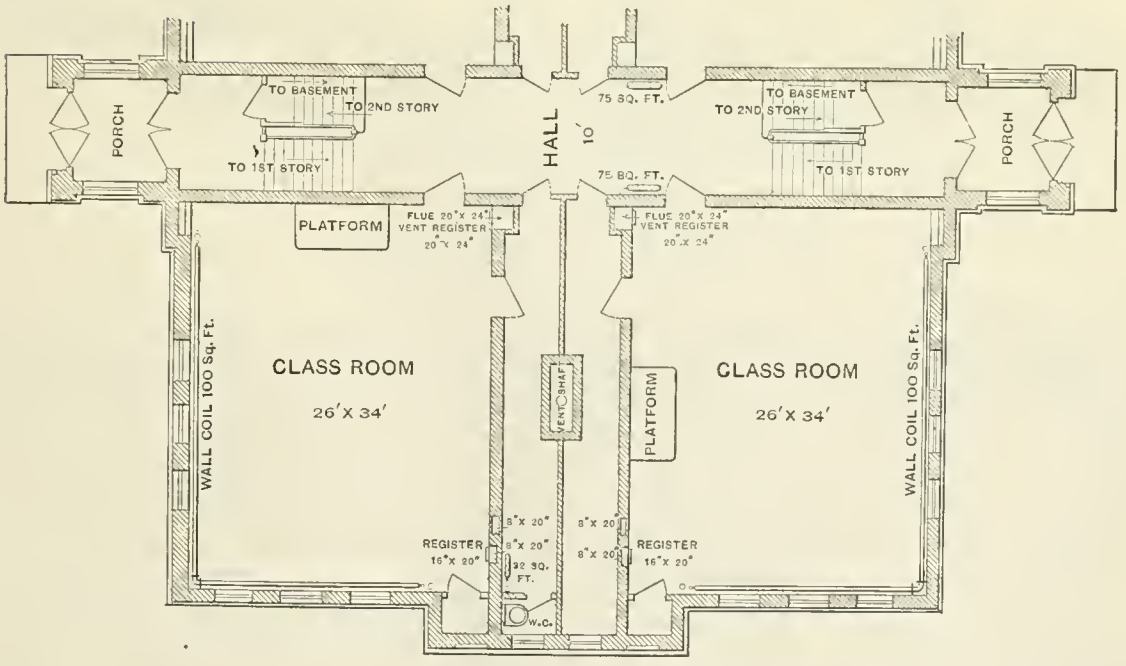

Fig. 2.—Showing First Floor.

24 inches, and having 20 x 24 inch registers in them, at the inner corner of the rooms, and connected by a 16 inch round pipe with the 24 x 48 inch ventilating shaft that runs up through the cost rooms. The ventilating registers in the lower rooms are connected with the ventilating shafts by the round pipes running down into the cellar and along under the floor, while those on the upper floor run up to the attic, and there extend over to the shaft. The ventilating shaft is heated by the smoke from the boiler entering a 12-inch smoke stack made of No. 12 iron that extends to the roof. A constant draft is maintained at each of the ventilating registers, and the air in the schoolrooms is being continually changed and freshened without the temperature being affected or disagreeable air currents being produced. The heating plant is of the gravity return system, the steam mains from the boiler being 3-inch and gradually reduced to 2½, 2, 1½ and 1¼ inches, while the return mains gradually increase from 1 inch to 1¼, 1½ and 2 inches at the boiler and no check valves are used on any part, ample relief being given to the system at various points.

A full open way valve is put on the return at the boiler, so that repairs can be made below the water line without emptying the boiler. The boilers and systems in both school houses have been thoroughly tested and an ample reserve capacity shown for colder weather than has yet come.

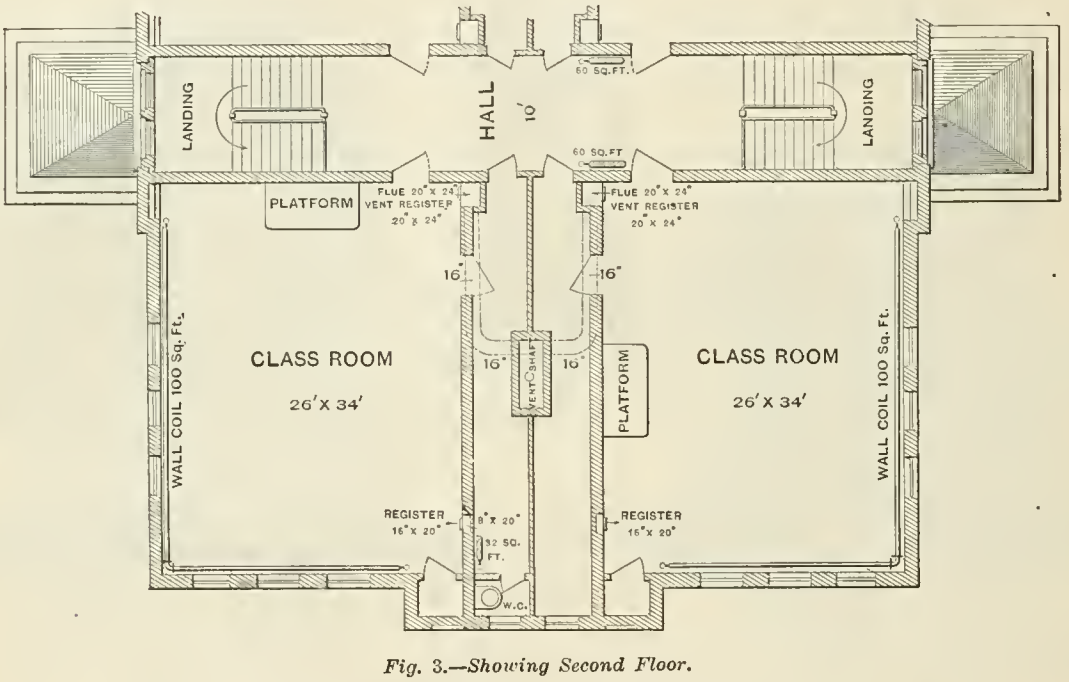

Fig. 3.—Showing Second Floor.

SCHOOL HOUSE HEATING AND VENTILATION.

HEATING NOTES.

TREASURER A. J. HAMMETT of the Richmond Stove Company, Norwich, Conn., was the guest of Higgins & Co., 379 Lexington avenue, New York, on Wednesday.

ANNOUNCEMENT is issued to the trade from St. Louis, Mo., under date of March 1, by John B. Hughes and H. W. Stone, that they have entered into a partnership, at 106 North Tenth street, under the name of Hughes & Stone, for the purpose of conducting a business for the construction of steam and hot water heating apparatus; also steam piping work in all its branches.

HIGGINS & Co., 379 Lexington avenue, New York, are issuing a 12-page catalogue in a yellow cover of the Richmond hot water heaters adapted for small work in stores, offices, conservatories, bathrooms and stables. Full page cuts show the methods of using them for conservatories and for furnishing a domestic hot water supply. This house make a specialty of house heating with hot air, hot water and steam, using the heaters of the Richmond Stove Company of Norwich, Conn., and have their showroom arranged with the Richmond and Victor heaters displayed so that the construction and operation can be readily seen. One of the Victor boilers is shown with parts cut away so that the interior is exposed to view, and a novel feature of a Richmond return flue sectional is that the sides are painted in colors to represent fire, showing exactly the passage of the flame through it. In addition to their New York store, convenient to the Grand Central Station, Higgins & Co. have another store and construction shop at Mount Vernon, N. Y. Their interests and those of the Richmond Stove Company with the trade in the vicinity of New York are cared for by A. S. Mappett.

THE J. L. MOTT IRON WORKS, 84-90 Beekman street, New York, and 311-313 Wabash avenue, Chicago, have been so successful with their line of Sunray hot water heaters, Nos. 22 to 25, that they have just added two sizes to their list—Nos. 26 and 27. These heaters are used extensively for supplying water for hotels, apartment houses, and for heating small houses, are of modern construction and have grates that are perfect in operation. They report that the larger sizes of the Sunray hot water heaters, Nos. 1 to 12, are meeting with a very favorable reception.

THE UNITED STATES HEATER COMPANY, Detroit and Chicago, send out advertising cards of the pictorial sort, calling attention to the Capitol and Hecla heaters of their manufacture. The design in this instance is a Capitol heater on which sits, perhaps a traveling salesman, blindfolded like Justice, and holding scales suspended from his right hand, with which to weigh the advantages and defects of different constructions of boilers. Down either side of the central figure are ranged the advantages and defects of both cast and wrought iron, the intimation being that the defects are absent, and the advantages present in the Hecla and Capitol heaters.

THE AMERICAN RADIATOR COMPANY, 111-113 Lake street, Chicago, have lately received a large order for Excelsior indirect radiation to be shipped to Newcastle-upon-Tyne, England.

THE MASTER STEAM AND HOT WATER FITTERS of the State of Michigan, held their annual meeting February 28, at Grand Rapids. The annual election resulted in choosing the following officers for the current year: President, C. W. Light, Saginaw; secretary, J. A. Wheeler, Kalamazoo; treasurer, James Meathe, Detroit. The only important matter considered by the delegates was the question of becoming allied with the National Association. After some discussion it was decided to take a membership in the national body. The president deferred the appointment of an Executive Committee until a future time. This association will hold its next State meeting at Bay City with the master plumbers.

AT A MEETING held recently of the National Hot Water Heating Company, the following officers were elected: George E. Downe, president; Daniel Simonds, vice-president; William H. Oakes, secretary, and Frank G. Webber, treasurer

PETZOID & HARTUNG, 708-710 East 167th street, New York, are the agents for the bronzes made by Leo Haenle, Munich, Bavaria. In addition to a varied line of radiator bronzes in different colors they are offering an aluminum bronze, which, it is claimed, is superior to silver bronze in both brilliancy and durability, and is not affected by heat.

A Detroit millionaire will, it is stated, establish a co operative colony.

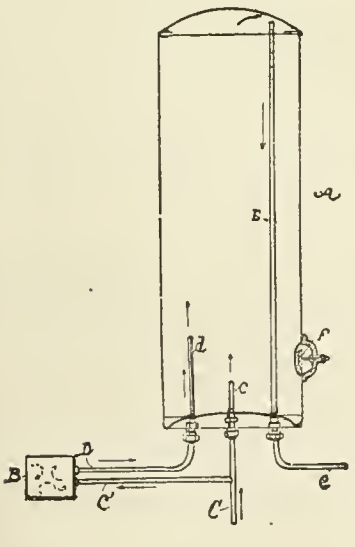
PLUMBING and GAS FITTING.

Michigan State Plumbers.

At the convention of master plumbers of the State of Michigan, at Grand Rapids, February 27 and 28, the president, James Meathe, in his address, recounted the benefits that had resulted from co-operation, and reported an increase of 500 members in the National Association since the Milwaukee Convention. The passage of a State law to regulate plumbing was discussed, after which the following officers were elected: President, James Meathe, Detroit; vice-president, S. J. Wirtz, Jackson; treasurer, John A. Wheeler, Kalamazoo; secretary, F. C. Bennett, Lansing; assistant secretary, Benjamin F. Guiney, Detroit. Executive Committee, W. C. Weatherly, Grand Rapids; J. Bradley, Port Huron; J. H. Crumley, Detroit. Sanitary Committee, J. H. Crumley, Detroit; Robert Sproul, Grand Rapids; Wm. W. Armstrong, Lansing. Legislative Committee, Robert Sproul, Grand Rapids; F. Schriver, Grand Rapids; S. J. Wirtz, Jackson. Apprentice Committee, F. Hutzel, Ann Arbor; Frank Walsh, Detroit; W. H. Sullivan, Bay City. The next State convention will be held at Bay City.

The Norristown Range Boiler.

The Norristown Range Boiler Works of 416 Walnut and 501 Chestnut streets, Philadelphia, Pa., are putting on the market the range boiler shown in the



The Norristown Range Boiler.—Sectional View.

accompanying cut. The boiler is claimed to possess the following advantages: It has no holes for connections on top; no pipes appear on the outside of the boiler; three pipes only are used instead of four, as in the case of the ordinary boiler, a saving of material and labor in making connections; it may be located in positions not suited to the ordinary boiler. The cold water pipe C enters the bottom of the boiler and extends upward 6 inches. The cold water supply to water back B is taken from pipe C. The circulating pipe D enters the boiler at bottom and extends upward 24 inches. The hot water delivery pipe E extends to within 2 inches of top of boiler. F is a hand hole for cleaning out sediment.

A Reinforced Lead Pipe.

A new style of lead pipe is illustrated in the London *Ironmonger* and reproduced here. It has been patented by G. Wakefield Fox, 104 Dickenson road, Rusholme, Manchester, England, and

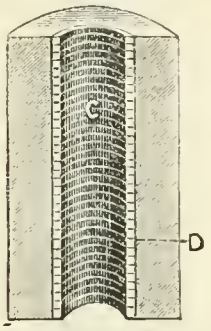


Fig. 1.—Coil on Inner Surface of Pipe.

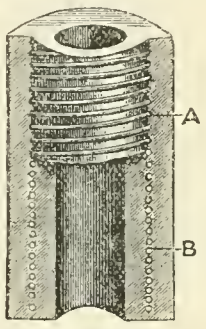

Fig. 2.—Coil Imbedded in Pipe.

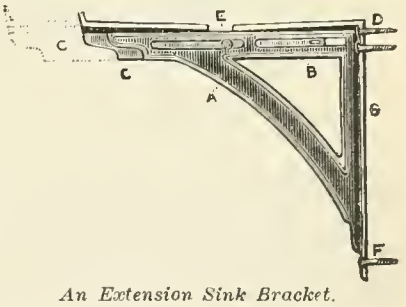
A REINFORCED LEAD PIPE.

consists of a lead or tin pipe with an internal coil of round or square wire either partly or wholly imbedded in the walls of the pipe, as shown by the illustrations, Figs. 1 and 2. It is claimed that the quantity of metal used can be reduced and the pipe yet be stronger, and that the pipe furthermore can be readily bent without collapsing. This pipe may be made with a lining of tinned iron or copper wire, to take the place of tin lined pipe. In the process of manufacturing this form of piping the wire, which, for general purposes, is tinned iron or steel, is run off a reel, or otherwise, above and down the center of a revolving hollow mandrel, coming out at the bottom through an eye or aperture in the side at the junction of the mandrel and the core, and as the metal is pressed through between the die and the core it carries the wire with it in regular coils, fed from the revolving mandrel, the wire becoming imbedded in the walls of the pipe as it is being made. By varying the position of the eye in the revolving hollow mandrel, the wire may be either wholly or partially imbedded in the walls of the pipe, and the revolving mandrel may be applied to cylinders, having either upward or downward pressure. The piping can be cut by a fine saw. Cross joints are made by cutting the lead down to the wire, then filing through with a round rough file, and end joints by paring one end on the outside and the other on the inside down to the wire, then cutting the latter through in three places with a narrow fine saw or edge file, and forcing the pipe open with a plug.

An Extension Sink Bracket.

James Gray, East Albany, N. Y., has patented an extension sink bracket, shown in the illustration. It can be adjusted to fit any size of sink from 14 x 20 to 20 x 40 inches, and is arranged to meet irregularities in the shape of the bottom of the sink and to hold the sink securely in place. The bracket has an extension slide which is provided with lugs which work in slots in the bracket, and the two parts are secured at any point desired by a bolt. The bracket is provided with four screw holes at the top, to enable it to be securely fastened. In the cut, E shows the bracket partly extended, and the dotted lines C show it fully opened. A and B show the slots for the lug and bolt to work in, and D and F show the location of the screw holes in the back G. A variety of ornamental cast iron sink and slab brackets in one piece are also made by Mr.



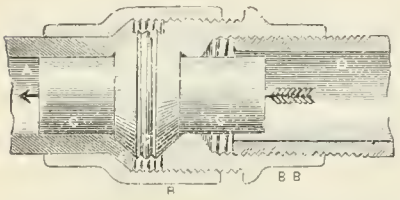
An Extension Sink Bracket.

Gray, and his line of goods is sold by the plumbing supply house of C. Hoffman, Jr., 281 Pearl street, New York.

THE SHORT TIME REQUIRED for erecting a stack of wrought iron house drain, where everything is convenient, is shown by the work of the men of Rossman & Bracken, plumbers, of 387 Lexington avenue, New York. In a 13-story building on Maiden Lane a stack 180 feet in hight was put up in less than two days. With cast iron pipe, more than twice as much time, it is said, would have been necessary.

Star Water Back and Boiler Coupler.

The accompanying illustrations show a water back and boiler coupler, put on the market by the Star Coupler Company, 801 Wainwright Building, St. Louis, Mo. Sectional views of the coupler are shown in Figs. 1 and 2,



Star Water Back and Boiler Coupler.—Fig. 1.—Sectional View Through Lead to Iron Coupling.

the former illustrating its application to lead and iron pipe, and the other showing how it is used to join two ends of lead pipe. Fig. 3 is the swedging tool and Fig. 4 is the grasping and bending tool used in the application of the coupler. Referring to the let-

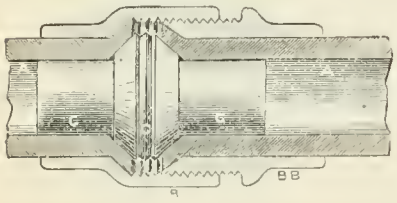


Fig. 2.—Sectional View through Lead to Lead Coupling.

ters on the engravings, A is the lead pipe and B the female part of the coupling, while B B is the male part of the coupling. C is the tubular cone, with gum washers, and D the iron pipe. In connecting iron to lead pipe the lead pipe is cut and bent to fit the connec-

Fig. 3.—Swedging Tool.

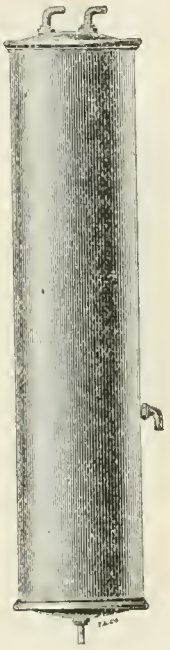
tions and each end trimmed out slanting by about one-half its thickness with tap borer or knife. The female parts of the couplings B are passed over the lead pipe A, and then each end of the pipe is swedged, the tubular cone and gum washers C being placed between the

Fig. 4.—Grasping and Bending Tool.

swedged ends of the lead pipe A and the male coupling B B. Next the male and female couplings are brought together to start the threads; then by means of a monkey wrench a complete joint is securely formed. The ends of the male part of lead to iron couplings, B B, are of standard size, with screw threads cut on the inside for direct connection to all the sizes of water backs and secured to boilers by the use of proper size of nipple or spud. These couplings do away with the necessity of soldering or wiping joints and make, it is claimed, absolutely air and water tight connections. The lead to iron couplings are made for $\frac{5}{8}$ and $\frac{3}{4}$ inch lead and $\frac{3}{4}$, 1 and $1\frac{1}{4}$ inch iron pipe, while the lead to lead couplings are made for $\frac{5}{8}$ and $\frac{3}{4}$ inch pipes.

The Resisto Range Boiler.

We show in the accompanying illustration a general view of a range boiler put on the market by the Booth Copper



The Resisto Range Boiler.

Company, Toronto, Canada. This boiler, which is made of copper, is specially designed to stand a high pressure, up to 200 pounds, and at the same time be reasonable in price. The feature of it is the method of fastening in the heads, no rivets being used. The boiler head is made of sheet copper, having an upwardly projecting edge. The head is fitted into the cylinder and pressed down about $\frac{5}{8}$ inch, the projecting part of the cylinder being turned over, squeezed against the head flange and soldered. After this joint is pressed down a malleable iron ring with a groove in the bottom forces the joint tightly together and holds it against the internal pressure of the boiler. This ring also takes all strain from the soldered joint, and, it is claimed, gives the boiler the strength to withstand at least 200 pounds hydraulic pressure. This special feature of the boiler is covered by United States and Canadian patents. The boiler is also strengthened on the inside to prevent collapsing from vacuum. At present the Resisto boilers are made in the 30-gallon size.

THE PLUMBING ORDINANCE of Holyoke, Mass., has been printed in pamphlet form with Chapter 477 of the statutes which governs the licensing of plumbers. Inspector Joseph Murray has been supplied with all of the blanks and books necessary for keeping the records required. He is examining the plumbing in tenement houses and having some necessary changes made.

New Hampshire Master Plumbers.

At the annual convention of the New Hampshire master plumbers, at Manchester, February 22, President Robert J. Donnelly made the opening address and introduced National President D. G. Finnerty. The principal business was the consideration of the proposed State plumbing law. The following special Legislative Committee was appointed to advance the interests of the proposed law: Robert J. Donnelly and J. Davis of Keene, P. Clifford of Concord, and H. Wolfe and F. A. Lane of Manchester, J. P. Sweetzer of Portsmouth and F. O. Ray of Nashua. President Donnelly suggested that the State be divided into four sections, owing to the distance that some members had to travel to attend the meeting, and further suggested that sectional meetings be held monthly and State meetings semi annually. The suggestions were considered and adopted.

The following officers were elected to serve for the ensuing year: President, Frank Lane, Manchester; vice-president, P. Clifford, Concord; financial secretary, Jno. F. Larkin, Manchester; recording and corresponding secretary, Frank Lessard, Manchester; treasurer, H. R. Pike, Manchester. The following were elected delegates to attend the twelfth annual national convention in Detroit, June 19, 20 and 21: Frank Lane, F. Lessard, P. Clifford. The convention adjourned to meet in Portsmouth on May 30, 1894.

TRAPS AND VENTS.
